THE ENCYCLOPÆDIA BRITANNICA FOURTEENTH EDITION

VOLUME 9 EXTRACTION TO GAMBRINUS

EXTRACTION, in a broad sense, is any process for separating a desired constituent from a mass, whether of solids or liquids. Mechanical expression, shaking or "percolating" with a cold solvent, treating with a hot solvent condensed from its vapour, are amongst the methods used. Examples of extractions are the separation of active principles from drugs, and the treatment of gold ore with cyanide solutions.

EXTRADITION is the handing over of a fugitive from justice by the country in which he is found to the country demanding him. (The meaning of the word "fugitive criminal," used in the Extradition Act 1870, was considered in *R. v. Godfrey* [1923] 1 K.B. 24, where it was laid down that a person, alleged to have committed a crime in a foreign country which seeks his extradition from this country, need not have been physically present in the foreign country at the time of the alleged offence for him to be a "fugitive criminal" within the meaning of s. 26 of the Act.) Is a country, apart from treaty, bound to deliver up to the country of the place of commission of the alleged crime a fugitive from justice? The ideal international convention is one like the Universal Postal Union, in which all nations are equally interested. Such a matter likewise is the suppression of crime but this matter had no urgency until the enormous development of transport facilities during the 19th century. In bygone times common criminals rarely had the opportunity of escaping but so called political criminals sometimes succeeded and these were often given up, treaty or no treaty. Grotius held that it is the duty of a State either to surrender, or itself to punish, fugitive criminals; but he seems to confuse fact and theory. Now a State manifestly cannot agree with other nations to do what its own laws do not allow it to do. The reluctance of Great Britain to deliver up fugitives and her readiness to grant asylum (*q.v.*) proceeded perhaps from a belief, not only by herself but by foreign observers, in the superiority of her institutions; but the almost universal adoption of representative government in recent times has made this championship of the oppressed perhaps unnecessary and certainly embarrassing. As an example of the old state of affairs, some Spanish convicts were wrecked in 1836 on the Bahama islands and the governor detained them awaiting the opinion of the attorney-general and the solicitor-general in England as to whether he should deliver them up to Spain: he was advised that by the law of England he

could not do so. In 1841 some negro slaves mutinied and murdered a passenger in the brig "Creole" and took the ship to the West Indies. At the request of the American consul the governor put a guard on board but refused to give the prisoners up to the American Government. Nineteen were tried locally for piracy and acquitted. The law authorities in England were unanimously of the opinion that they could not be given up in the absence of an act of parliament giving power to the executive. At this time France had extradition treaties with Spain, Switzerland, Belgium and Sardinia and could obtain extradition from other countries, without treaties, but not from Great Britain or the United States; from Great Britain because her laws did not allow it; from the United States because it was not then settled whether the power resided in the constituent States or in the Union. By giving effect in 1843 to the Ashburton Treaty with the United States this power was first given to the English executive. The previous chapter of the act (6 and 7 Vic. c. 75) carried into effect a treaty with France which had been signed in the same year (1843).

Extradition Treaties.—Great Britain has extradition treaties with the following countries: Austria (Sept. 22, 1920); Austria Hungary (Dec. 3, 1873; June 26, 1901); Argentine republic (May 22, 1889); Belgium (Oct. 29, 1901; March 5, 1907; March 3, 1911; Aug. 8, 1923); Bolivia (Feb. 22, 1892); Brazil (Nov. 13, 1872); Bulgaria (Jan. 26, 1897); Chile (Nov. 11, 1924); Czechoslovakia (June 4, 1926); China (March 1, 1894); Colombia (Oct. 27, 1888); Cuba (Oct. 3, 1904); Denmark (March 31, 1873); Ecuador (Sept. 20, 1880); Esthonia (Nov. 18, 1925); Finland (May 30, 1924; Nov. 25, 1926); France (Aug. 14, 1876; Dec. 31, 1889; Feb. 13, 1896; Oct. 17, 1908; Nov. 13, 1923); Germany (May 14, 1872; May 5, 1894; Jan. 30, 1911; Sept. 1, 1913; June 25, 1920); Greece (Sept. 24, 1910); Guatemala (July 4, 1885; May 30, 1914); Haiti (Dec. 7, 1874); Hungary (Oct. 24, 1921); Italy (Feb. 5, 1873; May 7, 1873); Latvia (July 16, 1924); Liberia (Dec. 16, 1892); Lithuania (May 18, 1926); Luxemburg (Nov. 24, 1880); Mexico (Sept. 7, 1886); Monaco (Dec. 17, 1891); Netherlands (Sept. 26, 1898; Aug. 17, 1914; April 13, 1920); Nicaragua (April 19, 1905); Norway (Feb. 18, 1907); Panama (Aug. 25, 1906); Paraguay (Sept. 12, 1908); Peru (Jan. 26, 1904); Poland; Portugal (Oct. 17, 1892; Nov. 30, 1892; Jan. 10, 1921); Rumania (March 21, 1893); Russia (Nov. 24, 1886); Salvador (June 23, 1881); San Marino (Oct. 16, 1899); Serbia (Dec. 6, 1900); Siam (Sept. 3, 1883; Nov. 30, 1885; March 4, 1911); Spain (June 4, 1878; Feb. 19, 1889; June 20, 1919);

Switzerland (Nov. 26, 1880; June 29, 1904; July 14, 1920); Sweden and Norway (June 26, 1873); Sweden (July 2, 1907); Tonga (Nov. 29, 1879); Turkey; United States (Aug. 9, 1842; July 12, 1889; Dec. 13, 1900; April 12, 1905; May 15, 1922); Uruguay (March 26, 1884; March 20, 1891).

It has been said that two things stand in the way of the proposals for uniformity in this matter which have been made from time to time: (1) the variation in the definition of crimes in different countries; (2) the fear that extradition may be made use of in order to get hold of a fugitive who is wanted by his country, not really for a criminal but for a political offence. The first difficulty is doubtless considerable but it is by no means insuperable.

Two propositions seem fundamental: (1) every State can insist that in the whole extent of its territory no laws but its own shall be recognized; (2) no State should extend beyond its own territory the application of its own penal laws. To hold otherwise is in effect to demand extraterritoriality (*q.v.*) which can only be demanded of uncivilized nations. The criteria of civilization, it is submitted, are the rule of law (*q.v.*) and the impartial administration of justice; subsidiary considerations perhaps are the incidence of crimes of violence and the status of women. A simpler way of putting it is that some countries have not the same way of looking at things as others have. If the above propositions are sound it follows that a State ought to give up its own nationals, properly accused of having committed a crime abroad; but many countries still refuse to deliver their own nationals, though the better practice would seem to be to make the matter optional. Treaties with the following nations reciprocally refuse the extradition of their own subjects: Austria, Brazil, Denmark, Germany, Greece, Guatemala, Haiti, Hungary, Italy, Nicaragua, Norway, Portugal, Salvador, Sweden and Norway, and Uruguay. In the case of the following the surrender is optional: Argentine, Belgium, Bolivia, Chile, China, Colombia, Cuba, Czechoslovakia, Ecuador, Estonia, France, Finland, Latvia, Liberia, Lithuania, Luxembourg, Mexico, Monaco, Netherlands, Panama, Paraguay, Peru, Rumania, Russia, San Marino, Serbia, Siam, Spain, Switzerland, Tonga, United States. Spain, Switzerland and Luxemburg, in their treaties with Great Britain, refuse the extradition of their own subjects, but Great Britain is free to surrender hers to them, subject of course to the restrictions governing all surrenders, contained in s. 3 of the Extradition Act of 1870. One of these restrictions is that the offence must not be of a political character nor must the requisition have been made with a view to punish a fugitive for an offence of a political character.

Political Offences.—There are not lacking signs that countries once the champions of revolution in any other country but their own are beginning to think better of it and to wonder whether it is not the interest of each member of the family of nations if not to support at least not to hinder the rest in their task of keeping order within their own borders; especially when so-called political offences involve murder and other heinous crimes. In two treaties concluded by Italy in 1922 (with Czechoslovakia and Yugoslavia) it was agreed not to give up political offenders unless the Act constitutes a "common crime." All attempts to lay down hard and fast rules as to what constitutes a political crime have hitherto failed and each case must be decided on its merits: a method familiar to us. It was decided in *Castioni's case* [1891], 1 Q.B. 149, that such an offence must be "incidental to and form part of political disturbances." In *Meunier's case* [1894], 2 Q.B. 415, it was held that a political act must be directed against a particular state or government as distinguished from society at large. With regard however to the provision that a requisition must not be made with a view to try and punish for an offence of a political character a fugitive whose extradition is demanded on other grounds, it was held in *Arton's case*, 1896, 1 Q.B. 509, amongst other things, that the court had no jurisdiction to question the good faith of a friendly Power.

Extraditable offences in general are those considered heinous by the consensus of opinion of mankind, though there are some notable omissions in some treaties, particularly with respect to sexual offences. Participation in or attempt or conspiracy to

commit such crimes is not covered by all treaties by any means. It is interesting to note that Rumania may refuse, and Portugal does refuse, to surrender where capital punishment (*q.v.*) may be inflicted. Some countries refuse to extradite if prescription (*q.v.*) has been acquired; such, for example, is the case with France after six years.

The procedure in extradition cases is in general not complicated though some countries fail to realize, with regard to Great Britain, the implications of the presumption of innocence and do not support their application by sufficient evidence, that is to say, the original warrant must have been obtained by evidence on oath—or affirmation where English law allows it—and must not be hearsay. The requisition is made through the regular diplomatic channels.

The return of fugitives within the British empire—that is to say between the home country and the dominions and colonies and between the dominions and colonies themselves—is not technically called extradition and is governed by the Fugitive Offenders' Act 1881.

See Clarke on *Extradition* (4th ed., 1904); Oppenheim, *International Law*, vol. i. (4th ed., 1928); Pitt Cobbett's *Cases on International Law*, 5th ed., vol. i. (F. T. G.)

United States.—In the absence of treaty, the United States has consistently refused to surrender fugitive criminals. Beginning with the Jay Treaty of Nov. 19, 1794, numerous extradition treaties have been concluded between the United States and other civilized nations. Recent treaties have tended to broaden the scope of extraditable offences, the convention with France of 1909 making breach of trust under certain circumstances by a person acting in a fiduciary capacity an extraditable offence. Political offences are excepted from the provisions of these treaties either in express terms or by implication. Most treaties in express terms except nationals of the State of asylum from their provisions. In the absence of such an express provision the United States has taken the position that nationals of both contracting parties are extraditable.

The commitment of the person sought to be extradited is effected by resort to judicial authority. Specific provision has been made since 1845 by act of Congress for the procedure to be followed in extradition proceedings. Any Federal judge, U.S. commissioner, or judge of a court of record of general jurisdiction of any State, may act as a committing magistrate, issuing warrants of arrest and passing upon the sufficiency of the evidence to establish the crime charged. His function is not to determine the ultimate guilt of the fugitive but simply to determine whether the evidence is sufficient to warrant trial before the courts of the demanding country, together with the question of whether the offence charged comes within the applicable treaty provisions. The determination of whether the offence is of a political character is consequently a judicial function. To establish a political offence it is necessary to show that the accused was connected with an uprising of a revolutionary character in the demanding State and that the acts charged were incidental to his participation in the movement. The jurisdiction of the committing magistrate can be reviewed by *habeas corpus*, but such review extends only to the sufficiency of the evidence and not to the correctness of the magistrate's conclusions therefrom. A revisory power over the final commitment is possessed by the Secretary of State of the United States, but such power is exercised within very narrow limits.

In contradistinction to interstate rendition, U.S. courts can try an extradited criminal only for the offence with which he was charged in the extradition proceedings, unless reasonable time has been given him after his release to return to the country from which he was extradited.

Interstate extradition rests upon the provisions of Article IV., Sect. 2, of the Constitution of the United States, which requires a State to which a person charged with "treason, felony, or other crime" in another State has fled to surrender him upon the demand of the latter State. Legislation necessary to carry the constitutional provisions into execution was enacted by Congress in 1793. The extraditable offences are not limited to serious felonies but include all acts made criminal by the demanding

State. By the rules adopted by the International Extradition Conference of 1877 requisitions for petty offences, however, are not to be honoured save in exceptional circumstances. Interstate extradition differs from international extradition primarily in two particulars: the duty of the State asylum to surrender the fugitive does not rest on treaty or comity but upon the imperative command of the Constitution; the proceedings relating to interstate extradition are informal in character, conducted before the executive, no hearing being required and the executive being enabled to act even in the absence of the accused and without notice to him.

See Hyde, *International Law*; Moore, *Extradition and Interstate Rendition*; Hawley, *Law and Practice of International Extradition*. (J. M. LA.)

EXTRADOS, in architecture, the top or upper surface of the series of wedge-shaped stones (*voussoirs*) of which an arch is composed. (See illustration under **ARCH**.) The term is usually confined to those cases in which the upper sides of the *voussoirs* form a continuous curve.

EXTRAPOLATION: see **INTERPOLATION**.

EXTRAVAGANZA, a work for the stage of a go-as-you-please type, which is generally distinguished further by the lavishness and extravagance of its scenery and dresses. The term is also applied sometimes to musical and literary compositions of a humorous and burlesque order.

EXTREME UNCTION, a sacrament of the Catholic Church. It has been general since the 9th century. The Council of Florence A.D. 1439 thus defined it:—

"The fifth sacrament is extreme unction. Its matter is olive oil, blessed by a bishop. It shall not be given except to a sick person whose death is apprehended. He shall be anointed in the following places: the eyes, ears, nostrils, mouth, hands, feet, reins. The form of the sacrament is this: Through this anointing of thee and through its most pious mercy, be forgiven all thy sins of sight, etc. . . . and so in respect of the other organs. A priest can administer this sacrament. But its effect is to make whole the mind, and, so far as it is expedient, the body as well."

This sacrament supplements that of penance (*viz.*, remission of post-baptismal sin) in the sense that any guilt unconfessed or left over after normal penances imposed by confessors is purged thereby. It was discussed in the 12th century whether this sacrament is indelible like baptism, or whether it can be repeated; and the latter view, that of Peter Lombard, prevailed.

It was a popular opinion in the middle ages that extreme unction extinguishes all ties and links with this world, so that he who has received it must, if he recovers, renounce the eating of flesh and matrimonial relations. Such opinions, combated by bishops and councils, were due to the influence of the *consolamentum* of the Cathars (*q.v.*). In both sacraments the death-bed baptism of an earlier age seems to survive, and they both fulfil a deep-seated need of the human spirit.

EYBESCHÜTZ, JONATHAN (1690–1764), German rabbi, was from 1750 rabbi in Altona. A man of erudition and personality, Eybeschütz became specially notorious because of a curious controversy concerning the amulets which he was suspected of issuing. These amulets recognized the Messianic claims of Sabbatai Sebi (*q.v.*), and a famous rabbinic contemporary of Eybeschütz, Jacob Emden, boldly accused him of heresy. Though there is insufficient evidence against Eybeschütz, Emden may be credited with having crushed the lingering belief in Sabbatai current even in some orthodox circles. For a list of Eybeschütz's works see *Jewish Encyclopedia*.

EYCK, VAN, the name of a family of Flemish painters in whose works the rise and mature development of art in western Flanders are represented. Though bred in the valley of the Meuse, they established their professional domicile in Ghent and in Bruges; and there, by skill and inventive genius, introduced a complete revolution into the technical methods of execution familiar to their countrymen.

1. **HUBERT (Huybrecht) VAN EYCK** (?1366–1426) was the oldest and most remarkable of this race of artists. The date of his birth and the records of his progress are lost. Hubert was born

about 1366, at Maeseyck, under the shelter or protection of a Benedictine convent. But the schools which had flourished in the towns having decayed, the artist wandered to Flanders, and there for the first time gained a name. As court painter to the hereditary prince of Burgundy, and as client to one of the richest of the Ghent patricians, Hubert is celebrated. Here, in middle age, between 1410 and 1420, he signalized himself as the inventor of a new method of painting. Here he lived in the pay of Philip of Charolais till 1421. Here he painted pictures for the corporation, whose chief magistrates honoured him with a state visit in 1424. His principal masterpiece, the "Worship of the Lamb," at St. Bavon in Ghent,¹ commissioned by Jodocus Vijds, lord of Pamele, is the noblest creation of the Flemish school, one upon which Hubert laboured till he died, leaving it to be completed by his brother. Almost unique as an illustration of contemporary feeling for Christian art, this great composition can only be matched by the "Fount of Salvation," in the museum of Madrid. It represents, on numerous panels, Christ on the judgment seat, with the Virgin and St. John the Baptist at His sides, hearing the songs of the angels, and contemplated by Adam and Eve, and, beneath Him the Lamb shedding His blood in the presence of angels, apostles, prophets, martyrs, knights and hermits. On the outer sides of the panels are the Virgin and the angel annunciate, the sibyls and prophets who foretold the coming of the Lord, and the donors in prayer at the feet of the Baptist and Evangelist. After this great work was finished it was placed, in 1432, on an altar in St. Bavon of Ghent, with an inscription on the framework describing Hubert as "maior quo nemo repertus," and setting forth, in colours as imperishable as the picture itself, that Hubert began and John afterwards brought it to perfection. John van Eyck certainly wished to guard against an error which ill-informed posterity showed itself but too prone to foster, the error that he alone had composed and carried out an altarpiece executed jointly by Hubert and himself. His contemporaries may be credited with full knowledge of the truth in this respect, and the facts were equally well known to the duke of Burgundy or the chiefs of the corporation of Bruges, who visited the painter's house in state in 1432, and the members of the chamber of rhetoric at Ghent, who reproduced the *Agnus Dei* as a *tableau vivant* in 1456. Yet a later generation of Flemings forgot the claims of Hubert and gave the honours that were his due to his brother John exclusively.

The solemn grandeur of church art in the 15th century never found, out of Italy, a nobler exponent than Hubert van Eyck. His representation of Christ as the judge, between the Virgin and St. John, affords a fine display of realistic truth, combined with pure drawing, gorgeous colour, and a happy union of earnestness and simplicity with the deepest religious feeling. It is finished with great skill, and executed with the new oil medium, of which Hubert shared the invention with his brother, but of which no rival artists at the time possessed the secret—a medium which consists of subtle mixtures of oil and varnish applied to the moistening of pigments, after a fashion kept secret only for a time from gildsmen of neighbouring cities, but unrevealed to the Italians till near the close of the 15th century. When Hubert died on Sept. 18, 1426 he was buried in the chapel on the altar of which his masterpiece was placed. According to a tradition as old as the 16th century, his arm was preserved as a relic in a casket above the portal of St. Bavon of Ghent.

2. **JOHN (Jan) VAN EYCK** (?1385–1441). The date of his birth is not more accurately known than that of his elder brother, but he was born much later than Hubert, who took charge of him and made him his "disciple." Under this tuition John learnt to draw and paint, and mastered the properties of colours from Pliny. Later on, Hubert admitted him into partnership, and both were made court painters to Philip of Charolais. After the breaking up of the prince's household in 1421 John became his own master, left the workshop of Hubert and took an engagement as painter to John of Bavaria, at that time resident at The Hague as count of Holland. From The Hague he returned in 1424 to take

¹The whole of this altarpiece was reunited after the peace of Versailles, which provided for the restoration of the panels which had hitherto been in the Berlin Museum.

service with Philip, now duke of Burgundy, at a salary of 100 livres per annum, and from that time till his death John van Eyck remained his servant. He was frequently employed in missions of trust; and appears for a time to have been in ceaseless motion, receiving extra pay for secret services at Leyden, drawing his salary at Bruges, yet settled in a fixed abode at Lille. In 1428 he joined the embassy sent by Philip the Good to Lisbon to beg the hand of Isabella of Portugal. His portrait of the bride fixed the duke's choice. After his return he settled definitely at Bruges, where he married. His wife bore him a daughter, known in after years as a nun in the convent of Maeseyck. At the christening the duke was sponsor. Numerous altarpieces and portraits now give proof of Van Eyck's extensive practice. As works of art and models of conscientious labour they are all worthy of the name they bear, though not of equal excellence, none being better than those which were completed about 1432. Of an earlier period, a "Consecration of Thomas à Becket" has been preserved, and may now be seen at Chatsworth, bearing the date of 1421; no doubt this picture would give a fair representation of Van Eyck's talents at the moment when he started as an independent master, but that time and accidents of omission and commission have altered its state to such an extent that no conclusive opinion can be formed respecting it. The panels of the "Worship of the Lamb" were completed nine years later. They show that John van Eyck was quite able to work in the spirit of his brother, and John continued the work with almost as much vigour as his master. His own experience had been increased by travel, and he had seen the finest varieties of landscape in Portugal and the Spanish provinces. This enabled him to transfer to his pictures the scenery of lands more sunny than those of Flanders. We may ascribe much of the success which attended his efforts to complete the altar-piece of Ghent to the cleverness with which he reproduced the varied aspect of changing scenery, reminiscent here of the orange groves of Cintra, there of the bluffs and crags of his native valley. In all these backgrounds, though we miss the scientific rules of perspective with which the Van Eycks were not familiar, we find such delicate perceptions of gradations in tone, such atmosphere, yet such minuteness and perfection of finish that our admiration never flags. Nor is the colour less brilliant or the touch less firm than in Hubert's panels. John differs only from his brother in being less masculine and less sternly religious. He excels in two splendid likenesses of Jodocus Vijds and his wife Catherine Burluuts. The same vigorous style and coloured key of harmony characterizes the small "Virgin and Child" of 1433 at the National Gallery, Melbourne, Australia, formerly at Ince, and the "Madonna," probably of the same date, at the Louvre, Paris, executed for Rollin, chancellor of Burgundy. Contemporary with these, the male portraits in the National Gallery, and the "Man with the Pinks," in the Berlin Museum (1432-1434), show no relaxation of power; but later creations display no further progress, unless we accept as progress a more searching delicacy of finish, counterbalanced by an excessive softness of rounding in flesh contours. An unfaltering minuteness of hand and great tenderness of treatment may be found, combined with angularity of drapery and some awkwardness of attitude in the full length portrait couple (John Arnolfini and his wife [1434]), at the National Gallery, in which a rare insight into the detail of animal nature is revealed in a study of a terrier dog. A "Madonna with Saints," at Dresden, equally soft and minute, charms us by the mastery with which an architectural background is put in. The bold and energetic striving of earlier days, the strong bright tone, are not equalled by the soft blending and tender tints of the later ones. Sometimes a crude ruddiness in flesh strikes us as a growing defect, an instance of which is the picture in the museum of Bruges, in which Canon van der Paelen is represented kneeling before the Virgin under the protection of St. George (1434). From first to last Van Eyck retains his ability in portraiture. Fine specimens are the two male likenesses in the gallery of Vienna (1436), and a female, the master's wife, in the gallery of Bruges (1439). His death in 1441 at Bruges is authentically recorded. He was buried in St. Donat. Hubert's disciple, Jodocus of Ghent, hardly honours his master's teaching, and only acquires importance

after he has thrown off some of the peculiarities of Flemish teaching. Petrus Christus, who was taught by John, remains immeasurably behind him in everything that relates to art. But if the personal influence of the Van Eycks was small, that of their works was immense, and it is not too much to say that their example, taken in conjunction with that of Van der Weyden, determined the current and practice of painting throughout the whole of Europe north of the Alps for nearly a century. (J. A. C.)

The following pictures, besides those mentioned above, are generally attributed to the Van Eycks:—

"St. Barbara," signed and dated 1437, "The Virgin by a Fountain," signed and dated 1439, both in the museum at Antwerp; the "Annunciation" in the Hermitage at Leningrad; these pictures are ascribed to Jan. The following works of an earlier date are generally ascribed to Hubert, though some critics believe them to be by Jan: "The Crucifixion" and the "Last Judgment," two wings of an altarpiece in the Hermitage at Leningrad; the "Three Marias at the Sepulchre" in the Cook collection at Richmond; the "Virgin" in the nave of a Gothic church, at Berlin; two pictures of St. Francis, one in the Johnson collection at Philadelphia, the other in the museum at Turin. An attempt to distinguish between the styles of the two brothers has recently been made by Hulin, who attributes certain illuminations which were executed for Duke William of Holland, and which can therefore be dated, 1417, to the Van Eycks. See G. de Loo (Hulin) *Heures de Milan* (1911) and P. Durrieu, *Heures de Turin* (1902).

EYE, a market-town and municipal borough in the Eye parliamentary division of East Suffolk, England, 94½ m. N.E. from London on a branch from Mellis of the L.N.E.R. (Ipswich-Norwich section). Pop. (1931) 1,733. The church of St. Peter and St. Paul of Perpendicular flint work, with Early English portions and a fine 15th century rood screen, was formerly attached to a Benedictine priory. Fragments of a Norman castle crown a mound of probably earlier construction. There are a town hall, corn exchange and ancient grammar school. Brewing is the chief industry. The town is governed by a mayor, four aldermen and 12 councillors, and has a separate commission of the peace.

Eye (*Heya, Aye*) was once surrounded by a stream, from which it is said to have derived its name. Leland says it was situated in a marsh and had formerly been accessible by river vessels from Cromer. From the discovery of numerous remains, it has been thought that the place was once the cemetery of a Roman camp. William I. gave the lordship to Robert Malet, a Norman, who built a castle and a Benedictine monastery which was at first subordinate to the abbey of Bernay in Normandy. Eye is a borough by prescription. In 1205 King John granted to the townsmen a charter freeing them from various tolls and customs and from the jurisdiction of the shire and hundred courts. Later charters were granted by Elizabeth, James I. and William III. Two members were returned to parliament from 1571 till 1832, when the membership was reduced to one; in 1885 the representation was merged in the Eye division of the county. The making of pillow-lace was formerly carried on extensively.

EYE, ANATOMY OF. The eye consists of the eyeball, certain muscles which move it, and the lachrymal apparatus which keeps the front of it moist. The *eyeball* is contained in the front of the orbit and is a sphere of about an inch (24 mm.) in diameter. From the front of this a segment of a lesser sphere projects slightly and forms the *cornea* (see fig. 1). The eyeball has three coats, external (protective), middle (vascular), and internal (sensory). There are also three refracting media, the aqueous humour, the lens and the vitreous humour or body.

The protective coat consists of the *sclerotic* in the posterior five-sixths and the cornea in the anterior sixth. The sclerotic or "white of the eye" (see fig. 1) is a firm fibrous coat, posteriorly pierced by the optic nerve. The cornea is continuous with the

sclerotic but has a greater convexity. It consists of five layers, the outermost of which is stratified epithelium. Its transparency is due to the fact that all these layers have the same refractive index.

The middle or vascular coat of the eye consists of the *choroid*, the *ciliary processes* and the *iris*. The choroid (see fig. 1) does not come quite as far forward as the corneo-scleral junction; it is composed of numerous blood-vessels and pigment cells bound together by connective tissue.

The *ciliary processes* are some 70 triangular ridges, radially arranged, with their apices pointing backward (see fig. 1), while their bases are level with the corneo-scleral junction. They are as vascular as the rest of the choroid, and contain in their interior the *ciliary muscle*, which consists of radiating and circular fibres. The radiating fibres (see fig. 1) pull forward the choroid when they contract. The circular fibres lie just internal to these and are few or wanting in short-sighted people.

The *iris* (see fig. 1) is the coloured diaphragm of the eye, the centre of which is pierced to form the pupil; it is composed of a connective tissue stroma containing blood-vessels, pigment cells and muscle fibres. The pigment in the substance of the iris is variously coloured in different individuals, and is often deposited after birth, so that, in newly born European children, the colour

FIG. 1.—DIAGRAMMATIC SECTION THROUGH EYEBALL SHOWING CONSTITUENT PARTS

of the eyes is often slate-blue owing to the black pigment at the back of the iris showing through. White, yellow or reddish-brown pigment is deposited later in the substance of the iris, causing the appearance, with the black pigment behind, of grey, hazel or brown eyes. In blue-eyed people very little interstitial pigment is formed, while in Albinos the posterior pigment is also absent and the blood vessels give the pink coloration. The muscle fibres of the iris are circular and radiating, but it is uncertain whether the latter are really muscular or elastic.

The inner or sensory layer of the wall of the eyeball is the

retina; it is a delicate transparent membrane which becomes thinner as the front of the eye is approached. A short distance behind the ciliary processes the nervous part of it stops, and forms a scalloped border called the *ora serrata*. Under the microscope the posterior part of the retina is seen to consist, from front to back, of eight layers (fig. 2) as follows: (1) Layer of nerve fibres; (2) Layer of ganglion cells; (3) Inner molecular layer;

FIG. 2.—DIAGRAMMATIC SECTION THROUGH RETINA SHOWING LAYERS (1) Nerve fibres, (2) ganglion cells, (3) inner molecular layer, (4) inner nuclear layer, (5) outer molecular layer, (6) outer nuclear layer, (7) rods and cones, (8) pigmented layer

(4) Inner nuclear layer; (5) Outer molecular layer; (6) Outer nuclear layer; (7) Layer of rods and cones; (8) Pigmented layer. Supporting the delicate nervous structures of the retina and binding them together is a series of radial fibres, or connective tissue rods, known as the *fibres of Müller*.

When the retina is looked at with the naked eye from in front two small marks are seen on it. One of these is an oval depression about 3 mm. across, which, owing to the presence of pigment, is known as the yellow spot (*macula lutea*); it is situated directly in the antero-posterior axis of the eyeball, and at its margin the nerve fibre layer is thinned and the ganglionic layer thickened. At its centre, however, both these layers are wanting, and in the layer of rods and cones only the cones are present. This central part is called the *fovea centralis* and is the point of acutest vision. The second mark is a little below and to the inner side of the yellow spot; it is a circular disc with raised margins and a depressed centre and is called the *optic disc*; in structure it is a complete contrast to the yellow spot, for all the layers except that of the nerve fibres are wanting, and consequently, as light cannot be appreciated here, it is known as the "blind spot." It marks the point of entry of the optic nerve, and at its centre the retinal artery appears and divides into branches. An appreciation of the condition of the optic disc is one of the chief objects of the ophthalmoscope.

The *crystalline lens* (see fig. 1) with its ligaments separates the aqueous from the vitreous chamber of the eye; it is biconvex and the posterior surface is more curved than the anterior. Radiating from the anterior and posterior poles are three faint lines forming a Y, the posterior Y being erect and the anterior inverted. Running from these figures are lamellae, like the layers of an onion, each of which is made up of fibrils called the lens fibres. The whole lens is enclosed in an elastic structureless membrane, and, like the cornea, its transparency is due to the fact that all its constituents have the same refractive index.

The ligament of the lens is the thickened anterior part of the hyaloid membrane which surrounds the vitreous body; it is closely connected to the iris at the *ora serrata*, and then splits into two layers, of which the anterior is the thicker and blends with the anterior part of the elastic capsule of the lens, so that, when its attachment to the *ora serrata* is drawn forward by the ciliary muscle, the lens by its own elasticity, increases its convexity. Between the anterior and posterior splitting of the hyaloid membrane is a circular lymph space surrounding the margin of the lens known as the *canal of Petit*.

The *aqueous humour* (see fig. 1) is contained between the lens and its ligament posteriorly and the cornea anteriorly. It is practically a very weak solution of common salt (chloride of sodium 1.4%). The space containing it is unequally divided into a large anterior and a small posterior chamber by a perforated diaphragm

—the iris.

The *vitreous body* or *humour* is a jelly which fills all the contents of the eyeball behind the lens. It is surrounded by the hyaloid membrane, and anteriorly is concave for the reception of the lens. The composition of the vitreous is practically the same as that of the aqueous humour.

The *arteries of the eyeball* are derived from the ophthalmic branch of the internal carotid, and consist of the retinal which enters the optic nerve far back in the orbit, the two long ciliaries, which run forward in the choroid and join the anterior ciliaries to form a circle round the margin of the iris, and the six to twelve short ciliaries which pierce the sclerotic round the optic nerve and supply the choroid and ciliary processes.

The *veins of the eyeball* emerge as four or five trunks rather behind the equator and open into the superior ophthalmic vein. In addition there is a retinal vein which accompanies its artery.

Accessory Structures of the Eye.—The *eyelids* are composed of the following structures from in front backward: (1) Skin; (2) Superficial fascia; (3) Orbicularis palpebrarum muscle; (4) *Tarsal plates* of fibrous tissue; (5) *Meibomian glands*, which are large modified sebaceous glands lubricating the edges of the lids, and *Glands of Moll*, large sweat glands which, when inflamed, cause a "sty"; (6) the *conjunctiva*, a layer of mucous membrane which lines the back of the eyelids and is reflected on to the front of the globe, on the front of the cornea the conjunctiva is continuous with the layer of epithelial cells already mentioned.

The *lacrimal gland* is found in the upper and outer part of the front of the orbit and is about the size of an almond. Its six to twelve ducts open on to the upper reflection of the conjunctiva.

The *lacrimal canals* (canaliculi) (indicated in fig. 3) are superior and inferior, and open by minute orifices (puncta) on to the free margins of the two eyelids near their inner point of junction. They collect the tears, secreted by the lacrimal gland, which thus pass right across the front of the eyeball, continually

FROM JULER, "HANDBOOK OF OPHTHALMIC SCIENCE AND PRACTICE" (MURRY)

FIG. 3.—DISSECTION OF LACRYMAL APPARATUS SHOWING LACRYMAL DUCTS, LACRYMAL SAC AND NASAL DUCT

moistening the conjunctiva. The two ducts are bent round a small pink tubercle (*caruncula lacrymalis*) (see fig. 3) at the inner angle of the eyelids, and open into the *lacrimal sac* (see fig. 3), which lies in a groove in the lacrimal bone. The sac is continued down into the *nasal duct* (see fig. 3), which is about $\frac{3}{4}$ in. long and opens into the inferior meatus of the nose, its opening being guarded by a valve.

The orbit contains seven muscles, six of which rise close to the optic foramen. The *levator palpebrae superioris* is the highest, and passes forward to the superior tarsal plate and fornix of the conjunctiva. The *superior* and *inferior recti* are inserted into the upper and lower surfaces of the eyeball respectively; they make the eye look inward as well as up or down. The external and internal recti are inserted into the sides of the eyeball and make it look outward or inward. The superior oblique runs forward to a pulley in the inner and front part of the roof of the orbit, round which it turns to be inserted into the outer and back part of the eyeball. It turns the glance downward and outward. The inferior oblique rises from the inner and front part of the floor of the

orbit, and is also inserted into the outer and back part of the eyeball. It directs the glance upward and outward. Of all these muscles the superior oblique is supplied by the fourth cranial nerve, the external rectus by the sixth and the rest by the third.

The posterior part of the eyeball and the anterior parts of the muscles are enveloped in a lymph space, known as the *capsule of Tenon*, which assists their movements.

Embryology.—The *optic vesicles* grow out from the fore-brain, and the part nearest the brain becomes constricted and

FIGS. 4 AND 5.—EMBRYOLOGY OF EYE. (LEFT) FIRST STAGE OF DEVELOPING EYE AND (RIGHT) SECOND STAGE OF THE SAME

elongated to form the optic stalk (see figs. 4 and 5). At the same time the ectoderm covering the side of the head thickens and becomes invaginated to form the lens vesicle (see figs. 4 and 5), which later loses its connection with the surface and approaches the optic vesicle, causing that structure to become cupped for its reception, so that what was the optic vesicle becomes the optic cup and consists of an external and an internal layer of cells (see fig. 6). Of these cells the outer ones become the retinal pigment, while the inner form the other layers of the retina. The invagination of the optic cup extends, as the *choroidal fissure* (not shown in the diagrams), along the lower and back part of the optic stalk, and into this slit sinks some of the surrounding mesoderm to form the vitreous body. When this has happened the fissure closes up. The anterior epithelium of the lens vesicle remains, but from the posterior the lens fibres are developed and these gradually fill up the cavity. The superficial layer of head ectoderm, from which the lens has been invaginated and separated, becomes the anterior epithelium of the cornea (fig. 6), and between it, and the lens the mesoderm sinks in to form the cornea, iris and anterior chamber of the eye, while surrounding the optic cup the mesoderm forms the sclerotic and choroid coats (indicated in fig. 7). Up to the seventh month the pupil is closed by the *membrana pupillaris*, derived from the capsule of the lens which is part of the mesodermal ingrowth through the choroidal fissure already mentioned. Most of the

FIGS. 6 AND 7.—EMBRYOLOGY OF THE EYE. (LEFT) THIRD STAGE OF THE DEVELOPING EYE AND (RIGHT) FOURTH STAGE

fibres of the optic nerve are centripetal and begin as the axons of the ganglionic cells of the retina; a few, however, are centrifugal and come from the nerve cells in the brain.

The eyelids are developed as ectodermal folds, which blend with one another about the third month and separate again before birth in man (see fig. 7). The lacrimal sac and duct are formed from solid ectodermal thickenings which later become canalized.

It will thus be seen that the optic nerve and retina are formed from the brain ectoderm; the lens, anterior epithelium of the cornea, skin of the eyelids, conjunctive and lacrimal apparatus

from the superficial ectoderm; while the sclerotic, choroid, vitreous and aqueous humours as well as the iris and cornea are derived from the mesoderm.

Comparative Anatomy.—The Acrania, as represented by *Amphioxus* (the lancelet), have a patch of pigment in the fore part of the brain which is regarded as the remains of a degenerated eye. In the Cyclostomata the hag (*Myxine*) and larval lamprey (*Ammocoetes*) have ill-developed eyes lying beneath the skin and devoid of lens, iris, cornea and sclerotic as well as eye muscles. In the adult lamprey (*Petromyzon*) these structures are developed at the metamorphosis, and the skin becomes transparent, rendering sight possible. Ocular muscles are developed, but, unlike most vertebrates, the inferior rectus is supplied by the sixth nerve while all the others are supplied by the third. In all vertebrates the retina consists of a layer of senso-neural cells, the rods and cones, separated from the light by the other layers which together represent the optic ganglia of the invertebrates; in the latter animals, however, the senso-neural cells are nearer the light than the ganglia.

In fishes the eyeball is flattened in front, but the flat cornea is compensated by a spherical lens, which, unlike that of other vertebrates, is adapted for near vision when at rest. The iris in some bony fishes (Teleostei) is not contractile. In the Teleostei, too, there is a process of the choroid (*processus falciformis*) which projects into the vitreous chamber and runs forward to the lens; besides nourishing the lens it is concerned in accommodation. This group of fishes is also remarkable for the possession of a so-called *choroid gland*, which is really an arterial network between the choroid and sclerotic. The sclerotic in fishes is usually chondrified and sometimes calcified or ossified. In the retina the rods and cones are about equal in number, and the cones are very large. In the cartilaginous fishes (Elasmobranchs) there is a silvery layer (*tapetum lucidum*), on the retinal surface of the choroid.

In the Amphibia the cornea is more convex than in the fish, but the lens is circular and the sclerotic often chondrified. The class shows the first rudiments of the ciliary muscle, although accommodation is brought about by shifting the lens. In the retina the rods outnumber the cones. The latter are smaller than in other animals.

In Reptilia the eye is spherical and its anterior part is often protected by bony plates in the sclerotic (Lacertilia and Chelonina). The ciliary muscle is striated, and in most reptiles accommodation is effected by relaxing the ciliary ligament as in higher vertebrates, though in the snakes (*Ophidia*) the lens is shifted as it is in the lower forms. Many lizards have a vascular projection of the choroid into the vitreous, foreshadowing the pecten of birds and homologous with the *processus falciformis* of fishes. In the retina the rods are scarce or absent.

In birds the eye is tubular, especially in nocturnal and rapacious forms; this is due to a lengthening of the ciliary region, which is always protected by bony plates in the sclerotic. The pecten, already mentioned in lizards, is a pleated vascular projection from the optic disc towards the lens which in some cases it reaches. In *Apteryx* this structure disappears. In the retina cones outnumber rods, but are not as numerous as in reptiles.

In the Mammalia the eye is largely enclosed in the orbit, and bony plates in the sclerotic are only found in the monotremes. The cornea is convex except in aquatic mammals, in which it is flattened. The lens is biconvex in diurnal mammals, but in nocturnal and aquatic it is spherical. There is no pecten, but the numerous hyaloid arteries which are found in the embryo represent it. The iris usually has a circular pupil, but in some ungulates and kangaroos it is a transverse slit. In the Cetacea this transverse opening is kidney-shaped, the hilum of the kidney being above. In many carnivores, especially nocturnal ones, the slit is vertical, and this form of opening seems adapted to a feeble light, for it is found in the owl, among birds. The *tapetum lucidum* is found in Ungulata, Cetacea and Carnivora. The ciliary muscle is unstriped. In the retina the rods are more numerous than the cones, while the macula lutea only appears in the Primates in connection with binocular vision.

Among the accessory structures of the eye the retractor bulbi muscle is found in amphibians, reptiles, birds and many mammals; its nerve supply shows that it is probably a derivative of the external or posterior rectus. The nictitating membrane or third eyelid is well developed in amphibians, reptiles, birds and some few sharks; it is less marked in mammals, and in man is only represented by the little *plica semilunaris*. When functional it is drawn across the eye by special muscles derived from the retractor bulbi. In connection with the nictitating membrane the Harderian gland is developed, while the lachrymal gland secretes fluid for the other eyelids to spread over the conjunctiva. These two glands are specialized parts of a row of glands which in the Urodela (tailed amphibians) are situated along the lower eyelid; the outer or posterior part of this row becomes the lachrymal gland, which in higher vertebrates shifts from the lower to the upper eyelid, while the inner or anterior part becomes the Harderian gland. Below the amphibians glands are not necessary, as the water keeps the eye moist.

The lachrymal duct first appears in the tailed amphibians; in snakes and gecko lizards, however, it opens into the mouth.

BIBLIOGRAPHY.—For further details see any standard text-book of anatomy. Later literature is noticed in the catalogue of the Museum of the Royal College of Surgeons (London). (F. G. P.)

EYE, DISEASES OF. The specially important diseases of the eye are those which temporarily or permanently interfere with sight. (See BLINDNESS, CAUSES OF.) In considering the subject it must be remembered that (1) the eye is a double organ, while (2) either eye may have its own trouble.

1. Normally, the two eyes act together. Impressions made upon either retina, to the one side of a vertical line through the centre, the *fovea centralis*, before giving rise to conscious perception cause a stimulation of the same area in the brain. Impressions formed simultaneously, for instance, on the right side of the right retina and on corresponding areas of the right side of the left retina, are conveyed to the same spots in the right occipital lobe of the brain. Pathological processes, therefore, which are localized in the right or left occipital lobes, or along any part of the course of the fibres which pass from the right or left optic tracts to these "visual centres," cause defects in function of the right or left halves of the two retinæ. *Hemianopia*, or half-blindness, arising from these pathological changes, is of very varying degrees of severity, according to the nature and extent of the particular lesion. The blind areas in the two fields of vision, corresponding to the outward projection of the paralysed retinal areas, are always symmetrical both in shape and degree. The central lesion may for instance be very small, but at the same time destructive to the nerve tissue. This will be revealed as a sector-shaped or insular symmetrical complete blindness in the fields of vision to the opposite side. Or a large central area, or an area comprising many or all of the nerve fibres which pass to the visual centre on one side, may be involved in a lesion which causes impairment of function, but no actual destruction of the nerve tissue. There is thus caused a symmetrical weakening of vision (*amblyopia*) in the opposite fields. In such cases the colour vision is so much more evidently affected than the sense of form that the condition has been called *hemiachromatopsia* or half-colour blindness. *Hemianopia* may be caused by hæmorrhage, embolism, or tumour growth which either directly involves the visual nerve elements or affects them by compression and by inflammation. Transitory hemianopia is rare and is frequently of toxic origin.

The two eyes also act as if they were one in accommodating. It is impossible for the two eyes to accommodate simultaneously to different extents, so that where there is, as occasionally happens, a difference in focus between them, this difference remains the same for all distances for which they are adapted. In such cases, therefore, both eyes cannot ever be accurately adapted at the same time, though either may be alone. It often happens as a consequence that the one eye is used to receive the sharpest images of distant, and the other of near objects. Any pathological change which leads to an interference in the accommodating power of one eye alone must have its origin in a lesion which lies peripherally to the nucleus of the third cranial nerve. Such a

lesion is usually one of the third nerve itself. Consequently, a unilateral accommodation paresis is almost invariably associated with paresis of some of the oculo-motor muscles. A bilateral accommodation paresis is not uncommon. It is due to a nuclear or more central cerebral disturbance. Unlike a hemianopia, which is mostly permanent, a double accommodation paresis is frequently transitory. It is often a post-diphtheritic condition, appearing alone or associated with other paresis.

Both eyes are also, normally, associated in their movements. They move in response to a stimulus or a combination of stimuli, emanating from different centres of the brain, but always equally distributed to the corresponding muscles in both eyes, so that the two lines of fixation meet at the succession of points on which attention is directed. The movements are thus associated in the same direction, to the right or left, upwards or downwards, etc. In addition, owing to the space which separates the two eyes, convergent movements, caused by stimuli equally distributed between the two internal recti, are required for the fixation of nearer and nearer-lying objects. These movements would not be necessary in the case of a single eye. It would merely have to accommodate. The converging movements of the double eye occur in association with accommodation, and thus a close connection becomes established between the stimuli to accommodation and convergence. All combinations of convergent and associated movements are constantly taking place normally.

Associated and convergent movements may be interfered with pathologically in different ways. Cerebral lesions may lead to their impairment or complete abolition, or they may give rise to involuntary spasmodic action, as the result of paralyzing or irritating the centres from which the various co-ordinated impulses are controlled or emanate. Lesions which do not involve the centres may prevent the response to associated impulses in one eye alone by interfering with the functional activity of one or more of the nerves along which the stimuli are conveyed. Paralysis of oculo-motor nerves is thus a common cause of defects of association in the movements of the double eye. The great advantage of simultaneous binocular vision—viz., the appreciation of depth, or stereoscopic vision—is thus lost for some, or it may be all, directions of fixation. Instead of seeing singly with two eyes, there is then double-vision (*diplopia*). This persists so long as the defect of association continues, or so long as the habit of mentally suppressing the image of the faultily-directed eye is not acquired.

In the absence of any nerve lesions, central or other, interfering with their associated movements the eyes continue throughout life to respond equally to the stimuli which cause these movements, even when, owing to a visual defect of the one eye, binocular vision has become impossible. It is otherwise, however, with the proper co-ordination of convergent movements. These are primarily regulated by the unconscious desire for binocular vision, and more or less firmly associated with accommodation. When one eye becomes blind, or when binocular vision for other reasons is lost, the impulse is gradually, as it were, unlearned. This is the cause of *divergent concomitant squint*. Under somewhat similar conditions a degree of convergence, which is in excess of the requirements of fixation, may be acquired from different causes. This gives rise to *convergent concomitant squint*.

For *Astigmatism*, etc., see the article *Vision*.

2. Taking each eye as a single organ, we find it to be subject to many diseases. In some cases both eyes are affected in the same way, e.g., where the local disease is a manifestation of some general disturbance. Apart from the fibrous coat of the eye, the sclera, which is little prone to disease, and the external muscles and other adnexa, the eye may be looked upon as composed of two elements: (a) the dioptric media, and (b) the parts more or less directly connected with perception.

The dioptric media, or the transparent portions which are concerned in the transmission of light to, and the formation of images upon, the retina, are the following: the *cornea*, the *aqueous humour*, the *crystalline lens* and the *vitreous humour*. Loss of transparency in any of these media leads to blurring of the retinal images of external objects. In addition to loss of trans-

parency the cornea may have its curvature altered by pathological processes. This necessarily causes imperfection of sight. The crystalline lens, on the other hand, may be dislocated, and thus cause image distortion.

The Cornea.—The transparency of the cornea is mainly lost from inflammation (*keratitis*). This causes an infiltration of its tissues with leucocytes, or a focal, destructive ulcerative process.

Inflammation of the cornea may be primary or secondary, i.e., the inflammatory changes may be directly connected with one or more foci of inflammation in the cornea itself or the focus or foci may be in some other part of the eye. Only the very superficial forms of primary keratitis, those confined to the epithelial layer, leave no permanent change; there is otherwise always a loss of tissue resulting from the inflammation and this loss is made up for by more or less densely intransparent connective tissue (*nebula*, *leucoma*). These according to their site and extent cause greater or less visual disturbance. Primary keratitis may be ulcerative or non-ulcerative, superficial or deep, diffuse or circumscribed, vascularized or non-vascularized. It may be complicated by deeper inflammations of the eye such as iritis and cyclitis. In some cases the anterior chamber is invaded by pus (*hypopyon*). The healing of a corneal ulcer is characterized by the disappearance of pain where this has been a symptom and by the rounding off of its sharp margins as epithelium spreads over them from the surrounding healthy parts. Ulcers tend to extend either in depth or superficially, rarely in both manners at the same time. A deep ulcer leads to perforation with more or less serious consequences according to the extent of the perforation. Often an eye bears permanent traces of a perforation in adhesion of the iris to the back of a corneal scar or in changes in the lens capsule (capsular cataract). In other cases the ulcerated cornea may yield to pressure from within, which causes it to bulge forwards (*staphyloma*).

The principal causes of primary keratitis are injuries and infection from the conjunctiva. Injuries are most serious when the body causing the wound is septic or when micro-organisms from some other source, often the conjunctiva and tear-sac, effect a lodgement before healing of the wound has sufficiently advanced. In infected cases a complication with iritis is not uncommon owing to the penetration of toxins into the anterior chamber.

Primary Keratitis.—Inflammations of the cornea are the most important diseases of the eye. Treatment of primary keratitis must vary according to the cause. Generally speaking the aim should be to render the ulcerated portions as aseptic as possible without using applications which are apt to cause a great deal of irritation and thus interfere with healing. On this account it is important to be able to recognize when healing is taking place, for then rest, and frequent irrigation of the conjunctiva with sterilized water at the body temperature, and occasional mild antiseptic irrigation of the nasal mucous membrane is all that is required. It is dangerous to overtreat.

Among the many local antiseptics may be mentioned the actual cautery, chlorine water, freshly prepared silver nitrate or protargol, and the yellow oxide of mercury. These agents are not equally applicable in any given case. For instance, the actual cautery is employed only in the case of the deeper septic ulcers, in which the destruction of tissue is already considerable and tending to spread further. Again the yellow oxide of mercury should only be used in the more superficial, tuberculous forms of inflammation.

Secondary Keratitis takes the form of an interstitial deposit of leucocytes between the layers of the cornea as well as often of vascularization, sometimes intense, from the deeper network of vessels (anterior ciliary) surrounding the cornea. The duration of a secondary keratitis often lasts many months. More or less complete restoration of transparency is the rule, however, eventually.

No local treatment is called for except shading of the eyes and in most cases use of a mydriatic to prevent adhesions when the iris is involved. Inherited syphilis, tuberculous and other inflammations are the causes of secondary keratitis.

Neuro-paralytic Keratitis.—When the fifth nerve (sensory) is paralysed there is a tendency for the cornea to become inflamed. Different forms of inflammation may then occur which all show a marked slowness in healing. The explanation of neuro-paralytic keratitis is that in the insensitised condition of the cornea it is less guarded against injuries. The prognosis is necessarily bad. The treatment consists in as far as possible protecting the eye from external influences and frequently irrigating with antiseptic lotions.

Certain degenerative changes occur in the cornea. In *keratoconus* or conical cornea, the normal curvature of the cornea becomes altered with consequent impairment of vision. Other degenerative changes are *arcus senilis*, a whitish opacity due to fatty degeneration, extending round the corneal margin, varying in thickness in different subjects and usually only met with in old people: *transverse calcareous film*, consisting of a finely punctiform opacity extending, in a tolerably uniformly wide band, occupying the zone of the cornea which is left uncovered when the lids are half closed.

Scleritis.—Inflammation of the sclera is confined to its anterior part which is covered by conjunctiva. Scleritis may occur in circumscribed patches or in the shape of a belt round the cornea. The former is usually more superficial and uncomplicated, the latter deeper and complicated with corneal infiltration, iridocyclitis and anterior choroiditis. Superficial scleritis (*episcleritis*) is a long-continued disease which is associated with very varying degrees of discomfort. Its chronic nature depends mainly upon the tendency that the inflammation has to recur in successive patches at different parts of the sclera. Often only one eye at a time is affected. Each patch lasts for a month or two and is succeeded by another after an interval of varying duration. Months or years may elapse between the attacks. The cicatricial site of a previous patch is rarely again attacked. The scleral infiltration causes a firm swelling, often sensitive to touch, over which the conjunctiva is freely moveable. The overlying conjunctiva is always injected. The infiltration itself at the height of the process is densely vascularized. Seen through the conjunctiva its vessels have a darker, more purplish hue than the superficial ones. The swelling caused by the infiltration gradually subsides, leaving a cicatrix to which the overlying conjunctiva becomes adherent. The cicatrix has a slaty, porcellaneous-looking colour. Superficial scleritis occurs in both sexes with about equal frequency. No definite cause for the inflammation is known.

Deep scleritis with its attendant complications is a more serious disease. Etiologically it is equally obscure. Both eyes are almost always attacked. It more generally occurs in young people, mostly in young women. It is more persistent and less subject to periods of intermission than episcleritis. Eventually it leads to weakening of the sclerotic coat causing it to yield to the intraocular pressure. Vision suffers from extension of the infiltration to the cornea, or from iritis with its attendant adhesions, or from anterior choroiditis, and sometimes also from secondary glaucoma. Iridectomy, especially if done early in the process, may be of use.

The Aqueous Humour.—Intransparency of the aqueous humour is always due to some exudation. This comes either from the iris or the ciliary processes, and may be blood, pus or fibrin. An exudation in this situation tends naturally to gravitate to the most dependent part, and, in the case of blood or pus, is known as *hyphaema* or *hypopyon*.

The Crystalline Lens Cataract.—Intransparency of the crystalline lens is technically known as *cataract*. Cataract may be idiopathic and uncomplicated, or traumatic, or secondary to disease in the deeper parts of the eye. The modified epithelial structure of which the lens is composed is always being added to throughout life. The older portions of the lens are consequently the more central. They are harder and less elastic. This arrangement seems to predispose to difficulties of nutrition. In many people, in the absence altogether of general or local disease, the transparency of the lens is lost owing to degeneration of the incompletely-nourished fibres. This idiopathic cataract mostly occurs in old people; hence the term *senile cataract*. So-called *senile* cataract is not, however, necessarily associated with any

general senile changes. An idiopathic uncomplicated cataract is also met with as a congenital defect due to faulty development of the crystalline lens. A particular and not uncommon form of this kind of cataract, which may also develop during infancy, is *lamellar* or *zonular cataract*. This is a partial and stationary form of cataract in which, while the greater part of the lens retains its transparency, some of the lamellae are intrinsically opaque. Traumatic cataract occurs in two ways: by laceration or rupture of the lens capsule, or by nutritional changes consequent upon injuries to the deeper structures of the eye. The transparency of the lens is dependent upon the integrity of its capsule. Penetrating wounds of the eye involving the capsule, or rupture of the capsule from severe blows on the eye without perforation of its coats, are followed by rapidly developing cataract. Severe non-penetrating injuries, which do not cause rupture of the capsule, are sometimes followed, after a time, by slowly-progressing cataract. Secondary cataract is due to abnormalities in the nutrient matter supplied to the lens owing to disease of the ciliary body, choroid or retina. In some diseases, as diabetes, the altered general nutrition tells in the same way on the crystalline lens. Cataract is then rapidly formed. All cases of cataract in diabetes are not, however, necessarily true diabetic cataracts in the above sense. *Dislocations of the lens* are traumatic or congenital. In old-standing disease of the eye the suspensory ligament may yield in part, and thus lead to lens dislocation. The lens is practically always cataractous before this takes place.

The Vitreous Humour.—The vitreous humour loses its transparency owing to exudation from the inflamed ciliary body or choroid. The exudation may be fibrinous or purulent; the latter only as a result of injuries by which foreign bodies or septic matter are introduced into the eye or in metastatic choroiditis. Blood may also be effused into the vitreous from rupture of retinal, ciliary or choroidal vessels. The pathological significance of the various effusions into the vitreous depends greatly upon the cause. In many cases effusion and absorption are constantly taking place simultaneously. Whether clearing occurs depends on whether absorption preponderates.

Diseases of the Iris and Ciliary Body.—Inflammation of the iris, *iritis*, arises from different causes. Some forms have relations with rheumatism, gout, albuminuria, tuberculosis, fevers, syphilis, gonorrhoea. Traumatic and infected cases are attributable to accidents, the presence of foreign bodies, operations, etc. In addition, iritis may be secondary to keratitis, scleritis or choroiditis. The beginning of an attack of inflammation of the iris is characterized by alterations in its colour due to hyperaemia and by circumcorneal injection. Later on, exudation takes place into the substance of the iris, causing thickening and also a loss of gloss to its surface. According to the nature and severity of the exudation there may be deposits formed on the back of the cornea, adhesions between the iris and lens capsule (*synechiae*), or even gelatinous-looking coagulations or pus in the anterior chamber.

The symptoms to which the inflammation may give rise are dread of light (*photophobia*), pain, generally most severe at night and often very great, lacrimation, more or less impairment of sight. An acute attack of iritis usually lasts about six weeks. Some cases become chronic and last much longer. Others are chronic from the first, and in one clinical type, in which the ciliary body is also affected, viz., *iritis serosa*, there is usually little injection of the eye or pain, so that the patient's attention may only be directed to the eye by gradual impairment of sight. In some cases, particularly in men, there is recurrence at longer or shorter intervals of attacks of iritis (*recurrent iritis*). In these cases, as well as in all cases of plastic iritis, serious consequences to sight are apt to follow from adhesion of the iris to the lens capsule and occlusion of the pupil by exudation.

Inflammation of the ciliary body, *cyclitis*, is frequently associated with iritis. This association is probable in all cases where there are deposits on the posterior surface of the cornea. It is certain where there are changes in the intra-ocular tension. Often in cyclitis there is a very marked diminution in tension. Cyclitis is also present when the degree of visual disturbance is greater than can be accounted for by the visible changes in the pupil and

anterior chamber. The exudation may, as in iritis, be serous, plastic or purulent. It passes from the two free surfaces of the ciliary body into the posterior aqueous, and into the vitreous, chambers. This produces more or less intransparency of the vitreous humour, a constant sign of cyclitis. Where there has been excessive exudation into the vitreous, subsequent shrinking and liquefaction take place, leading to detachment of the retina and consequent blindness. The most serious form of iridocyclitis is that which may follow penetrating wounds of the eye. This may lead to a similar inflammation of the other eye (*sympathetic ophthalmia*) which ends in its complete destruction.

The treatment of iritis necessarily differs to some extent according to the cause. The general treatment applicable to all cases need only be here considered. The aim should be to put the eye as far as possible at rest, to prevent the formation of adhesions and alleviate the pain. An attempt should be made to keep the pupil thoroughly dilated with atropine as long as any circumcorneal injection lasts. If a case of iritis be left to itself or treated without the use of a mydriatic, posterior synechiae almost invariably form. Some fibrinous exudation may even organize into a membrane stretching across, and more or less completely occluding, the pupil. Synechiae, though not of themselves causing impairment of vision, increase the risk that the eye runs from subsequent attacks of iritis. It should, however, be remembered that as the main call for a mydriatic is to prevent synechiae, the *raison d'être* for its use no longer exists when, having been begun too late, the pupil cannot properly be dilated by it. Under these conditions it may even do harm. The eyes should also be kept shaded from the light by the use of a shade or neutral-tinted glasses. During an attack any use of the eyes for reading, sewing or work of any kind calling for accommodation must be prohibited. This applies equally to the case of inflammation in one eye alone and in both.

Pain is best relieved by hot fomentations, cocaine, and in many cases the internal use of salicin or phenacetin. The treatment sometimes required for cases of old iritis is iridectomy. The operation is called for in two different classes of cases. In the first place, to improve vision where the pupil is small, and to a great extent occluded, though the condition has not so far led to serious nutritive changes; and in the second place, with the object of preventing the complete destruction of vision threatened by either the existing condition or the danger of recurrence of the inflammation. Iridectomy for iritis should be performed when the inflammation has entirely subsided. The portion of iris excised should be large. The operation is urgently called for where the condition of *iris bombans* exists.

Iris tumours, either simple or malignant, are rare. A frequent result of a severe blow on the eye is a separation of a portion of the iris from its peripheral attachment. Of congenital anomalies the most common are a cleft condition (*coloboma*) and more or less persistence of the foetal pupillary membrane.

The Retina.—Choroidal inflammations are generally patchy. These patches may in course of time become more or less confluent. The effect upon vision depends upon the extent to which the external or percipient elements of the retina become involved. It is especially serious when the more central portions of the retina are thus affected.

In *glaucoma* there is an increase of intra-ocular tension, which acts injuriously on the optic nerve end and its ramifications in the retina. The cause of the rise of tension is partly congestive, partly mechanical. The effect of glaucoma, when untreated, is to cause ever-increasing loss of sight, although the time occupied by the process before it leads to complete blindness varies within such extraordinary wide limits as from a few hours to many years. The onset of glaucoma is characterized by subjective flashes of light or a halo around objects and stony hardness of the eyeball to touch. Such symptoms call for immediate treatment, instillation of pilocarpine to contract the pupil to the utmost and thus dilate the lymphatic canal of Petit (*see EYE, ANATOMY OF*) or iridectomy. The uveal tract may be the site of *sarcoma*.

The retina is subject to inflammation, to detachment from the choroid, to haemorrhages from the blood-vessels and to tumour.

Retinal inflammation may primarily affect either the nerve elements or the connective tissue framework. The former is usually associated with some general disease such as albuminuria or diabetes and is bilateral. The tissue changes are oedema, the formation of exudative patches, and haemorrhage. Where the connective tissue elements are primarily affected, the condition is a slow one, similar to *sclerosis* of the central nervous system. The gradual blindness which this causes is due to compression of the retinal nerve elements by the connective tissue hyperplasia, which is always associated with characteristic changes in the disposition of the retinal pigment. This retinal sclerosis is generally known as *retinitis pigmentosa*, a disease with hereditary predisposition. Haemorrhages into the retina are met with in phlebitis of the central retinal vein, which is almost invariably unilateral, and in certain conditions of the blood, as pernicious anaemia, when they are always bilateral.

The optic nerve is subject to inflammation (optic neuritis) and atrophy. Double optic neuritis, affecting, however, only the intra-ocular ends of the nerves, is an almost constant accompaniment of brain tumour. Unilateral neuritis has a different causation, depending upon an inflammation, mainly perineuritic, of the nerve in the orbit. It is analogous to peripheral inflammation of other nerves, such as the third, fourth, sixth and seventh cranial nerves.

Diseases of the Conjunctiva.—These are the most frequent diseases of the eye with which the surgeon has to deal. They generally lead to some interference with vision and to great impairment if the cornea is implicated.

Hyperaemia.—When the conjunctiva becomes hyperaemic its colour is heightened and its transparency lessened. Sometimes it becomes thickened, and in long standing cases velvety. The redness is most marked in the fold between the palpebral and the ocular conjunctiva, and diminishes towards the cornea. An important diagnostic mark is thus furnished between purely conjunctival hyperaemia and circumcorneal congestion, which is always an indication of more deep-seated vascular dilatation. It also differs materially from a scleral injection, in which there is a visible dilatation of the superficial scleral vessels.

Hyperaemia of the conjunctiva where not followed by inflammation causes more or less lacrimation but no alteration in the character of its secretion. The hyperaemia may be acute and transitory or chronic. Much depends upon the cause as well as upon the persistence of the irritation which sets it up.

Traumata, the presence of foreign bodies in the conjunctival sac, or the irritations of superficial chalky infarcts in the Meibomian ducts, cause more or less severe transitory congestion. Continued subjection to irritating particles of dust, etc., causes a more continued hyperaemia, often circumscribed and less pronounced. Bad air also causes a chronic hyperaemia in which it is common to find a follicular hyperplasia. Long exposure to too intense light, astigmatism and other ocular defects which cause asthenopia lead also to chronic hyperaemia. Anaemic individuals often suffer from hyperaemia of this nature.

The treatment of conjunctival hyperaemia consists first in the removal of the cause when it can be discovered. Often this is difficult. The application of hot sterilized water is useful.

Conjunctivitis.—When the conjunctiva is actually inflamed its secretion becomes copious and altered in character. A practical though by no means sharply defined clinical division of cases of conjunctivitis is afforded by the character of the secretion from the inflamed membrane and the visible tissue alterations which the membrane undergoes. The common varieties of conjunctivitis which may thus be distinguished are (a) Catarrhal conjunctivitis, (b) Purulent conjunctivitis, (c) Phlyctenular conjunctivitis, (d) Granular conjunctivitis, and (e) Diphtheritic conjunctivitis.

The treatment should have the primary object of preventing implication of the cornea and extension to the other eye.

Catarrhal conjunctivitis, which is characterized by an increased mucoid secretion accompanying the hyperaemia, is usually bilateral and may be either acute or chronic. Acute conjunctivitis lasts as a rule only for a week or two: the chronic type may persist, with or without exacerbations, for years. The subjective symptoms vary in intensity with the severity of the inflammation.

There is always troublesome "burning" in the eyes with a tired, heavy feeling in the lids. This is aggravated by reading. In acute cases, indeed, reading is impossible. In all cases the symptoms are also more marked if the eyes have been tied up, though this may produce a temporary relief.

A special variety of acute catarrhal conjunctivitis is the so-called *hay-fever* (q.v.; see *ANAPHYLAXIS*). Other ectogenetic causes are mostly microbic. The most common are the Morax-Axenfeld and the Koch-Weeks conjunctivitis.

The Morax-Axenfeld bacillus sets up a contagious conjunctivitis which affects individuals of all ages and conditions. The inflammation is usually chronic, at most subacute. It is often sufficiently characteristic to be recognized without a microscopical examination of the secretions. In typical cases the lid margin, palpebral conjunctiva, and it may be a patch of ocular conjunctiva at the outer or inner angle are alone hyperaemic: the secretion is not copious and is mostly found as a greyish coagulum lying at the inner lid-margin. The subjective symptoms are usually slight. Complications with other varieties of catarrhal conjunctivitis are not uncommon. This mild form of conjunctivitis generally lasts for many months, subject to more or less complete disappearance followed by recurrences. It can be rapidly cured by the use of an oxide of zinc ointment, which should be continued for some time after the appearances have altogether passed off.

The conjunctivitis caused by the Koch-Weeks microbe is still more common. It is a more acute type, affects mostly children, and is very contagious and often epidemic. Here the hyperaemia involves both the ocular and the palpebral conjunctiva, and usually there is considerable swelling of the lids and a copious secretion. Both eyes are always affected. Occasionally the engorged conjunctival vessels give way, causing numerous small extravasations (ecchymoses). Complications with phlyctenulae (vide *infra*) are common in children. The acute symptoms last for a week or ten days, after which the course is more chronic. Treatment with nitrate of silver in solution is generally satisfactory. Less frequent microbic causes yield to the same treatment.

A form of *epidemic muco-purulent conjunctivitis* is not uncommon, in which the swelling of the conjunctival folds and lids is much more marked and the secretions copious. It is less amenable to treatment and also apt to be complicated by corneal ulceration. The microbe which gives rise to this condition has not been definitely established. This inflammation is also known as *school ophthalmia*. It is extremely contagious, so that isolation of cases becomes necessary. The treatment with weak solutions of sub-acetate of lead during the acute stage, provided there be no corneal complication, and subsequently with a weak solution of tannic acid, may be recommended.

Purulent Conjunctivitis.—Some of the severer forms of catarrhal conjunctivitis are accompanied not only by much swelling of both conjunctiva and lids but also by a muco-purulent secretion. Nevertheless there is a sufficiently sharply-defined clinical difference between the catarrhal and purulent types of inflammation. In purulent conjunctivitis the oedema of the lids is always marked, often excessive, the hyperaemia of the whole conjunctiva is intense: the membrane is also infiltrated and swollen (chemosis), the papillae enlarged and the secretion almost wholly purulent. Although this variety of conjunctivitis is principally due to infection by gonococci, other microbes, which more frequently set up a catarrhal type, may lead to the purulent form.

All forms are contagious, and transference of the secretion to other eyes usually sets up the same type of severe inflammation. Infection mostly takes place by direct transference through the hands, or secretions containing gonococci either from the eye or some other mucous membrane. The poison may also be carried by flies. The dried secretion loses its virulence.

In new-born children (*ophthalmia neonatorum*) infection takes place from the maternal passages during birth. Notwithstanding the great changes which occur during the progress of a purulent conjunctivitis, there is on recovery a complete *restitutio ad integ-*

rum so far as the conjunctiva is concerned. Owing to the tendency to severe ulceration of the cornea, more or less interference with sight may result before the inflammation has passed off. This is a special danger in adults. For this reason, when only one eye is affected the first point to be attended to in the treatment is to secure the second eye from contagion by efficient occlusion. The appliance known as Buller's shield, a watch-glass strapped down by plaster, is the best for this purpose. It not only admits of the patient seeing with the sound eye but allows the other to remain under direct observation. The treatment otherwise consists in frequent removal of the secretions from the affected eye, and the use of nitrate of silver solution as a bactericide applied directly to the conjunctival surface; sometimes it is necessary to cut away the chemotic conjunctiva immediately surrounding the cornea. When the cornea has become affected efforts may be made with the thermo-cautery or otherwise to limit the area of destruction and thus admit of something being done to improve the vision after all inflammation has subsided.

Phlyctenular conjunctivitis is an acute inflammation of the ocular conjunctiva, in which little blebs or phlyctenules form in the vicinity of the corneal margin and on the epithelial continuation of the conjunctiva which covers the cornea. The inflammation is distributed in little circumscribed foci and not diffused as in all other forms of conjunctivitis. In it the conjunctival secretion is not altered, unless there should exist at the same time a complication with some other form of conjunctivitis. This condition is most frequent in children, particularly if ill-nourished or recovering from some illness, e.g., measles. The susceptibility occurs in fact mainly where there exists what used to be called a "strumous" diathesis. This basis has to do with the susceptibility only, at all events to begin with. The local changes are not tuberculous; their exact origin has not been clearly established. They are in all probability produced by staphylococci.

Many children with phlyctenular conjunctivitis suffer after a short time from eczematous excoriation of the skin of the nostrils, the result of lacrimation. Another frequently distressing symptom is a pronounced dread of light (*photophobia*), which often leads to convulsive and very persistent closing of the lids (*blepharospasm*). Indeed the relief of the photophobia is often the most important point to be considered in the treatment of phlyctenular conjunctivitis. Photophobia may be very severe when the local changes are slight. The best local application is yellow oxide of mercury.

Granular Conjunctivitis.—This disease, also known as *trachoma*, is characterized by an inflammatory infiltration of the adenoid tissue of the conjunctiva. The inflammation is accompanied by the formation of so-called *granules*, and by a hyperplasia of the papillae. The changes further lead in the course of time to cicatricial transformations, so that a gradual and progressive atrophy of the conjunctiva results. The disease takes its origin most frequently in the conjunctival fold of the upper lid, but eventually as a rule involves the cornea and the deeper tissues of the lid, particularly the tarsus.

The cause of trachoma is a filter-passing virus (q.v.). In a distinctive affection when fully established, differential diagnosis from other forms of conjunctivitis, particularly those with much follicular enlargement or purulent from the first, may be difficult. Trachoma is mostly chronic. When occurring in an acute form it is more amenable to treatment and less likely to end in cicatricial changes. Fully half the cases of trachoma extend to the cornea and produce superficial vascularized infiltration (*pannus*). The veiling which pannus produces causes more or less defect of sight.

Various methods of treatment are in use for trachoma. Expression by means of roller-forceps or repeated grattage are amongst the more effective means of surgical treatment, while local applications of copper sulphate or of alum are useful in suitable cases. Recently, the beta radiation from radium emanation enclosed in specially shaped applicators has been used with good effect.

Diphtheritic conjunctivitis may be due to *B. diphtheriae* when the changes are those of diphtheria (q.v.) modified by the

site affected. It may or may not be associated with diphtheria of the throat. It is essentially a disease of early childhood, not more than 10% of all cases occurring after the age of four. A streptococcus infection produces somewhat similar and often quite as disastrous results.

Of non-inflammatory conjunctival affections reference may be made to the following:

Amyloid degeneration, in which waxy-looking masses grow from the palpebral conjunctiva of both lids, often attaining very considerable dimensions. The condition is not uncommon in China and elsewhere in the East.

Essential Shrinking of the Conjunctiva.—This is the result of pemphigus, in which the disease has attacked the conjunctiva and led to its atrophy.

Pterygium is a hypertrophic thickening of the conjunctiva of triangular shape firmly attached by its apex to the superficial layers of the cornea. It is a common condition in warm climates and often calls for operative interference.

Lastly, short reference must be made to the commonest malignant new growths affecting the eye (*see* TUMOUR). These are melanoma, starting in the choroid, glioma starting in the optic nerve or its retinal expansion, epithelioma starting in the conjunctiva, and sarcoma, usually spindle or round celled, starting in the bones of the orbit.

(G. A. B.)

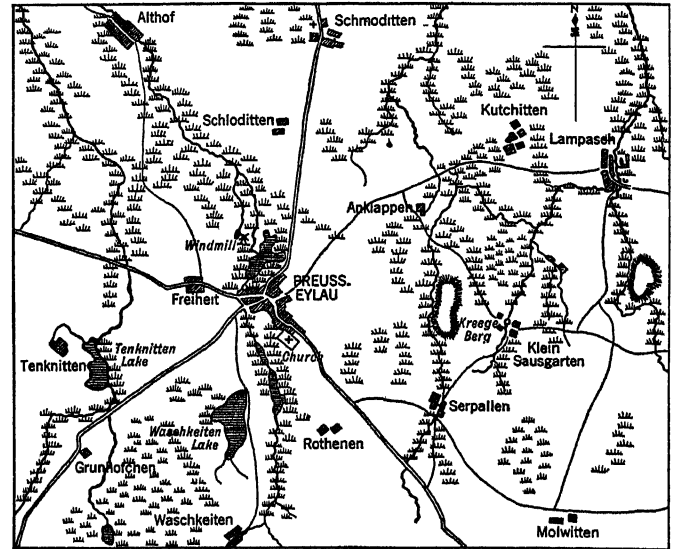

EYEMOUTH, a burgh of barony and parish of Berwickshire, Scotland. Pop. (1931) 2,231. It is situated at the mouth of the Eye, 7½ m. N.N.W. of Berwick-on-Tweed by the L.N.E.R. via Burnmouth. The main industry is herring fishing and allied trades, and Eyemouth was known as a port in the 15th century. The harbour was enlarged in 1887, and the bay is easily accessible and affords good anchorage. The rugged coast, and its numerous ravines and caves, were formerly infested with smugglers. The promontory of St. Abb's Head is 3 m. to the N.W.

EYLAU, a town of Germany, in east Prussia, on the Pasmare, 23 m. S. by E. of Königsberg by rail on the line Pillau-Prostken. It has an Evangelical church, a teachers' seminary, a hospital, foundries and saw mills. Pop. 3,200. Eylau was founded in 1336 by Arnolf von Eilenstein, a knight of the Teutonic Order. It is famous as the scene of a battle between the army of Napoleon and the Russians and Prussians commanded by General Bennigsen, fought on Feb. 8, 1807.

The battle was preceded by a severe general engagement on the 7th. The head of Napoleon's column advancing from the southwest, found itself opposed at the outlet of the Grünhöfchen defile by a strong Russian rearguard which held the (frozen) lakes on either side of the Eylau road. The French turned both wings of the enemy, and Bagration, who commanded the Russian rearguard, retired through Eylau to the main army, which was now arrayed for battle east of Eylau. Barclay de Tolly made a strenuous resistance in Eylau itself, and in the churchyard, and these localities changed hands several times before remaining finally in possession of the French. It is very doubtful whether Napoleon actually ordered this attack upon Eylau, and it is suggested that the French soldiers were encouraged to a premature assault by the hope of obtaining quarters in the village. There is, however, no reason to suppose that this attack was prejudicial to Napoleon's chance of success, for his own army was intended to pin the enemy in front, while the outlying "masses of manoeuvre" closed upon his flanks and rear (*see* NAPOLEONIC CAMPAIGNS). In this case the vigour of the "general advanced guard" was superfluous, for Bennigsen stood to fight of his own free-will.

The foremost line of the French bivouacs extended from Rothenen to Freiheit, but a large proportion of the army spent the night in quarters farther back. The Russian army on the other hand spent the night bivouacked in order of battle. The cold was extreme, and food was scarce in both armies. The ground was covered at the time of battle with deep snow, and all the lakes and marshes were frozen, so that troops of all arms could pass everywhere, so far as the snow permitted. Two of Napoleon's corps (Davout and Ney) were still absent, and Ney did not receive his orders until the morning of the 8th. His task was to descend upon the Russian right, and also to prevent a Prussian corps under

Lestocq from coming on to the battlefield. Davout's corps advancing from the south-east on Mollwitten was destined for the attack of Bennigsen's left wing. In the meantime Napoleon made preparations for the frontal attack. His infantry extended from the windmill, through Eylau, to Rothenen, and the artillery was deployed along the whole front; behind each infantry corps and on the wings stood the cavalry. The Guard was in second line south

MAP OF EYLAU AND SURROUNDING COUNTRY IN GERMANY

The scene of battle between the French army under Napoleon, who, advancing from the southwest, met the Russians and Prussians at Grünhöfchen. The action began at 8 A.M. on Feb. 8, 1807, and ended at nightfall with the retreat of the Russian and Prussian armies.

of Eylau, and an army reserve stood near the Waschkeiten lake. Bennigsen's army was drawn up in line from Schloditten to Klein Sausgarten, the front likewise covered by guns, in which arm he was numerically much superior—having some 200. A detachment occupied Serpallen.

The battle opened in a dense snowstorm. About 8 A.M. Bennigsen's guns opened fire on Eylau, and after a fierce but undecided artillery fight the French delivered an infantry attack from Eylau. This was repulsed with heavy losses, and the Russians advanced towards the windmill in force. Thereupon Napoleon ordered his centre, the VII. Corps of Augereau, to move forward from the church against the Russian front, the division of St. Hilaire on Augereau's right participating in the attack. If we conceive of this first stage of the battle as the action of the "general advance guard," Augereau must be held to have overdone his part. The VII. Corps advanced in dense masses, but in the fierce snowstorm lost its direction. St. Hilaire attacked directly and unsupported; Augereau's corps was still less fortunate. Crossing obliquely the front of the Russian line, as if making for Schloditten, it came under a *feu d'enfer* and was practically annihilated. In the confusion the Russian cavalry charged with the utmost fury downhill and with the wind behind them. Three thousand men only out of about fourteen thousand appeared at the evening parade of the corps. The marshal and every senior officer were amongst the killed and wounded. The Russian counterstroke penetrated into Eylau itself and Napoleon himself was in serious danger. His staff was seized with panic for his safety, and sent for the horses, but Napoleon himself, with the utmost coolness, judged the pace of the Russian advance and ordered up a battalion of the Guard at the exact moment required. In the streets of Eylau the Guard had the Russians at their mercy, and few escaped. Still the situation for the French was desperate and the battle had to be maintained at all costs. Napoleon now sent forward the cavalry along the whole line. In the centre the charge was led by Murat and Bessières, and the Russian horsemen were swept off the field. The Cuirassiers under D'Hautpoul charged through the Russian guns, broke through the first line of infantry and then through the second, penetrating to the woods of Anklappen.

The shock of a second wave of cavalry broke the lines again.

and though in the final retirement the exhausted troopers lost terribly, they had achieved their object. The wreck of Augereau's and other divisions had been reformed, the Guard brought up into first line, and, above all, Davout's leading troops had occupied Serpallen. Thence, with his left in touch with Napoleon's right (St. Hilaire), and his right extending gradually towards Klein Sausgarten, Davout pressed steadily upon the Russian left, rolling it up before him, until his right had reached Kutschitten and his centre Anklappen. By that time the troops under Napoleon's immediate command, pivoting their left on Eylau church, had wheeled gradually inward until the general line extended from the church to Kutschitten. The Russian army was being driven westward, when the advance of Lestocq gave them fresh steadiness. The Prussian corps had been fighting a continuous flank-guard action against Marshal Ney to the north-west of Althof, and Lestocq had finally succeeded in disengaging his main body, Ney being held up at Althof by a small rearguard, while the Prussians, gathering as they went the fugitives of the Russian army, hastened to oppose Davout. The impetus of these fresh troops led by Lestocq and his staff-officer Scharnhorst was such as to check even the famous divisions of Davout's corps which had won the battle of Auerstädt single-handed. The French were now gradually forced back until their right was again at Sausgarten and their centre on the Kreege Berg.

Both sides were now utterly exhausted, for the Prussians also had been marching and fighting all day against Ney. The battle died away at nightfall, Ney's corps being unable effectively to intervene owing to the steadiness of the Prussian detachment left to oppose him, and the extreme difficulty of the roads. A severe conflict between the Russian extreme right and Ney's corps which at last appeared on the field at Schloditten ended the battle. Bennigsen retreated during the night through Schmoditten, Lestocq through Kutschitten—unpursued. The numbers engaged in the first stage of the battle may be taken as—Napoleon, 50,000, Bennigsen, 67,000, to which later were added on the one side Ney and Davout, 29,000, on the other Lestocq, 7,000. The losses were roughly 15,000 men to the French, 18,000 to the Allies, or 21 and 27% respectively of the troops actually engaged.

EYRA, *Felis eyra*, a South American wild cat, of weasel-like build, and uniform colouration, varying from reddish-yellow to chestnut. It is found in Brazil, Guiana and Paraguay, and up to the Rio del Norte, but is rare north of Panama. It is a forest-dweller, active and fierce. The name is sometimes applied to the jaguarondi.

BY COURTESY OF THE N. Y. ZOO. SOC.
THE EYRA, A FIERCE WILDCAT
FOUND IN THE FORESTS OF SOUTH
AMERICA

EYRE, SIR JAMES (1734–1799), English judge, was educated at Winchester college and at St. John's college, Oxford. He was called to the bar at Gray's Inn in 1755 and was appointed recorder of London in 1763. He was counsel for the plaintiff in the case of *Wilkes v. Wood*, and made a brilliant speech in condemnation of the execution of general search warrants. He was appointed a judge of the Exchequer in 1772. From June 1792 to January 1793 he was chief commissioner of the Great Seal. In 1793 he was made chief justice of the common pleas, and presided over the trials of Horne Tooke, Thomas Crosfield and others, with great ability and impartiality. He died on July 1, 1799, and was buried at Ruscombe, Berkshire.

See Howell, *State Trials*, xix. (1154–1155); Foss, *Lives of the Judges*.

EYRE, EDWARD JOHN (1815–1901), British colonial governor, the son of a Yorkshire clergyman, was born at Hornsea on Aug. 5, 1815. He emigrated to New South Wales, where he transported stock westward to the new colony of South Australia, then in great distress. He became magistrate and protector of the aborigines, whose interests he warmly advocated. Already an experienced Australian traveller, he undertook extensive and difficult journeys in the desert country north and west of Adelaide, and proved the possibility of land communication between South and West Australia. In 1845 he returned to England and

published the narrative of his travels *Expeditions into Central Australia and Overland from Adelaide to King George's Sound, 1840–41* (2 vols. 1845). In 1846 he was appointed lieutenant-governor of New Zealand, where he served under Sir George Grey. After successively governing St. Vincent and Antigua, he was in 1861 appointed acting-governor of Jamaica and in 1864 governor. In October 1865 he repressed a negro insurrection. The severity and alleged illegality of Eyre's subsequent proceedings raised a storm in England. Eyre was suspended, and an inquiry instituted. The committee reported that he should not be reinstated. In spite of many indictments brought by various persons against Eyre and his officers for their severities no action was taken by the Government and Eyre retired on pension in the usual way. He died on Nov. 30, 1901.

EYRIE, the alternative English form of the words aerie or aery, the lofty nest of a bird of prey, especially of an eagle; hence any lofty place of abode. The term is also used of the brood of the bird.

EZEKIEL the prophet has recorded, or left us to infer, a few facts about himself. He had been a priest in Jerusalem, most likely a member of the clan of Zadok; while still young he was carried away to Babylonia in the First Captivity, 597 B.C.; his call to prophesy came in 593; after that, he lived in a house of his own, with his wife (xxiv. 18), among the Jewish exiles at Tel Abib on the Grand canal ("the river Chebar" iii. 15), somewhere in the neighbourhood of Babylon or Nippur. His fellow-exiles evidently treated him with respect, and waited upon his words (viii. 1, xiv. 1, xxxiii. 31 f.); judging from xxix. 17, 571 B.C., his ministry lasted 22 years. Some notion of the man may be gathered from his book. He possessed in a high degree the prophetic temperament, a sensitiveness to the reality of the invisible world, which made him respond at once to the touch of the Divine hand (i. 3, viii. 1, etc.), a capacity for absorbed meditation, often passing into the state of trance. While in this condition he saw the moving throne (i.), performed a mimic siege of Jerusalem (iv.), felt himself transported from Babylonia to Jerusalem and back (viii.–xi.), saw the valley full of bones (xxxvii. 1–14), and the great temple of the future (xl. ff.). Often he made use of symbolic actions to enforce his message. At times these acts were performed in the presence of spectators; e.g., xii. 3–16, xxiv. 15–24, xxxvii. 16–20; but some of them must have taken place in vision, while the trance lay on him; e.g., iii. 1–3. Such, at any rate, seems the best account to give of the weird symbolism of ch. iv. and v. 1–4. He was subject to periods of speechlessness, iii. 25f., xxiv. 27; but when the impulse seized him, he would burst into poetry: xv. 1–5; xvii. 1–10; xix.; xxi. 14–22; xxvi. (in part); xxvii. (in part); xxxi. 2–9; xxxii. 2–16. These fine oracles stand out vividly from the monotonous background of his prose.

The Teaching of Ezekiel.—(A.) His conception of God is marked by a deep sense of awe: the holiness and sovereignty of Jahveh were impressed upon the prophet in the vision which constituted his call (ch. i.). Jahveh will brook no rival, and therefore will punish Israel for its disloyalty and the heathen for their false notions of His divinity and power; His motive, whether in punishment or mercy, is to bring about the recognition of His sole Godhead: "and they, or ye, shall know that I am Jahveh" sounds like a refrain throughout the book. Ezekiel thinks in symbols; the ultimate, according to his view, finds expression in the concrete. (B.) Far away in Babylonia, his attention was riveted upon the course of events at home. He denounces Israel's practical heathenism; he insists on the speedy overthrow of the Jewish state, in just requital for centuries of ill-doing (i.–xxiv.). That pessimism in reviewing Israel's past, which became characteristic of later writers, is strongly marked in Ezekiel. He rarely betrays any sympathy with his countrymen (except ix. 8, xi. 13). His hopes were fixed upon the exiles; they were not indeed wholly loyal, yet the future of the true faith lay with them. The message is stern and uncompromising; it was no time for half-measures; Israel's religion was at stake; that it survived at all was largely due to Ezekiel. (C.) As with Israel, so with the nations round, both the petty States that were nearest (xxv.), and

the greater powers of Tyre (xxvi.-xxviii.) and Egypt (xxix.-xxxii., xxxv.): they deserve nothing but the severest judgment, and Nebuchadrezzar is to be the scourge (xxvi., xxx.). Curiously enough, Babylon itself comes in for no denunciation, probably because the prophet, in his bitterness against his own people, regarded the instrument of retribution as on the side of God. Ezekiel holds out no hope for the heathen. (D.) When the news reached Babylonia that Jerusalem had fallen ([586 B.C.] xxxiii. 21 f.), Ezekiel's tone changed. His prophecies of punishment had been fulfilled; he could now look forward to the restoration of the exiles. If he had previously argued the freedom and responsibility of the individual (xviii.), it was not with the aim of encouraging an individualistic type of religion, but of building up a community out of converted individuals. That is the ideal which henceforth occupies his mind: a new Israel, risen as it were from the dead, living in a land transformed, with Jahveh's sanctuary in the midst of them for evermore (xxxvi., xxxvii.). Yet there remains one more act in the Divine plan; the invasion and defeat of all the forces of heathenism, the acknowledgment of Jahveh by all, the final act of history (xxxviii., xxxix.). This apocalyptic conception had an immense influence upon subsequent thought. (E.) But Ezekiel was the most practical of dreamers. In the last section of the book, xl.-xlviii., he describes his vision of the restored temple, the centre of the new community, built on an imposing scale like one of the Babylonian sanctuaries (xl.-xlii.). The glory of Jahveh hallows it once more (xliii. 1-5); every source of defilement is removed; the only priests who minister there are to be the sons of Zadok (xlv. 15 ff.); and from the temple itself flows a mystic stream, cleansing, healing and beneficent (xlvii. 1-12).

Text and Authorship.—The textual criticism of Ezekiel was put upon a new footing by Cornill in 1888; and since that time progress has been made in the scientific use of the Greek and other versions for the correction of the Hebrew text, which is one of the most corrupt and obscure in the Old Testament. At present attention is being devoted to the higher criticism of the book, its literary structure, the origin of its ideas, the history and psychology which it contains. The book gives the impression of being arranged on a systematic plan, with four divisions, i.-xxiv., xxv.-xxxii., xxxiii.-xxxix., xl.-xlviii., in chronological order. Exact dates occur 13 times, but the sequence, though observed in the main, is broken on three occasions, xxvi. 1, xxix. 17, xxxii. 1; the plan, therefore, is not so perfect as it looks. On closer inspection, the four chief divisions turn out to be collections of oracles often independent of each other in time and contents; moreover, the date at the head of a section does not always hold good till the next date is given; for example, ch. vii., which stands under the year 593 (i. 1 f.), seems to belong to 586 B.C., and xl.-xlviii., headed 573 B.C., is mostly composed of far later material. In fact the impression of unity and chronological arrangement gives way under examination; the general plan may have been laid down by the prophet, but other hands have enlarged it. Editors must be held responsible for some, at least, of the headings, and for the double texts which are met with now and then, e.g., ch. i. repeated partly in x., xxxiii. in iii., vii. 5-9=2-4, x. 19=xi. 22 f.

The element of conventionality and repetition which enters largely into the prose of Ezekiel may be in some measure due to scribes, who felt no scruple in glossing the text or altering it to suit their taste. A good instance of their methods is seen in ch. xxvii.; the splendid dirge over Tyre has been cut in two by the insertion of a prose passage, vv. 11-25a, which ruins the unity of the poem. Evidently Ezekiel's writings were studied with keen interest, as we may gather from the final section, xl.-xlviii. The first three chapters, with the additions of xliii. 1-12, xlv. 9-25, 28-30, xlvii. 1-12, are probably the work of the prophet; all that remains in xliii.-xlviii. is made up of fragments, which here and there reveal the technique of the priestly school. They are experiments in legislation. Most of them were never carried out, e.g., the re-distribution of the land, xlvii. 13-xlviii. 35; some were modified later, e.g., the two days of atonement, xlv. 18-20; in fact, what we come upon here is an early stage of the movement

which in the end produced the Priestly Code. The task of reconstruction which Ezekiel had begun was carried on for years in priestly circles, and their tentative regulations were attached to his book, a natural place for them to find a lodging. Historically these enactments stand midway between Deuteronomy and P. Another law-book with which Ezekiel has relations is Lev. xvii.-xxvi., the law of holiness, as it is called; and in this case the relationship is so close that it points to a common time of origin and the same circle of ideas and interests.

The affinity between Ezekiel and Jeremiah is also remarkable. Thus both prophets insist, often in similar language, upon the overthrow of Jerusalem and the temple (e.g., Jer. vii., xxvii.; Ezek. iv. f., vii., xix.-xxiv.); both give up the people of Judah in despair, and fix their hopes upon the exiles (Jer. xxiv., xxix. 10 ff.; Ezek. xi. 16-21, xxxvi. 24 ff.); both proclaim the responsibility of the individual (Jer. xxxi. 29 f.; Ezek. xviii.). They are equally certain that the dispersed will be gathered and return to their native land (Jer. xxxiii. 3, xxxix. 14, xxxi. 8 ff.; Ezek. xi, 17, xx. 34, 41 f.), and that a second David will come to rule over a united nation (Jer. xxxiii. 5 f., xxxiii. 14-16; Ezek. xxxiv. 23 f., xxxvii. 24 f.); and while Jeremiah has not the priestly temper of Ezekiel, yet he too looks forward to the continuance of the Levitical ministry (Jer. xxxiii. 18, 21 f.; Ezek. xlv. 15 ff.). Nevertheless, in spite of all these points of contact with other writings, Ezekiel has an impressive character of its own among the great books of prophecy; none exercised more influence upon subsequent thought and practice, and none perhaps baffles our understanding more.

A different conception from that outlined above has been worked out by Hölscher (1924). Ezekiel, he maintains, was the prophet of doom and of nothing else; he saw but two visions: the one induced him to prophesy the fall of Jerusalem, the other revealed the idolatry in the temple, and roused his fury against the city and its allies, Tyre and Egypt. Ezekiel's own oracles are few, and invariably poetical in form; all else in the book is the work of a redactor, or of several redactors, who lived just before the time of Nehemiah (c. 444-430 B.C.). This view of the book does account for the difference, noticed by every reader, between the monotony of the prose and the passion of the lyrics; but the effect of Hölscher's criticism is to empty the prophecies of all serious meaning, and it is applied on *à priori* principles in a ruthless way which excites distrust.

EZRA, the priest and scribe, one of the principal characters in the chronicler's history of Israel (Chronicles-Ezra-Nehemiah). He is here said to have been sent from Babylon to Jerusalem by the Persian king Artaxerxes (i.e., A. II. 398 B.C.) to restore the neglected law (the Pentateuch). On his arrival, he reads the law to the people, and in accordance with it (Ezra x. 3) accomplishes important reforms. A considerable part of the account of his work has been transposed to the book of Nehemiah, as the result of a copyist's mistake. (See EZRA AND NEHEMIAH, BOOKS OF.) In still later legend, preserved in 2 Esdras xiv., he is said to have restored not only the law, which had been burnt (v. 21), but also all the other Hebrew scriptures which had been destroyed, and seventy apocryphal works in addition. Since the narrative concerning him is written throughout in the chronicler's peculiar diction and style, and in every portion directly serves the apologetic aim of the history of which it is an essential feature, while it is unsupported from any other source, there is very strong reason, in the present writer's opinion, for the conclusion that the character of Ezra was created by the chronicler. (See also CHRONICLES, BOOKS OF.) (C. C. T.)

EZRA, THIRD BOOK OF (1 Esdras). This "book" is variously called 1 Esdras (Greek, Old Latin and Syriac versions, and the English Bible from 1560 onwards); 2 Esdras (Latin Vul-

gate); 3 Esdras (Ethiopic version and some Greek mss.); the Greek Ezra (or Esdras), from the mistaken belief that Greek was the original language; the third book of Ezra (in German usage especially); and there are still other titles. Though one of the so-called Apocrypha, it is very different in character from the other members of the group, for it is merely a portion of the oldest Greek translation of Chronicles—Ezra—Nehemiah. It begins with 2 Chron. xxxv. 1 *seq.*, the account of Josiah's passover, and ends (in the middle of a sentence!) at Neh. viii. 13. The explanation of this fact, as first shown by Torrey, *Ezra Studies*, p. 36, is that a certain number of folded sheets (probably a single ten-leaved quire) had been taken from a Greek codex, with the purpose of preserving a highly important recension which had been abandoned by the Jewish authorities and was in danger of perishing. The portion of the text thus rescued was thenceforth reproduced without change, even the fragmentary clause at the end being retained.

This Greek version was made from a Hebrew-Aramaic text generally identical with our Massoretic text, a skilful translation throughout; not a free rendering, nor a paraphrase. It is rarely difficult to see what Hebrew it represents. It is the work of a single translator and existed in the middle of the 2nd century B.C., and thus antedates by about 300 years the rendering of the canonical Hebrew-Aramaic text by Theodotion which, designated as 2 Esdras, was adopted for the Greek Bible. (See CHRONICLES.)

The 1 Esdras recension differs from the canonical in two very striking particulars: (1) the inclusion of the *Story of the Three Youths* at the court of Darius, with some appended narrative (iii. 1-v. 6) and the accompanying transposition of the account of events in the time of Artaxerxes (ii. 15-25=Ezra iv. 7-24); and (2) the transfer of a portion of the book of Nehemiah to the book of Ezra, the last verse of Ezra x. being immediately followed by Neh. vii. 73-viii. 13a, where the fragment ends.

The Story of the Three Youths.—The three young soldiers who constitute the private bodyguard of Darius engage in a public contest of wit and wisdom. The victor, said to be Zerubbabel, is promised a rich reward by the king; but asks instead to be given permission to restore Jerusalem and the temple. This is granted, and Zerubbabel and Jeshua set out from Babylonia with the company described in chap. ii. of the canonical Ezra. This, however, is not the original form of the story. The parenthesis "this is Zerubbabel" (iv. 13) has long been recognized as an interpolation. The story as told by its author contained no mention of the Jews, nor even a religious element, and seems to have ended with iv. 42. All that follows this verse is incident to the interpolation of the story in the chronicler's history. A portion of the latter, *originally forming the immediate sequel of Ezra i. 11*, is to be recognized in 1 Esdr. iv. 47b-56; v. 1-5 and 6b. The necessary patches composed by the interpolator are iv. 43-47a; 57-61; v. 6a; and he also changed "Cyrus" to "Darius" in v. 2 and slightly altered 6b, which originally read: "in the second year of Cyrus," etc. The impossible "Joakim the son of" in v. 5 came from a misreading of the Hebrew *wayyagom bo*, "and there arose with him."

The purpose of the interpolator seems to have been threefold: to show that Darius II. had a special personal interest in Zerubbabel; to improve the picture of the latter by bringing all his recorded activities into the single reign; and to secure for the Jews this very entertaining bit of wisdom. The attempt succeeded, so completely that the original version perished, leaving only the interpolated form in circulation. This was the form rendered by the Greek translator of the 2nd century B.C., apparently the only form known to Josephus, certainly the only form known in Jerusalem at the beginning of the 2nd century A.D. It was nevertheless in its contradictions of the narrative and chronology of the chronicler an absolutely impossible version of the history; hence the Jewish scholars who finally gave out an authoritative text were obliged to cut out the *Story of the Three Youths* with its appendage. Since the latter contained a portion of the chronicler's history (see above), there is a gap in our canonical Ezra between chaps. i. and ii.

The *Story of the Three Youths* was in Aramaic. The Darius of the story was perhaps Darius III. (*Ezra Studies*, pp. 40 *seq.*), but

more probably Darius I. Hystaspis ("the Mede"); cf. iii. 1 *seq.*, with Dan. vi. 1 *seq.* The names in iv. 29 have been thought to denote actual personages, but it is much more likely that they are mere properties of the story-teller. The name Apama points to the 3rd century as the date of composition of the tale.

The Position of Neh. viii. in 1 Esdras.—The account of the reading of the law by Ezra appears in the 1 Esdras fragment as the sequel of Ezra x. It occupied this position also in the text used by Josephus (*Ant.* xi, v. 5), and it is therefore evident that a version of the history embodying this peculiarity circulated widely and for a long period. The recension containing our Massoretic order of the chapters was also in circulation, however, and it was from this that the rearrangement exhibited by 1 Esdras and Josephus was made, as is shown by the fact that the transposed section begins with v. 72 (not 69!) in Neh. vii. (See EZRA AND NEHEMIAH, BOOKS OF.) The reason for the transposition is very obvious; it was the appreciation of the fact that Ezra, sent by the Persian king to Judaea for the express purpose of proclaiming and administering there the law of God which was already "in his hand" (Ezra vii. 14, 25 *seq.*), could not possibly have waited 13 years before making any public use of it. There may also have persisted a tradition that the account of the reading of the law originally stood in other surroundings, namely in the story of Ezra. In Josephus, Neh. viii. is continued to the end of the chapter, with mention of the feast of tabernacles, and this was certainly the continuation also in the codex from which the 1 Esdras fragment was plucked.

It is important to ascertain, if possible, what followed the account of the reading of the law, in this peculiar and widely used recension. Josephus proceeds with Neh. i-vi., and makes also brief but plain allusion to vii. 4, xi. 1, xii. 27, and xiii. 10 *seq.* Of chaps. ix. and x. he makes no use. It is possible, but not probable, that these two chapters preceded Neh. i. in this recension (as was held in *Ezra Studies*, 31 *seq.*). It seems much more likely that the interpolation of the name of "Nehemiah the son of Hachaliah" in x. 2 (*Ezra Studies*, 282 *seq.*) was made at an early date; and this, with the appearance of "Ezra the Scribe" in xii. 36, would have held the two chapters firmly in their position between vii. 71 (72) and xi. 1. Here, probably, they stood in the 1 Esdras codex and in the text used by Josephus.

EZRA, FOURTH BOOK (OR APOCALYPSE) OF. This is the most profound and touching of the Jewish Apocalypses. It stands in the relation of a sister work to the Apocalypse of Baruch, but though the relation is so close, they have many points of divergence. Thus, whereas the former represents the ordinary Judaism of the 1st century of the Christian era, the teaching of IV Ezra on the Law, Works, Justification, Original Sin and Free Will approximates to the school of Shammai and serves to explain the Pauline doctrines on those subjects.

In the Latin version our book consists of 16 chapters, of which, however, only iii.-xiv. are found in the other versions. To iii.-xiv., accordingly, the present notice is confined. After the example of most of the Latin mss. we designate the book IV Ezra (see Bensly-James, *Fourth Book of Ezra*, pp. xxiv.-xxvii.). As the numerous Graecisms indicate, the Latin version has obviously been derived from a Greek original.

The book consists of seven visions. (1.) iii.-v. 19.—"In the thirtieth year after the ruin of the city I Salathiel (the same is Ezra) was in Babylon and lay troubled upon my bed." In a long prayer Ezra asks how the desolation of Sion and the prosperity of Babylon can be in keeping with the justice of God. The angel Uriel answers that God's ways are unsearchable and past man's understanding. When Ezra asks when the end will be and what are the signs of it, the angel answers that the end is at hand and enumerates the signs.

(2.) v. 14-vi. 34.—Phaltiel, chief of the people, reproaches Ezra for forsaking his flock. Ezra fasts, and in his prayer asks

why God had given up his people into the hands of the heathen. Uriel replies: "Lovest thou that people better than He that made them?" Man cannot find out God's judgment. The end is at hand; its signs are recounted.

(3.) vi. 35-ix. 25.—Ezra recounts the works of creation, and asks why Israel does not possess the world since the world was made for Israel. The answer is that the present state is a necessary stage to the coming one. Then follows an account of the Messianic age and the resurrection, the punishment of the wicked and the blessings of the righteous. There can be no intercession for the departed. Few will be saved—only as it were a grape out of a cluster or a plant out of a forest.

(4.) ix. 26-x. 60.—Ezra eats of herbs in the field of Ardat, and sees in a vision a woman mourning for her only son. Ezra reminds her of the greater desolation of Zion. Suddenly she is transfigured and vanishes, and in her place appears a city. The woman, Uriel explains, represents Zion.

(5.) xi. 1-xii. 39.—Vision of an eagle with three heads, twelve wings and eight winglets, which is rebuked by a lion and destroyed. The eagle is the fourth kingdom seen by Daniel, and the lion is the Messiah.

(6.) xiii.—Vision of a man (*i.e.*, the Messiah) arising from the sea, who destroys his enemies who assemble against him, and gathers to him another multitude, *i.e.*, the lost ten tribes.

(7.) xiv.—Ezra is told of his approaching translation. He asks for the restoration of the Law, and is enabled by God to dictate in 40 days 94 books (the 24 canonical books of the Old Testament that were lost, and 70 secret books for the wise among the people).

While there is diversity of opinion as to whether all these separate pieces are the work of one author, on two points there can hardly be any difference of view: (a) The book contains a great deal of traditional material, especially the eschatological portions; written sources were in all probability drawn upon for this, but the excerpts which were made from such writings have been so interwoven with what the writer himself composed that to indicate precisely how much belongs to a particular source is an extremely difficult, perhaps impossible, task. (b) The final form of the work is due to a redactor who has brought these various pieces into a more or less connected whole.

Since the writer used traditional material much of the essence of the book goes back to a time long before he lived; moreover, the book in its present form, having been worked over by a redactor, must be of later date than that of the original form. But indications in the component parts of the book themselves prove that they were written at different times, though these may all have been within the lifetime of one writer. Details cannot be given here, but there are good reasons for dating the various component parts, as they left the writer's hands, as follows: the first four Visions (iii.-x.), known also as the "Salathiel Apocalypse" (Salathiel = Ezra in iii. 1) belong to about A.D. 100; the "Eagle Vision" (xi.-xii.) to A.D. 96; the "Vision of the Man rising from the Sea" (xiii.) and the "Ezra Legend" (xiv.) to A.D. 100.

See G. H. Box, *The Ezra-Apocalypse* (1912).

(R. H. CH.; W. O. E. O.)

EZRA AND NEHEMIAH, BOOKS OF, in the Old Testament. A Hebrew apologist of the 3rd century B.C. (known as "the Chronicler") wrote with much skill a history of Israel beginning with Adam and ending in the 4th century. Jewish scholars of a later day set apart the latter portion of this history, covering the entire Persian period, under the convenient name "Ezra." In much later Christian usage this in turn was divided into *two* books, Ezra and Nehemiah. The Jewish terminology, however, remained unchanged, and was followed in the Greek and Latin translations. (See CHRONICLES, BOOKS OF.)

The Book of Ezra.—This contains: (1) the story of the return of the Jews, by permission of Cyrus, from Babylonia to Judaea, and of their attempts to restore the worship and rebuild the temple, finally successful under Darius Nothus. (2) the story of Ezra, the leader of a second expedition from Babylonia to Jerusalem, and of his reforms, culminating in the expulsion of the gentile wives, and in a solemn pledge to keep separate from "the

peoples of the land" and to support the service of the temple.

The Hebrew text, as it has come down to us, is not in its original form. A long and important passage of 18 verses, the continuation of Ezra i. 1-11, was cut out, along with the interpolated *Story of the Three Youths*, in the 2nd century A.D. (See EZRA, THIRD BOOK OF.) It contained the account of the provision of Cyrus for the returning exiles, now preserved in the Apocrypha in strange surroundings (1 Esdr. iv. 47b-56; 62-v. 6b). Another accident to the text, in the process of its transmission, has had far more serious consequences. Three chapters which originally belonged to the story of Ezra have been transposed to the book of Nehemiah—with chaos as the result. Neh. vii. 69 (70)—viii. 18 originally followed immediately upon Ezra viii. 36. (The transposition was occasioned by the close resemblance of Ezra ii. 68-iii. 1 to Neh. vii. 69-viii. 1a, coupled with the fact that the chronicler repeated his all-important list of returning exiles, giving it official authentication at both ends of the Persian period.) This first transposition rendered a second absolutely necessary. The original order of the remainder of the Ezra story was Ezra ix., x., Neh. ix., x. Then followed the story of Nehemiah. (Torrey, *Ezra Studies*, chap. viii.)

The chronicler himself was the sole author of the book of Ezra, with the probable exception of the Aramaic section iv. 8-vi. 14. It is plain that every part of the book was composed with the same apologetic purpose, the purpose of the chronicler's whole history, to define and defend (but especially to define) the true "Israel," in opposition particularly to the very dangerous pretensions of the Samaritans, who claimed to be the true heirs of the religious tradition after the destruction of Jerusalem. The question was settled once for all by means of a historical fiction which seems to have originated in the 3rd century B.C. According to this fiction, the Jewish exiles in Babylonia (the sole survivors of the southern kingdom, 2 Chron. xxxvi. 20) returned to Judaea in large numbers, under the Persian rule, and thus restored to Palestine the only pure Israelite blood and the only genuine tradition. The chronicler was persuaded of this, and compiled his history to establish it. The great list (Ezra ii. and Neh. vii.), composed by the chronicler presumably from a census of the loyal families dwelling in Jerusalem and Judaea in the 3rd century, is formally attested both by the Persian officer Sheshbazzar ("the Tirshatha") in 538 and also by Nehemiah in 384 (see below). All the other lists, earlier and later, were constructed with this one in view. The story of Ezra and his law (the Pentateuch) was designed to show—in a most dramatic and impressive manner—that the pure blood received not the slightest contamination.

The list of Persian kings furnished by Ezra-Nehemiah deserves especial attention. The order: Cyrus, Xerxes (iv. 6), Artaxerxes I. (iv. 7-24), Darius II. (v., vi.), Artaxerxes II. (Ezra and Nehemiah), compared with the order of the kings named in the book of Daniel, shows plainly that in the Jewish learned tradition of this late period Darius I. Hystaspis (as "Darius the Mede") was believed to have preceded Cyrus. (See DANIEL, BOOK OF.) With this one exception the chronicler has the correct order; and the history in our Hebrew-Aramaic text is all precisely as he himself composed it, when the story of Ezra is restored to its original sequence (see above). The chronology is of course defective; by the dating which was current Zerubbabel could flourish under both Cyrus and Darius II. (Moore, *Judaism*, i. 6).

Portions of the book are written in the Aramaic language. Of these, vi. 15-18 and vii. 12-26 were certainly composed by the chronicler. It is possible that he was also the author of the remainder, iv. 8-vi. 14. He did not originate the fiction of the totally deserted cities of Judaea, the return from the exile, and the uncontaminated Israel, though it arose in his day. The Aramaic of all these passages has plain characteristics which render it impossible to date it earlier than the 3rd century. (See *Ezra Studies*, pp. 161-166; and especially Baumgartner, *Zeit. alt. test. Wissens.*, 1927, pp. 81-133.)

The Book of Nehemiah.—This contains: (1) the account of the rebuilding of the wall of Jerusalem by Nehemiah. (2) continuation and conclusion of the chronicler's history, consisting mainly of his indispensable census; containing also the (equally

indispensable) account of measures taken in order to confirm and perfect the work of purification accomplished by the chronicler's Ezra.

Nehemiah's remarkable narrative of his great undertaking and its successful accomplishment begins abruptly with a brief super-scription. It ends in chap. vi., with the completion of the wall and its gates in the face of opposition by enemies. The leader of these adversaries is not the Sanballat of the Elephantine papyri (408 B.C.), but his grandson, the one mentioned by Josephus, *Ant.* XI., vii. 2, viii. 2 *sqq.* If we may give credence to the account preserved in Josephus, Nehemiah's adversary afterwards spent some time at the Persian court, and ultimately received his appointment at Samaria from Darius III. It is plain that he was not governor at the time of the events narrated in Neh. i.-vi.; his father (Delaiah?) presumably held that office. The epithet "Horonite" bestowed on him by Nehemiah may mean that he had taken his residence at Beth-horon with the purpose of taking a hand in Jewish affairs. The rebuilding of the wall of Jerusalem was completed in 384 (*see* the evidence presented by Torrey, *The Second Isaiah*, pp. 455-460). Nehemiah's account seems to have been written in 371 (v. 14). Not all of i.-vi. is from his hand, however. In chap. iii., verses 1-32, and probably also 33-37, were written by the chronicler.

The remainder of the book, from vii. 1 onwards, is occupied solely with the chronicler's well known interests. His language, style and habits of composition are everywhere present, and there is no trace of any other hand than his. As was remarked above, the section vii. 69-x. 40 originally formed part of the chronicler's narrative of Ezra, and was at a later day transposed to his narrative of Nehemiah as the result of a copyist's mistake; vii. 68 (69) was immediately followed by xi. One other feature of the *pseudo*-Nehemiah requires mention: xiii. 28 *seq.* is not a *direct* allusion to the break with the Samaritans; the chronicler wishes to show how Nehemiah had dealt with a similar case. He brings his account of Nehemiah's reforms to a

close in precisely the manner in which he had ended the story of Ezra; *cf.* especially xiii. 31 with x. 35 (34) *seq.* This concluding verse of Nehemiah was the original and fitting close of the whole great work.

Bibl.* and the *Jew. Encycl.* For the views here presented, *see* Torrey, *Composition and Historical Value of Ezra-Nehemiah* (1896) and *Ezra Studies* (1910). *See* also Jews. (C. C. T.)

EZZO or **EHRENFRIED** (c. 954-1024), count palatine in Lorraine, was the son of a certain Hermann (d. c. 1000), also a count palatine in Lorraine who had possessions in the neighbourhood of Bonn. Having married Matilda (d. 1025), a daughter of the emperor Otto II., Ezzo came to the front during the reign of his brother-in-law, the emperor Otto III. (983-1002); his power was increased owing to the liberal grant of lands in Thuringia and Franconia which he received with his wife, and some time later his position as count palatine was recognized as an hereditary dignity. Otto's successor, the emperor Henry II., was less friendly towards the powerful count palatine, though there was no serious trouble between them until 1011; but some disturbances in Lorraine quickly compelled the emperor to come to terms, and the assistance of Ezzo was purchased by a gift of lands. Henceforward the relations between Henry and his vassal appear to have been satisfactory. Ezzo died at Saalfeld on March 21, 1024. He left three sons, among them being Hermann, archbishop of Cologne from 1036 to 1056, and Otto, who was for a short time duke of Suabia; and seven daughters, six of whom became abbesses.

EZZOLIED or **ANEGENGE**, a popular old German poem on the life of Christ, written about 1060, by Ezzo of Bamberg. It had a great influence on south German poetry, of which it is an important monument.

Text in Müllenhoff and Scherer, *Denkmäler der d. Poesie und Prosa aus dem 8-12 Jahrh.* (1892).

F

This letter corresponds to the sixth letter of the Greek, Etruscan and Latin alphabets, known to the Greeks as digamma. The sound represented by the letter in Greek was a bilabial spirant similar to English *w*. This sound had disappeared early from the eastern Greek dialects, so that the eastern or Ionic alphabet contained no digamma. It was retained, however, in the Chalcidic and Corinthian alphabets, the sound remaining in these dialects through classical times. The form of the letter in Greek was **Ϝ**, **ϝ**, **Ϟ** or **ϟ**. It does not occur in the Semitic alphabets. Its origin in the Greek alphabet has been a matter of dispute, some maintaining that it descends from Semitic *vau* **ו** and using as evidence the fact that **ν** occurs as a form of the

represented by the letter F alone. It had this value in Etruscan. It was not required in Latin to represent the bilabial spirant (*w*), for the Latins had taken the letter V to represent both this sound and the vowel U. It has represented the unvoiced labial spirant ever since.

In the Faliscan alphabet the letter had the curious form **↑**, and in Latin there was a form **||** corresponding to the form **||** of the preceding letter. Latin cursive of the 5th century A.D. employed a lengthened form **f**, and the letter was generally extended below the line in uncial writing, e.g., **F**. In Irish writing of the 7th century the form was **F**, and the Carolingian with further rounding of the top **f**. From this developed the modern minuscule *f*.

In music, F is the name of the sixth note of the musical alphabet, otherwise the fourth note of the scale of C. It also gives its name to the bass clef, whose distinguishing sign is put on the F line. Further, it serves as an abbreviation for *forte* (*f*) and *fortissimo* (*ff*).

FA, the name given in French and Italian nomenclature to the fourth note of the natural scale of C, i.e., F, and in the Tonic-Sol-fa system and others employing what is called a "movable Do," or tonic, to the fourth note of any major scale.

FABBRONI, ANGELO (1732–1803), Italian biographer, was born at Marradi in Tuscany on Sept. 25, 1732, and died at Pisa on Sept. 22, 1803. His principal work is *Vitae Italorum doctrina excellentium qui saeculis XVII. et XVIII. floruerunt* (20 vols., Pisa, 1778–1799, 1804–1805). The last two vols., published posthumously, contain a life of the author.

FABER, the name of a family of German lead-pencil manufacturers. Their business was founded in 1760 at Stein, near Nuremberg, by Kaspar Faber (d. 1784). It was then inherited by his son Anton Wilhelm (d. 1819). Georg Leonhard Faber succeeded in 1810 (d. 1839), and the business passed to Johann Lothar von Faber (1817–1896), the great-grandson of the founder. At the time of his assuming control about twenty hands were employed, under old-fashioned conditions, and owing to the invention of the French *crayons Contés* of Nicolas Jacques Conté (*q.v.*) competition had reduced the entire Nuremberg industry to a low ebb. Johann brought his factory to the highest state of efficiency, and it became a model for all the other German and Austrian manufacturers. He established branches in New York, Paris, London and Berlin, and agencies in Vienna, St. Petersburg and Hamburg, and made his greatest *coup* in 1856, when he contracted for the exclusive control of the graphite obtained from the East Siberian mines. Faber had also branched out into the manufacture of water-colour and oil paints, inks, slates and slate-pencils, and engineers' and architects' drawing instruments, and built additional factories to house his various industries at New York and at Noisy-le-Sec, near Paris, and had his own cedar mills in Florida. For his services to German industry he received a patent of nobility and an appointment as councillor of state. After the death of his widow (1903) the business was inherited by his granddaughter Countess Otilie von Faber-Castell and her husband, Count Alexander.

digamma in Crete, others that it was merely differentiated from the preceding letter **Ϝ** by the omission of a horizontal stroke. In either case it is probable that the Greeks were not the innovators, seeing that a form of the letter (↗) occurs in the Lydian alphabet. The letter was probably contained in an Asianic alphabet from which Greek, Lydian and Etruscan were derived. The letter passed into the Latin alphabet from the Chalcidic, and we find it used in early inscriptions in combination with *h* to represent the unvoiced labial spirant (English *f*), e.g., in the word **FHEFHAKED**. The *h* was soon dropped, and the sound

FABER, FREDERICK WILLIAM (1814–1863), British hymn-writer and theologian, was born on June 28, 1814 at Calverley, Yorkshire. Educated at Harrow and at Balliol college, Oxford, he was elected fellow of University college in 1837. Meanwhile he had given up Calvinistic views, and had become an enthusiastic follower of John Henry Newman. In 1843, he became rector of Elton in Huntingdonshire, but after a prolonged mental struggle joined the Roman Catholic communion in Nov. 1845. He founded a religious community at Birmingham, called Wilfridians, which was ultimately merged in the oratory of St. Philip Neri, with Newman as Superior. In 1849 a branch of the oratory was established in London, first in King William street, and afterwards at Brompton, over which Faber presided till his death on Sept. 26, 1863. It is mainly as a hymn-writer that Faber is remembered. His other works include *Lives of Modern Saints* (1847 sq.); *The Blessed Sacrament* (1855); *The Creator and the Creature* (1858); *Growth of Holiness* (1854); *Spiritual Conferences* (1859); *The Foot of the Cross* (8 vols., 1853–60); and *Notes on Doctrinal Subjects*, 2 vols. (1866).

See J. E. Bowden, *Life and Letters of Fr. Faber* (2nd ed. 1888), and *A Brief Sketch of the Early Life of the late F. W. Faber, D.D.*, by his brother the Rev. F. A. Faber (1869).

FABER, FABRI or FABRY (surnamed STAPULENSIS), **JACOBUS** [Jacques Lefèvre d'Étaples] (c. 1455–1536), a pioneer of the Protestant movement in France, was born of humble parents at Étaples, Pas de Calais. He had already been ordained priest when he entered the university of Paris, where Hermonymus of Sparta was his master in Greek. He visited Italy before 1486, for he heard the lectures of Argyropolus, who died in that year; he formed a friendship with Paulus Aemilius of Verona. In 1492 he again travelled in Italy, studying in Florence, Rome and Venice, making himself familiar with the writings of Aristotle, though greatly influenced by the Platonic philosophy. Returning to Paris, he became professor in the college of Cardinal Lemoine. Among his famous pupils were F. W. Vatable and Farel; his connection with the latter drew him to the Calvinistic side of the movement of reform. At this time he began the publication, with critical apparatus, of Boëtius (*De Arithmetica*), and Aristotle's *Physics* (1492), *Ethics* (1497), *Metaphysics* (1501) and *Politics* (1506). In 1507 he settled in the Benedictine Abbey of St. Germain des Prés, near Paris, where his former pupil, William Briçonnet, later cardinal bishop of Meaux, was abbot. He now began his Biblical studies, the first-fruit of which was his *Quintuplex Psalterium: Gallicum, Romanum, Hebraicum, Vetus, Conciliatum* (1509); the *Conciliatum* was his own version. This was followed by *S. Pauli Epistolae xiv. ex vulgata editione, adjecta intelligentia ex Graeco cum commentariis* (1512), a work of great independence and judgment. His *De Maria Magdalena et triduo Christi disceptatio* (1517) provoked violent controversy and was condemned by the Sorbonne (1521). At Briçonnet's invitation he went in 1520 to Meaux, and in 1523 published his French version of the New Testament. From this, in the same year, he extracted the versions of the Gospels and Epistles "à l'usage du diocèse de Meaux." Faber was protected by Francis I. and the princess Margaret, but Francis being in captivity after the battle of Pavia (Feb. 25, 1525), he was condemned and his works suppressed by commission of the parliament. With the other Meaux preachers he fled to Strasbourg, but, as soon as Francis returned, he with others, was recalled. Faber now became tutor to one of the king's sons. He issued *Le Psautier de David* (1525), and was appointed royal librarian at Blois (1526); his version of the Pentateuch appeared two years later. His complete version of the Bible (1530), on the basis of Jerome, took the same place as his version of the New Testament. Margaret (now queen of Navarre) led him to take refuge (1531) at Nérac from persecution. He is said to have been visited (1533) by Calvin on his flight from France. He died at Nérac in 1536.

See C. H. Graf, *Essai sur la vie et les écrits* (1842); G. Bonet-Maury, in A. Herzog-Hauck's *Realencyklopädie* (1898).

FABER (or LEFÈVRE), JOHANN (1478–1541), German theologian, styled from the title of one of his works "Malleus Haereticorum," son of one Heigerlin, a smith (*faber*), was born

at Leutkirch, Suabia, in 1478. He studied theology and canon law at Tübingen and at Freiburg im Breisgau, and became vicar of Lindau and Leutkirch and shortly afterwards canon of Basel. In 1518 Hugo von Landenberg, bishop of Constance, made him one of his vicars-general, and Leo X. appointed him papal protonotary. He was an advocate of reforms, in sympathy with Erasmus, and corresponded (1519–20) with Zwingli. While he defended Luther against Eck, he was as little inclined to adopt the position of Luther as of Carlstadt. His journey to Rome in the autumn of 1521 had the result of estranging him from the views of the Protestant leaders. He published *Opus adversus nova quaedam dogmata Lutheri* (1522), appeared as a disputant against Zwingli at Zürich (1523), and then put forth his *Malleus in haeresin Lutheranam* (1524). In 1526 he became court preacher to the emperor Ferdinand, and in 1527–28 was sent by him as envoy to Spain and England. He approved the death by burning of Balthasar Hubmeier, the Baptist, at Vienna on March 10, 1528. In 1531 he was consecrated bishop of Vienna, and combined with this (till 1538) the administration of the diocese of Neustadt. He died at Vienna on May 21, 1541. His works were collected in three volumes, 1537, 1539 and 1541.

See C. E. Kettner, *Diss. de J. Fabri Vita Scriptisque* (1737); Wagenmann and Egli in Herzog-Hauck's *Realencyklopädie* (1898).

FABERT, ABRAHAM DE (1599–1660), marshal of France, was the son of Abraham Fabert, seigneur de Moulins (d. 1638), a famous printer who rendered great services, civil and military, to Henry IV. At the age of fourteen he entered the *Gardes françaises*, and from 1618 was almost constantly in service. He was a brilliant engineer, and at the siege of Stenay he introduced new methods of siegecraft which anticipated in a measure the great improvements of Vauban. In 1658 Fabert was made a marshal of France, being the first commoner to attain that rank. He died at Sedan on May 17, 1660.

See *Histoire du maréchal de Fabert* (Amsterdam, 1697); P. Barre, *Vie de Fabert* (1752); A. Feillet, *Le Premier Maréchal de France plébéen* (1869); Bourelly, *Le Maréchal Fabert* (1880).

FABIAN (FABIANUS), SAINT (d. 250), pope and martyr, was chosen pope in Jan. 236. He was martyred during the persecution under Decius on Jan. 20, 250, and was buried in the catacomb of Calixtus. He is said to have baptized the emperor Philip and his son, to have improved the organization of the church in Rome, to have appointed officials to register the deeds of the martyrs, and to have founded several churches in France.

See *Liber Pontificalis* vol. i. ed. Duchesne (1886) and Eusebius, *Hist. Eccl.* vi. 29.

FABIAN SOCIETY, a Socialist society founded in the winter of 1883–4 by a few obscure young people in London with the ambitious object of "reconstructing society in accordance with the highest moral possibilities." They named themselves after Fabius Cunctator because they realized that "long taking of counsel" was necessary before they could decide how to do it. During the next two or three years the society was joined by four men who have since become eminent, George Bernard Shaw (*q.v.*), Sidney Webb (*q.v.*), Sydney Olivier (later Lord Olivier) and Graham Wallas, and by Mrs. Annie Besant (*q.v.*). In 1889 the society published a volume of essays by these five, with two others, entitled *Fabian Essays in Socialism* which made a considerable stir in Radical circles. The revolutionary Socialism of that period was Marxian and the followers of H. M. Hyndman and even of William Morris based their propaganda on the Marxian law of value. The Fabians rejected the Marxian doctrine both in economics and in politics, holding that Socialism was not a scheme to be adopted on the morrow of the revolution, but a principle already partially embodied in municipal as well as central government and capable of further extension by the action of existing political parties. The publication of *Fabian Essays* explaining these ideas led to the foundation of Fabian societies throughout England, which, however, a few years later were mostly turned into branches of the new Independent Labour Party, a Socialist society which was Fabian except in its political method. Fabian policy explained by numerous *Fabian Tracts* and expounded everywhere by Fabian lecturers exercised much influence both on the

Liberal Party and on the Progressive Party which controlled the London County Council from 1889 to 1906.

Although the Fabians always rejected the idea of making a political party out of the adherents to Socialism, they had long urged the trade unions to form a party of their own, and consequently they co-operated with the unions in founding the British Labour Party in 1900. The success of this new party in the General Election of 1906 startled the country into realizing that Socialism was a coming factor in politics, and at the same time Mr. H. G. Wells (*q.v.*) attempted to hasten its coming by re-organizing the Fabian Society. His controversy with Mr. Bernard Shaw over this scheme attracted much public attention to the society.

The Fabian Society has never had as many as 4,000 members at once, but partly through affiliated societies at the chief universities, many people who have subsequently become influential have passed through its ranks and the plays and writings of its leading members have brought its doctrines before a wide public. Nearly all the leading Socialists and many of the foremost trade unionists have at one time or another become members. Since the War the importance of the Labour Party has somewhat overshadowed that of its constituent elements.

See *The History of the Fabian Society*, by Edward R. Pease (2nd ed., 1925). (E. R. P.)

FABIUS, the name of a number of Roman soldiers and statesmen. The Fabian gens was one of the oldest and most distinguished patrician families of Rome. Its members claimed descent from Hercules and a daughter of the Arcadian Evander. From the earliest times it played a prominent part in Roman history, and was one of the two gentes exclusively charged with the management of the most ancient festival in Rome—the Lupercalia (Ovid, *Fasti*, ii. 375). The chief family names of the Fabian gens or clan, in republican times, were Vibulanus, Ambustus, Maximus, Buteo, Pictor, Dorso, Labeo; with surnames Verrucosus, Rullianus, Gurgus Aemilianus, Allobrogicus (all of the Maximus branch). The most important members of the family are the following:—

1. **MARCUS FABIUS AMBUSTUS**, *pontifex maximus* in the year of the capture of Rome by the Gauls (390). His three sons, sent as ambassadors to the Gauls when they were besieging Clusium, subsequently took part in hostilities (Livy v. 35). The Gauls thereupon demanded their surrender, on the ground that they had violated the law of nations; the Romans, by way of reply, elected them consular tribunes in the following year. The result was the march of the Gauls upon Rome, the battle of the Allia, and the capture of the city (Livy vi. 1).

2. **Q. FABIUS MAXIMUS**, surnamed *Rullianus* or *Rullus*, master of the horse in the second Samnite War to L. Papirius Cursor, by whom he was degraded for having fought the Samnites contrary to orders (Livy viii. 30), in spite of the fact that he gained a victory. In 315, when dictator, he was defeated by the Samnites at Lautulae (Livy ix. 23). In 310 he defeated the Etruscans at the Vadimonian Lake. In 295, consul for the fifth time, he defeated, at the great battle of Sentinum, the combined forces of the Etrurians, Umbrians, Samnites and Gauls (see *ROME: History*, II. "The Republic"). As censor (304) he limited the freedmen to the four city tribes.

3. **QUINTUS FABIUS MAXIMUS**, surnamed *Cunctator* ("the delayer," from his cautious tactics in the war against Hannibal), grandson of the preceding. He served his first consulship in Liguria (233 B.C.), was censor (230) and consul for the second time (228). In 218 he was sent to Carthage to demand satisfaction for the attack on Saguntum (Livy xxi. 18). According to the well-known story, he held up a fold of his toga and offered the Carthaginians the choice between peace and war. When they declared themselves indifferent, he let fall his toga with the words, "Then take war." After the disasters of the Trebia and Lake Trasimene, Fabius was named dictator (Livy calls him pro-dictator, since he was nominated, not by the consul, but by the people) in 217, and began his tactics of "masterly inactivity." Manoeuvring among the hills, where Hannibal's cavalry were useless, he cut off his supplies, harassed him incessantly, and did everything except fight. His steady adherence to his plan caused

dissatisfaction at Rome and in his own camp. Minucius Rufus, his master of the horse, during the absence of Fabius at Rome, made a successful attack upon the enemy. The people then divided the command between Minucius and Fabius (Livy xxii. 15, 24; Polybius iii. 88). Minucius was led into an ambushade by Hannibal, and his army was only saved by the opportune arrival of Fabius. Minucius confessed his mistake and henceforth submitted to the orders of Fabius (Livy xxiii. 32). At the end of the legal time of six months Fabius resigned the dictatorship, and the result of the abandonment of Fabian tactics was the disaster of Cannae (216). In 215 and 214 (as consul for the third and fourth times) he was in charge of the operations against Hannibal together with Claudius Marcellus (Livy xxiii. 39). He laid siege to Capua, which had gone over to Hannibal after Cannae, and captured the important position of Casilinum; in his fifth consulship (209) he retook Tarentum, which had been occupied by Hannibal for three years (Livy xxvii. 15; Polybius xiii. 4; Plutarch, *Fabius*). He died in 203. Fabius was a strenuous opponent of the new aggressive policy, and did all he could to prevent the invasion of Africa by Scipio. In his later years he became morose, and showed jealousy of rising young men, especially Scipio (*Life* by Plutarch; Livy xx.—xxx.; Polybius iii. 87–106).

4. **Q. FABIUS VIBULANUS**, with his brothers Caeso and Marcus, filled the consulship for seven years in succession (485–479 B.C.). In the last year there was a reaction against the family, in consequence of Caeso's espousing the cause of the plebeians. Thereupon the Fabii emigrated from Rome under the leadership of Caeso, and settled on the banks of the Cremera, a few miles above Rome. For two years they defended the city against the Veientes, until at last they were surprised and cut off. The only survivor of the gens was Quintus, the son of Marcus, who apparently took no part in the battle. This Quintus was consul in 467, 465 and 459, and a member of the second decemvirate in 450, on the fall of which he went into voluntary exile (Livy ii. 42, 48–50, iii. 1, 9, 41, 58, vi. 1; Dion Halic. viii. 82–86, ix. 14–22; Ovid, *Fasti*, ii. 195).

The Fabian name is met with as late as the 2nd century A.D. A complete list of the Fabii will be found in de Vit's *Onomasticon*; see also W. N. du Rieu, *Disputatio de Gente Fabia* (1856), containing an account of 57 members of the family.

FABIUS PICTOR, QUINTUS, the father of Roman history, was born about 254 B.C. He took an active part in the subjugation of the Gauls in the north of Italy (225), and after the battle of Cannae (216) was sent by the Romans to consult the Delphic oracle. He was the earliest prose writer of Roman history. His sources were the *Annales Maximi*, *Commentarii Consulares*, and similar records; the chronicles of the great Roman families; and his own experiences in the second Punic war. He is also said to have made much use of the Greek historian Diocles of Peparethus. His work, which was written in Greek, began with the arrival of Aeneas in Italy, and ended with the Hannibalic war. Polybius uses him as his chief authority for the second Punic war. A Latin version existed in the time of Cicero, but it is doubtful whether it was by Fabius Pictor or by a later writer with whom he was confused—Q. Fabius Maximus Servilianus (consul 142); or there may have been two annalists of the name of Fabius Pictor.

Fragments in H. Peter, *Historicorum Romanorum Fragmenta* (1883); see also ANNALISTS and LIVY, and Teuffel-Schwabe, *History of Roman Literature*, § 116. See E. S. Duckett, *Studies in Ennius* (Bryn Mawr college monographs, No. 18).

FABLE. With certain restrictions, the necessity of which will be shown in the course of the article, we may accept the definition of "fable" which Dr. Johnson proposes in his *Life of Gay*: "A fable or apologue seems to be, in its genuine state, a narrative in which beings irrational, and sometimes inanimate (*arborea loquuntur, non tantum ferae*), are, for the purpose of moral instruction, feigned to act and speak with human interests and passions." The description of La Fontaine, the greatest of fabulists, is a poetic rendering of Johnson's definition:

Fables in sooth are not what they appear;
Our moralists are mice, and such small deer.
We yawn at sermons, but we gladly turn
To moral tales, and so amused we learn.

The fable is distinguished from the myth which grows and is not made, the spontaneous and unconscious product of primitive fancy as it plays round some phenomenon of natural or historical fact. The literary myth, such as, for instance, the legend of Pandora in Hesiod or the tale of Er in the *Republic* of Plato, is really an allegory, and differs from the fable in so far as it is self-interpreting; the story and the moral are intermingled throughout. Between the parable and the fable there is no clear line of demarcation. The soundest distinction is drawn by Neander. In the fable human passions and actions are attributed to beasts; in the parable the lower creation is employed only to illustrate the higher life and never transgresses the laws of its kind. There is an affinity between the fable and the proverb. A proverb is often a condensed or fossilized fable, and not a few fables are amplified or elaborated proverbs.

With the fable, as we know it, the moral is indispensable. As La Fontaine puts it, an apologue is composed of two parts, body and soul. The body is the story, the soul the morality. But in the primitive beast-fable, which is the direct progenitor of the Aesopian fable, the story is told simply for its own sake, and is as innocent of any moral as the fairy tales of Little Red Riding-Hood and Jack and the Beanstalk. Thus, in a legend of the Flat-head Indians, the Little Wolf found in cloud-land his grandsires the Spiders with their grizzled hair and long crooked tails, and they spun balls of thread to let him down to earth; when he came down and found his wife, the Speckled Duck, whom the Old Wolf had taken from him, she fled in confusion, and this is why she lives and dives alone to this very day. Such animal myths are as common in the New World as in the Old, and abound from Finland and Kamchatka to the Hottentots and Australasians.

From these beast-fables of savages must be derived, through some common store of primitive moralizing, the fables of Greece and India. In the form in which we have them the Greek fables are the older: there is a fable of true type in Hesiod. In the latter part of the 5th century B.C. they became connected with the name of Aesop. The first collection we hear of was made about 300 B.C. These Greek fables are best represented by the verse collection of Babrius (q.v.) made about A.D. 200. An inferior version is found in the Latin of Phaedrus (early part of the 1st century). Phaedrus and a third ancient fabulist Avianus (4th century) were textbooks in mediaeval schools and were constantly imitated and expanded.

The oldest Indian collection, the *Panchatantra*, goes back to Buddhist sources of the 4th century or earlier. The *Hitopadesa* is a mediaeval form of the same work, the fables being strung together on a thread of narrative. As *Kalilah and Dimnah* or *Fables of Bidpai* (*Pilpay*) the Indian fables passed through Old Persian and Arabic into Latin, and joined the stream flowing from the Latin fabulists, thus fertilizing the rising vernacular literatures with a variety of *motifs* which could be used either for entertainment or edification. One of the most successful mediaeval collections is that of Odo of Cheriton, a Kentish preacher of the 12th century, who published separately the fables he had used in his sermons.

Modern Literature.—As the supremacy of Latin declined, the fable took a new life in the modern languages. Not only were there numerous adaptations of Aesop, known as Ysopets, but Marie de France in the 13th century composed many original fables, some rivalling La Fontaine's in simplicity and gracefulness. Later, also, fables were not wanting, though not numerous, in the English tongue. Chaucer has given us one, in his Nonne Preste's Tale, which is an expansion of the fable *Don Coc et don Werpil* of Marie de France; another is Lydgate's tale of The Churl and the Bird.

Several of Odo's tales, like Chaucer's story, can be ultimately traced to the History of Reynard the Fox. This great beast-epic is known to us in three forms, Latin, French and German, each with independent episodes, but all woven upon a common basis, and it probably took shape in Picardy in the 10th or 11th century. The Latin form is probably the earliest, and next the German versions. The French poem of more than 30,000 lines, the *Roman du Renard*, belongs probably to the 13th century. In

1498 appeared *Reynke de Voss*, almost a literal version in Low Saxon of the older Flemish poem, *Reinaert de Vos*. Hence the well-known version of Goethe into modern German hexameters was taken. We have here no short and unconnected stories. Materials, partly borrowed from older apologues, but in a much greater proportion new, are worked up into one long and systematic tale. The moral, so prominent in the fable proper, shrinks so far into the background that the epic might be considered a work of pure fiction, an animal romance recounting a contest maintained successfully, by selfish craft and audacity, against enemies of all sorts, in a half-barbarous and ill-organized society.

France alone in modern times has attained any pre-eminence in the fable, and this distinction is almost entirely owing to one author. Marie de France in the 13th century, Gilles Corrozet, Guillaume Haudent and Guillaume Gueroult in the 16th, are now studied mainly as the precursors of La Fontaine, from whom he may have borrowed a stray hint or the outline of a story. The unique character of his work has given a new word to the French language: other writers of fables are called *fabulistes*, La Fontaine is named *le fablier*. He is a true poet; his verse is exquisitely modulated; his love of nature often reminds us of Virgil, as do his tenderness and pathos (*see*, for instance, The Two Pigeons and Death and the Woodcutter). He is full of sly fun and delicate humour; like Horace he satirizes without wounding, and "plays around the heart." Lastly, he is a keen observer of men. The whole society of the 17th century, its greatness and its foibles, its luxury and its squalor, from *Le grand monarque* to the poor *manant*, from his majesty the lion to the courtier of an ape, is painted to the life. To borrow his own phrase, La Fontaine's fables are "une ample comédie à cent actes divers." Rousseau did his best to discredit the *Fables* as immoral and corruptors of youth, but in spite of *Émile* they are studied in every French school and are more familiar to most Frenchmen than their breviary. Among the French successors of La Fontaine the most distinguished is Florian: among foreigners who have worked in his vein are the Spaniard Yriarte, the Russian Krylov, and the Italian Pignotti. John Gay's *Fifty-one Fables in Verse* (1727) has much of the charm of La Fontaine. Dryden's *Fables* (1699) are adaptations of Chaucer's and Boccaccio's tales and Ovid's *Metamorphoses* and are fables only in name.

The fables of Lessing represent the reaction against the French school of fabulists. "With La Fontaine himself," says Lessing, "I have no quarrel, but against the imitators of La Fontaine I enter my protest." His attention was first called to the fable by Gellert's popular work published in 1746. Gellert's fables were closely modelled after La Fontaine's, and were a vehicle for lively railings against women, and hits at contemporary follies. Lessing's early essays were in the same style, but his subsequent study of the history and theory of the fable led him to discard his former model as a perversion of later times, and the "Fabeln," published in 1759, are the outcome of his riper views. Lessing's fables, like all that he wrote, display his vigorous common sense, but he has little of La Fontaine's sly humour and lightness of touch. On the other hand, he has the rare power of looking at both sides of a moral problem; he holds a brief for the stupid and the feeble, the ass and the lamb; and in spite of his formal protest against poetical ornament, there is in not a few of his fables a vein of true poetry, as in the Sheep (ii. 13) and Jupiter and the Sheep (ii. 18). But the monograph which introduced the *Fabeln* is of more importance than the fables themselves. According to Lessing the ideal fable is that of Aesop. All the elaborations and refinements of later authors, from Phaedrus to La Fontaine, are perversions of this original. The fable is essentially a moral precept illustrated by a single example, and it is the lesson thus enforced which gives to the fable its unity and makes it a work of art.

Pares (1921); *Biography of John Gay*, ed. W. H. K. Wright (1923).

FABLIAU. The entertaining tales in eight-syllable rhymed verse which form a marked section of French mediaeval literature are called *fabliaux*, the word being derived by Littré from *fable*, a diminutive of *fabule*. It is a mistake to suppose, as is frequently done, that every legend of the middle ages is a fabliau. In a poem of the 12th century a clear distinction is drawn between songs of chivalry, war or love, and *fabliaux*, which are recitals of laughter. A fabliau always related an event; it was usually brief, containing not more than 400 lines; it was neither sentimental, religious nor supernatural, but comic and gay. About 150 fabliaux have come down to us more or less intact; a vast number have doubtless disappeared. As early as the 8th century fabliaux must have existed, since the faithful are forbidden to take pleasure in these *fabulas inanes* by the *Paenitentiale* of Egbert. But the earliest surviving fabliau is that of *Richent*, which dates from 1159. This is a rough and powerful study of the coarse life of the day, with little plot, but engaged with a realistic picture of manners. Such poems, but of a more strictly narrative nature, continued to be produced, mainly in the north and north-east of France, until the middle of the 14th century. It does not seem probable that any ancient or exotic influences were brought to bear upon the French jongleurs, who simply invented or adapted stories of that universal kind which springs unsown from every untilled field of human society. More remarkable than the narratives themselves is the spirit in which they are told. This is full of the national humour and the national irony, the true *esprit gaulois*. A very large section of these popular poems deals satirically with the pretensions of the clergy. There are also tales whose purpose is rather voluptuous than witty, and whose aim is to excuse libertinage and render marriage ridiculous. Among these are prominent *Court Mantel* and *Le Dit de Berenger*. Yet another class repeated, with a strain of irony or oddity, such familiar classical stories as those of Narcissus, and Pyramus and Thisbe.

The object of the writers was the immediate amusement of their audience; by reference to familiar things, they hoped to arouse a quick and genuine merriment. Hence in the fabliaux we get closer than elsewhere to the living diction of mediaeval France. Such scholars as Gaston Paris and Paul Meyer have praised, in the general laxity of style and garrulity of the middle ages, the terseness of the jongleurs; in the period of false ornament, their fidelity to nature; in a time of general vagueness, the sharp and picturesque outlines of their art. One feature of the fabliaux, however, cannot be praised and yet must not be overlooked. In no other section of the world's literature is the scorn and hatred of women so prominent. It is difficult to account for the anti-feminine rage which pervades the fabliaux, and takes hideous shapes in such examples as *Le Valet aux deux femmes*, *Le Pêcheur de Pont-sur-Seine* and *Chicheface et Bigorne*. Probably this was a violent reaction against the extravagant cult of woman as expressed in the contemporary *lais* as well as in the legends of saints. We must remember, too, that those who listened were not nobles or clerks, they were the common people. The fabliaux were *fabellae ignobilium*, little stories told to amuse persons of low degree, who were irritated by the moral pretensions of their superiors.

The names of about 20 of the authors of fabliaux have been preserved, although in most cases nothing is known of their personal history. The most famous is the man whose name, or more probably pseudonym, was Rutebeuf. He wrote *Frère Denyse* and *Le Sacristain*, while to him is attributed the *Dit d'Aristotele*, in the course of which Aristotle gives good advice to Alexander. Fabliaux, however, form but a small part of the work of Rutebeuf, who was a satirical poet of wide accomplishment and varied energy. Henri d'Andeli was an ecclesiastic, attached, it is supposed, to the cathedral of Rouen. Jean de Condé, who flourished in the court of Hainaut from 1310 to 1340, and who is the latest of the genuine writers of fabliaux, lived in comfort and security, but most of the professional jongleurs seem to have spent their years in a Bohemian existence, wandering among the clergy and the merchant class, alternately begging for money and food and reciting their mocking verses.

BIBLIOGRAPHY.—The principal authorities for the fabliaux are

Anatole de Montaiglon and Gaston Raynaud, who published the text, in 6 vols., between 1872 and 1890. This edition supplemented the labours of Méon (1808-23) and Jubinal (1839-42). The works of Henri d'Andeli were edited by A. Heron in 1880, and those of Rutebeuf by Léon Clédât in 1891. See also the editions of separate fabliaux by Gaston Paris, Paul Meyer, Ebeling, August Scheler and other modern scholars. Joseph Bédier's *Les Fabliaux* (1925) is a useful summary of critical opinion on the entire subject.

FABRE, FERDINAND (1830-1898), French novelist, was born at Bédarieux, in Hérault, a very picturesque district of the south of France, which he made completely his own in literature. He was brought up by his uncle, the Abbé Fulcran Fabre, at Camplong among the mulberry woods. Of his childhood and early youth he has given a charming account in *Ma Vocation* (1889). He was sent to the seminary of St. Pons de Thomières, where, in 1848, he had, as he believed, a vision in which he was warned not to become a priest. He was then articled as a lawyer's clerk in Paris. In 1853 he published a volume of verses, *Feuilles de lierre*, broke down in health, and returned to his old home at Bédarieux. After some eight or nine years he reappeared in Paris, with the ms. of his earliest novel, *Les Courbezons* (1862), in which he treated the daily business of country priests in the Cevennes. George Sand praised it, Sainte-Beuve hailed its author "the strongest of the disciples of Balzac," and it was crowned by the French Academy. Fabre wrote about 20 novels. His masterpiece was *L'Abbé Tigrane, candidat à la papauté* (1873), a very powerful picture of unscrupulous priestly ambition. Others are: *Mon Oncle Célestin* (1881), a study of the entirely single and tender-hearted country abbé; and *Lucifer* (1884), a marvellous gallery of serious clerical portraits.

In 1883 Fabre was appointed curator of the Mazarin library, with rooms in the Institute, where on Feb. 11, 1898, he died after a brief attack of pneumonia. Ferdinand Fabre was a "regional" novelist, dealing almost exclusively with the population of the mountain villages of Hérault, and particularly with its priests.

See J. Lemaitre, *Les Contemporains* (1886-99) vol. ii.; G. Pellissier, *Études de littérature contemporaine* (1898); E. W. Gosse, *French Profiles* (1905).

FABRE, JEAN HENRI (1823-1915), French entomologist, was born of humble parents at St. Léons in Aveyron on Dec. 21, 1823. Having received an elementary classical education at Rodez and at the école normale of Vaucluse, he taught successively at Carpentras, at the college of Ajaccio, Corsica, and in 1852 at the lycée of Avignon. Meanwhile he had taken his doctor's degree in Paris and had discovered that his life-work was to be the study of the life-history, habits and instincts of insects, a study which became his sole occupation after his retirement to Sérignan in 1871. There he lived an extremely secluded life, absorbed in his study. He took no account of books, and all his work was based on direct observation. Although the ways of all insects interested him, his attention was given chiefly to the hymenoptera, coleoptera, orthoptera, as well as to spiders. Of the first, the wasps, with their skill in stinging their prey in the region of the nervous ganglia so as to paralyse it and preserve it living as food for their young, seemed to Fabre to show an intelligence irreconcilable with the theory of fixed habits. Other researches led him to oppose the theory of evolution. His incomparable observations, his deductions concerning the relation between the animal and the human mind, and between entomology and agriculture, are detailed in *Annales des sciences naturelles* (1855-58) and in the 10 vols. of *Souvenirs entomologiques* (1879-1907) (Eng. trans. by De Mattos, 1912 sqq.) which was crowned by the Institute of France. A member of many academies and scientific societies, Fabre died at Sérignan, Provence, on Oct. 11, 1915.

See A. Fabre, *Jean-Henri Fabre* (Eng. trans., 1921); C. V. Legros, *Fabre, Poet of Science* (Eng. trans., 1913); and P. F. Bicknell, *The Human Side of Fabre* (New York, 1923). See also BEE and INSECTS.

FABRE D'ÉGLANTINE, PHILIPPE FRANÇOIS NAZAIRE (1750-1794), French dramatist and revolutionist, was born at Carcassonne. His real name was simply Fabre, the "d'Eglantine" being added in commemoration of his receiving the golden eglantine of Clémence Isaure from the academy of the floral games at Toulouse. Of his plays, *Philinte, ou la suite du*

Misanthrope (1790), which professes to be a continuation of Molière's *Misanthrope*, is best remembered. The character of Philinte had much political significance. Alceste received the highest praise, and evidently represents the citizen patriot, while Philinte is a dangerous aristocrat in disguise. Fabre was president and secretary of the club of the Cordeliers, and belonged also to the Jacobin club. He was private secretary to Danton, and sat in the National Convention. He voted for the king's death, supporting the *maximum* and the law of the suspected, and he was a bitter enemy of the Girondins. He sat on the committee entrusted with the formation of the republican calendar, and to him was due a large part of the new nomenclature, with its poetic *Prairial* and *Floréal*, its prosaic *Primidi* and *Duodi*. On Jan. 12, 1794, he was arrested by order of the committee of public safety on a groundless charge of malversation and forgery in connection with the affairs of the Compagnie des Indes. During his trial Fabre showed the greatest calmness and sang his own well-known song of *Il pleut, il pleut, bergère, rentre tes blancs moutons*. He was guillotined on April 5, 1794. On his way to the scaffold he distributed his manuscript poems to the people.

A posthumous play, *Les Précepteurs*, steeped with the doctrines of Rousseau's *Emile*, was performed on Sept. 17, 1794, and met with an enthusiastic reception. Among Fabre's other plays are *Convalescent de qualité* (1791), and *L'Intrigue épistolaire* (1791). In the latter play Fabre is supposed to have drawn a portrait of the painter Greuze.

The author's *Oeuvres mêlées et posthumes* were published at Paris, 1802, 2 vols. See A. Maurin, *Galerie hist. de la Révolution française*, tome 11; J. Janin, *Hist. de la litt. dram.*; Chénier, *Tableau de la litt. française*; F. A. Aulard in the *Nouvelle Revue* (July 1885); D'Alméras, *Fabre d'Eglantine* (1905).

FABRETTI, RAPHAEL (1618–1700), Italian antiquary, was born in 1618 at Urbino in Umbria. He studied law at Cagliari and Urbino, where he took the degree of doctor at the age of 18. He was treasurer and auditor of the papal legation in Spain, where he remained 13 years. By Innocent XII. he was made keeper of the archives of the castle St. Angelo, a charge which he retained till his death. He died at Rome on Jan. 7, 1700.

He wrote: *De Aquis et Aquae-ductibus veteris Romae* (1680), three dissertations on the topography of ancient Latium, printed also in Graevius's *Thesaurus*, iv. (1677); *De Columna Trajani Syntagma* (1683), and *Inscriptionum Antiquarum Explicatio* (1699).

See J. Lamius, *Memorabilia Italorum eruditione praestantium* (Florence, 1742–48).

FABRIANI, SEVERINO (1792–1849), Italian author and teacher, was born at Spilamberto, Italy, on Jan. 7, 1792. In consequence of complete loss of voice he resolved to devote himself to teaching deaf mutes, and founded a small school specially for them. This school the duke of Modena made into an institute, and a teaching staff of nuns was appointed. Fabriani's method of instruction is summed up in his *Logical Letters on Italian Grammar* (1847). He died on April 27, 1849.

FABRIANO, GENTILE DA: see GENTILE DA FABRIANO.

FABRIANO, a town and episcopal see of the Marches, Italy, province of Ancona, from which it is 44 m. S.W. by rail, 1,066 ft. above sea-level. Pop. (1921) town 8,679, commune 25,209. It has been noted since 1276 for its paper mills. A number of the churches, several of which are of the 13th century, contain works by Allegretto Nuzi (1308–1385) and other local masters. His pupil, Gentile da Fabriano (1370–1427), was a painter of greater skill. The mediaeval Palazzo del Podestà (13th century) is picturesque, and there are other interesting buildings. The municipal picture gallery also contains an interesting collection of pictures. The Archivio Comunale contains documents on watermarked paper of local manufacture going back to 1293–94. Cement, pottery and vats are also made. A branch railway leads hence to Arbino (q.v.).

See A. Zonghi, *Antiche Carte-Fabrianesi*.

FABRICIUS, GAIUS LUSCINUS (i.e. "the one-eyed"), Roman general, was the first member of the Fabrician gens who settled in Rome. He migrated to Rome from Aletrium (Livy ix. 43). In 285 he was one of the ambassadors sent to the Tarentines

to dissuade them from making war on the Romans. In 282 B.C. (when consul) he defeated the Bruttians and Lucanians, who had besieged Thurii (Livy, *Epit.* 12). After the defeat of the Romans by Pyrrhus at Heraclea (280), Fabricius was sent to treat for the ransom and exchange of the prisoners. All attempts to bribe him were unsuccessful, and Pyrrhus is said to have been so impressed that he released the prisoners without ransom (Plutarch, *Pyrrhus*, 18). In 278 Fabricius was elected consul for the second time, and was successful in negotiating terms of peace with Pyrrhus. Fabricius afterwards gained a series of victories over the Samnites, the Lucanians and the Bruttians, and on his return to Rome received a triumph. He died poor, and provision had to be made for his daughter out of the funds of the state (Val. Max. iv. 4, 10).

FABRICIUS, GEORG (1516–1571), German poet, historian, and archaeologist, was born at Chemnitz in upper Saxony on April 23, 1516, and educated at Leipzig. While travelling in Italy he studied the antiquities of Rome. He published the results in his *Roma* (1550), in which the correspondence between every discoverable relic of the old city and the references to it in ancient literature were traced in detail. In 1546 he was appointed rector of the college of Meissen, where he died, July 17, 1571.

Principal works; editions of Terence (1548) and Virgil (1551); *Poëmatum sacrorum libri xxv.* (1560); *Poëtarum veterum ecclesiasticorum opera Christiana* (1562); *De Re Poëtica libri septem* (1565); *Rerum Misnicarum libri septem* (1569); (posthumous) *Originum illustrissimae stirpis Saxonicae libri septem* (1597); *Rerum Germaniae magnae et Saxoniae universae memorabilium mirabiliumque volumina duo* (1609). A life of Georg Fabricius was published in 1839 by D. C. W. Baumgarten-Crusius, who in 1845 also issued an edition of Fabricius's *Epistolae ad W. Meurerum et alios aequales*, with a short sketch *De Vita Ge. Fabricii et de gente Fabriciorum*; see also F. Wachter in Ersch and Gruber, *Allgemeine Encyclopädie*.

FABRICIUS, HIERONYMUS AB AQUAPENDENTE (Fabrizio, Geronimo) (1537–1619), Italian anatomist and embryologist, studied at Padua, where he succeeded his master Fallopius, as teacher of anatomy and surgery, in 1562. Here his studies of the effect of ligatures and the valves in the veins influenced the discoveries of his famous pupil, William Harvey. Fabricius was greatest as a teacher; he failed to follow his own discoveries to their logical conclusion. Dr. C. Singer (*History of Medicine*, 1928) calls him the "effective founder of modern embryology." He died at Venice on May 21, 1619. His works include *De visione, voce et auditu* (1600), *De formato foetu* (1600), *De venarum ostiis* (1603) and *De formatione ovi et pulli* (1621). His collected works were published at Leipzig in 1687 as *Opera omnia Anatomica et Physiologica*, but the Leyden edition, published by Albinus in 1738, is more complete.

FABRICIUS, JOHANN ALBERT (1668–1736), German classical scholar and bibliographer, was born at Leipzig. His father, Werner Fabricius, director of music in the church of St. Paul at Leipzig, was the author of several works, the most important being *Deliciae Harmonicae* (1656). Johann Albert studied under J. G. Herrichen and afterwards at Quedlinburg under Samuel Schmid. At Leipzig he published anonymously (1688) his first work, *Scriptorum recentiorum decas*, an attack on ten writers of the day. His *Decas Decadum, sive plagiariorum et pseudonymorum centuria* (1689) is the only one of his works to which he signs the name Faber. In 1693 he settled at Hamburg as librarian to J. F. Mayer. In 1696 he accompanied his patron to Sweden; and in 1699 succeeded Vincent Placcius in the chair of rhetoric and ethics, a post which he held till his death.

Fabricius is credited with 128 books, but very many of them were only books which he had edited. One of the most famed and laborious of these is the *Bibliotheca Latina* (1697, republished in an improved and amended form by J. A. Ernesti, 1773). The divisions of the compilation are—the writers to the age of Tibertius; thence to that of the Antonines; and thirdly, to the decay of the language; a fourth gives fragments from old authors, and chapters on early Christian literature. A supplementary work was *Bibliotheca Latina mediae et infimae Aetatis* (1734–36; supplementary volume by C. Schöttgen, 1746; edit. Mansi, 1754). His *chef-d'oeuvre*, however, is the *Bibliotheca Graeca* (1705–28, revised and continued by G. C. Harles, 1790–1812), a work

which has justly been denominated *maximus antiquae eruditionis thesaurus*. Its divisions are marked off by Homer, Plato, Christ, Constantine, and the capture of Constantinople in 1453, while a sixth section is devoted to canon law, jurisprudence and medicine. Of his remaining works we may mention: *Bibliotheca Antiquaria*, an account of the writers whose works illustrated Hebrew, Greek, Roman and Christian antiquities (1713); *Centifolium Lutheranicum*, a Lutheran bibliography (1728); *Bibliotheca Ecclesiastica* (1718). His *Codex Apocryphus* (1703) is still considered indispensable as an authority on apocryphal Christian literature.

The details of the life of Fabricius are to be found in *De Vita et Scriptis J. A. Fabricii Commentarius* (Hamburg, 1737), by his son-in-law, H. S. Reimarus, the well known editor of Dio Cassius; see also C. F. Bähr in Ersch and Gruber's *Allgemeine Encyclopädie*, and J. E. Sandys, *Hist. Class. Schol.*, iii. (1908).

FABRICIUS, JOHANN CHRISTIAN (1745–1808), Danish entomologist and economist, was born at Tondern on Jan. 7, 1745. He studied at Altona and Copenhagen and at Uppsala under Linnaeus. In 1769, he lectured on political economy and in 1775 was appointed professor of natural history, economy and finance at Kiel. He died on March 3, 1808. It is as an entomologist that his memory survives, and for many years his great scientific reputation rested upon the system of classification which he founded upon the structure of the mouth-organs instead of the wings.

A list of his entomological publications in Hagen's *Bibliotheca Entomologiae*; the following are the chief: *Systema Entomologiae* (1775); *Genera Insectorum* (1776); *Philosophia Entomologica* (1778); *Species Insectorum* (1781); *Entomologia Systematica* (1792–1794), with a supplement (1798); *Systema Eleutheratorum* (1801). In the *Transactions of the Entomological Society of London* (1845), 4, his autobiography is translated from the Danish.

FABRITIUS, CAREL (1624?–1654), Dutch painter. The date and place of his birth is unknown. From a description of Delft dated 1667, wherein it is said that the master was killed in an explosion at Delft on Oct. 12, 1654, and that he was then about 30 years of age we learn that he must have been born about 1624. He was a pupil of Rembrandt, and he appears as a serious and cultivated artist in the conversation on art of Rembrandt's pupils which is reported by Hoogstraten. In 1650 he married Agathe van Pruysen, a widow in Delft, and in 1652 he entered the painters' guild in that city. He was a master of the first rank, an independent spirit who did not lose his own individuality while studying under the great Rembrandt. He seems to have first established a reputation in painting mural decorations with views of architecture in perspective. But of these works nothing remains. However, the pictures which are still extant show an artist of great power.

The earliest work is the half-length portrait of Abraham de Notte in the Rijks museum at Amsterdam. It is dated 1640 and is the work of a mature artist. A portrait of a man in the museum at Rotterdam was attributed to Rembrandt until the signature of Fabritius was discovered. The National Gallery, London, has a splendid half-length portrait of a soldier. In the same collection is the picture of "A musical instrument dealer with a view of Delft." The museum at Schwerin contains "The sentinel," dated 1654, and the Ferdinandeum at Innsbruck the picture of "Tobias and his wife." In the Mauritshuis at The Hague is the famous "Goldfinch," signed and dated 1654. In distinction to Rembrandt, whose figures emerge modelled by the action of light from a dark background, the figures of Fabritius are silhouetted against a light background, a scheme which was adopted and developed by Fabritius's great pupil, Vermeer.

See Hoistede de Groot, *Catalogue of Dutch Painters* (1902).

FABRIZI, NICOLA (1804–1885), Italian patriot, was born at Modena on April 4, 1804. He took part in the Modena insurrection of 1831, and attempted to succour Ancona, but was arrested at sea and taken to Toulon, whence he proceeded to Marseilles. Afterwards he organized with Mazzini the ill-fated Savoy expedition. Taking refuge in Spain, he fought against the Carlists, and was decorated for valour on the battlefield (July 18, 1837). At the end of the Carlist war he established a centre of conspiracy at Malta, endeavoured to dissuade Mazzini from the Bandiera enterprise, but aided Crispi in organizing the Sicilian

revolution of 1848. He took part in the defence of Venice and of San Pancrazio. Upon the fall of Rome he returned to Malta, accumulating arms and stores, which he conveyed to Sicily, after having, in 1859, worked with Crispi to prepare the Sicilian revolution of 1860. While Garibaldi was sailing from Genoa towards Marsala Fabrizi landed at Pizzolo, and, after severe fighting, joined Garibaldi at Palermo. Under the Garibaldian dictatorship he was appointed governor of Messina and minister of war. Returning to Malta after the Neapolitan plebiscite, which he had vainly endeavoured to postpone, he was recalled to aid Cialdini in suppressing brigandage. While on his way to Sicily in 1862, to induce Garibaldi to give up the Aspromonte enterprise, he was arrested at Naples by Lamarmora. During the war of 1866 he became Garibaldi's chief of staff, and in 1867 fought at Mentana. In parliament he endeavoured to promote agreement between the chiefs of the Left, and from 1878 onwards worked to secure the return of Crispi to power, but died on March 31, 1885, two years before the realization of his object. His life was characterized by ardent patriotism and unimpeachable integrity. (H. W. S.)

FABROT, CHARLES ANNIBAL (1580–1659), French juriconsult, was born at Aix in Provence on Sept. 15, 1580. He translated the *Basilica* (1647, 7 vols.) and edited the works of Cujas. He died at Paris on Jan. 16, 1659.

FABYAN, ROBERT (d. 1513), English chronicler, belonged to an Essex family, members of which had been connected with trade in London. He married Elizabeth Pake, by whom he had a large family. He was a member of the Drapers' Company, and served as sheriff in 1493–94. In 1496 he was one of those appointed to make representations to the king on the new impositions on English cloth in Flanders. Next year he was one of the aldermen employed in keeping watch at the time of the Cornish rebellion. He resigned his aldermanry in 1502, and spent his latter years on his estate in Essex. He died on Feb. 28, 1513.

Fabyan's Chronicle was first published by Richard Pynson in 1516 as *The new chronicles of England and of France*. In this edition it ends with the reign of Richard III., and this probably represents the work as Fabyan left it, though with the omission of an autobiographical note and some religious verses, which are first found in the second edition, printed by John Rastell in 1533 with continuations down to 1509. A third edition appeared in 1542, and a fourth in 1559 with additions to that year. The only modern edition is that of Sir Henry Ellis, 1811. There is evidence that Fabyan had continued his Chronicle to 1511, but no trace of the manuscript can now be found.

Fabyan's own merits are little more than those of an industrious compiler, who strung together the accounts of his different authorities without any critical capacity. Nevertheless he deserves the praise which he has received as an early worker, and for having made public information which through Hall and Holinshed has become the common property of later historians, and has only recently been otherwise accessible. Bale alleges that the first edition was burnt by order of Cardinal Wolsey because it reflected on the wealth of the clergy; this probably refers to his version of the Lollards bill of 1410, which Fabyan extracted from one of the London Chronicles.

See further Ellis' *Introduction*; W. Busch, *England under the Tudors* (trans. A. M. Todd, 1895), i. 405–410; and C. L. Kingsford, *Chronicles of London*, pp. xxvi–xxxii. (1905).

FAÇADE, an architectural term signifying the external face of a building, especially applied to the principal front.

FACCIOLATI, JACOPO (1682–1769), Italian philologist, was born at Torriglia, near Padua, on Jan. 4, 1682. As professor of logic, and regent of the schools, Facciolati was the ornament of the Paduan university for 45 years. His *magnum opus* is the *Totius Latinitatis Lexicon*, which was ultimately published at Cardinal Priole's expense, 4 vols. fol., Padua, 1771 (revised ed. by de Vit, 1858–87). In the compilation of this work the chief burden seems to have been borne by Facciolati's pupil Forcellini. It has been said that the whole body of Latinity, if it were to perish, might be restored from this lexicon. In 1808 a volume containing nine of his *Epistles* was issued at Padua.

See J. E. Sandys, *Hist. Class. Schol.* ii. (1908).

FACE, a word used as noun or verb whose various meanings of surface, front, expression of countenance, look or appearance, are derived from its application to the exterior of the front of the head, from the top of the forehead to the point of the chin, and from ear to ear (see *ANATOMY: Superficial and Artistic*; and *PHYSIOGNOMY*).

FACE CREAMS are the basis of most modern systems of caring for the skin. Normally, the oil glands which lie in the lower layers of the skin secrete a natural lubricant which escapes from the thousands of pores and spreads out over the surface. Its purpose is to keep the skin smooth and soft, supple and waterproof. However, the conditions of modern life—faulty diet, lack of exercise, living in super-heated houses surrounded by excessively dry air—serve to upset the functioning of the skin's lubricating system. Dry skin and early fine lines resulting from this parched condition are characteristic of the skin of this era. To counteract this dryness, specialists recommend face creams, whose purpose it is to supply the lack of natural lubricant in the skin. These creams are to be applied by means of massage. They soften the horny surface layer of the skin, and render the skin smooth and supple. There is much discussion between dermatologists and beauty specialists as to whether or not the skin cells actually assimilate these creams presented externally. But their use does improve the appearance of the skin and prevent and correct fine lines and wrinkles, and so the discussion may be left in the realm of science. The thousands of advertised face creams fall into several general classes.

A *cleansing cream* is generally a cream of very light consistency, containing no waxy ingredients. It is intended to be used as a cleansing agent for the face and neck (to supplement, or supplant, the use of soap and water on the face). This should be a cream which melts at skin temperature, so that it can be smoothed easily over the skin. It should pick up dust, powder and impurities on the skin, without the necessity of deep massage movements. It should be made of oils which are not readily absorbed by the skin; otherwise the impurities might be absorbed with the cream. A cleansing cream softens and removes heavier grease on the skin and melts down impurities which clog the pores.

A *massage cream* is variously named a "tissue cream," "muscle-building cream," "skin food," "face moulding cream," by the several makers of creams of this type. It is a heavier cream than the cleansing cream; it is designed as a medium for massaging, patting, moulding and manipulating the muscles to increase circulation in the face and neck. It is made of oils which are absorbed by the skin, for its purpose is to round out the tissues and prevent or correct wrinkles. Cosmetic specialists disagree as to the relative merits of mineral, vegetable and animal fats as ingredients for supplying the needs of the skin. Vegetable and animal fats may perhaps be absorbed more readily, but they have the disadvantage of turning rancid if left on the skin for several hours (as over night), and releasing fatty acids in the pores which pave the way for pimples and other skin infections.

A *vanishing cream* is a cream which literally vanishes as it is smoothed on the skin. It has generally a soap base. It smooths out rough patches and leaves a soft bloom which makes a becoming and lasting base for powder and make-up. Its use prevents rouge from entering the pores. There are, in addition, other types of cream represented on the market. A "rolling cream" is made of casein base. "Astringent creams" are designed for their refining action on the pores. Many liquid creams are actually creamy lotions containing glycerine, gum tragacanth, benzoin or other emollients. (D. Co.)

FACE VALUE. Term describing the nominal value borne upon the face of stock or share certificates, loans, debentures, bank-notes, etc., indicating the value at which they are issued, or par value. The real or market value may be very different from the face value; if higher, a premium is said to exist; if lower, the security or sum thus stated in the face value is then at a discount.

FACILITATION, a term used in neurology to designate the favourable influence exerted over a conduction path by the passage of an impulse having an identical end-effect with the impulse

favoured. This facilitation of one nerve impulse by another may be successive or simultaneous. Activation of any reflex path leaves that path in a more favourable "set" for subsequent repetitions of the same response. Subliminal stimuli, simultaneously applied, may facilitate one another sufficiently to produce an overt response, if these impulses are allied in a final common path. Facilitation probably occurs at the synapse. The facilitating influence exercised by one impulse on another is generally known as "bahnung."

See C. S. Sherrington, *Integrative Action of the Nervous System*.

FACING BRICK: see BRICK.

FACTION, a term commonly employed, especially in the 18th century, to denote a group of partisans who set the aims of themselves and their party before the public welfare. It bears a more technical sense in Roman and Byzantine history, there denoting the factions of the circus and hippodrome which played a prominent part in politics both at Rome and Constantinople. The *factiones* were properly the four companies into which the charioteers were divided, and were distinguished by the colours they wore. Originally at Rome there were only two, white (*albata*) and red (*russata*), when each race was open to two chariots only; on the increase to four, the green (*prasina*) and blue (*veneta*) were added. At Constantinople the last two absorbed the red and white factions.

See Gibbon, *Decline and Fall*, ch. xl.; and J. B. Bury's *Appendix* 10 in vol. iv. of his edition (1898), for a discussion of the relationship between the *factiones* and the demes of Constantinople.

FACTOR, strictly "one who makes;" thus in ordinary parlance, anything which goes to the composition of anything else is termed one of its "factors," and in mathematics the term is used of those quantities which, when multiplied together, produce a given product. In a special sense, however—and that to which this article is devoted—"factor" is the name given to a mercantile agent (of the class known as "general agents") employed to buy or sell goods for a commission. When employed to sell, the possession of the goods is entrusted to him by his principal, and when employed to buy it is his duty to obtain possession of the goods and to consign them to his principal. In this he differs from a *broker* (*q.v.*), who has not such possession, and it is this distinguishing characteristic which gave rise in England to the series of statutes known as the Factors Acts. By these acts, consolidated and extended by the act of 1889, third parties buying or taking pledges from factors are protected as if the factor were in reality owner; but these enactments have in no way affected the contractual relations between the factor and his employer, and it will be convenient to define them before discussing the position of third parties as affected by the act.

FACTOR AND PRINCIPAL

A factor may be appointed or he may be dismissed in the same way as any other agent. He may be employed for a single transaction or to transact all his principal's business of a certain class during a limited period or till such time as his authority may be determined. It does not matter that a factor carries on a separate business on his own account, either of the same kind as that in which he is employed as factor, or of some other kind. A factor's duty is to sell or buy as directed; to carry out with care, skill and good faith any instructions he may receive; to receive or make payment; to keep accounts and to render them to his principal regularly, or when requested to do so, and to hand over to his principal the balance standing to his principal's credit, without any deduction save for commission and expenses. A factor is bound to account for any moneys he receives for his principal, and if between receiving it and paying it over, the money is lost (as for instance if the factor deposited it with a banker who became insolvent), the loss must be borne by the factor. All express instructions he must carry out to the full, and generally speaking literally, provided they do not involve fraud or illegality, but under circumstances of emergency he may deviate from his instructions (as for instance when goods are perishing) and if in so doing he exercises reasonable and proper skill and care he will not be liable for any loss there may

ensue. Where he is not given any express instructions, or on any point not covered by these, he must act bona fide and to the best of his skill and judgment, and he is bound to follow the usual practice of his particular business and any usages of the trade which may exist, if not inconsistent with his instructions or his position as factor, or unless, to a man of ordinary prudence, it would be manifestly disadvantageous to his employer's interests to do so. Many usages of businesses in which factors are employed have been proved in court, and may now be regarded as legally established. For instance, he may, unless otherwise directed, sell in his own name, and (apart from any express limit) at such price as to the best of his judgment he thinks proper, give warranties as to goods sold by him, sell by sample (in most businesses), give such credit as is usual in his business, receive payment in cash or as customary, and give receipts in full discharge, sell by indorsement of bills of lading, and insure the goods. He is not bound to insure goods unless to do so is according to the course of business with his principal. If he does effect an insurance he must see that all necessary risks are covered, satisfy himself as to the solvency of the underwriters, and disclose to them all material facts relating to the risk to be undertaken by them. It is his duty to clear the goods at the customs, take charge of them and keep them as safely as reasonable care and diligence will permit; give such notices to his principal and others as may be required, and in particular give punctual notice to his principal of all matters by which the rights or interests of the principal may be affected, as for instance the insolvency of a customer, or failure to effect an insurance, and if necessary take legal proceedings for the protection of the goods. On the other hand, he has not authority to delegate his employment, unless by usage of the trade or by express permission, or to barter, or to accept or negotiate bills of exchange except by authority of his principal and as between himself and his principal he has no right to pledge the goods, although as between the principal and the pledgee, an unauthorized pledge made by the factor may by virtue of the Factors Act 1889 be binding upon the principal. In the same way a factor has of course no right as between himself and his principal to sell goods in contravention of his principal's instructions, although as between his principal and the purchaser the sale may be binding upon the principal. It is, moreover, inconsistent with the factor's employment as agent that he should buy or sell on his own account from or to his principal.

On the due performance of his duties the factor is entitled to his commission, which is usually a percentage on the value of the goods sold or bought by him on account of his principal, regulated in amount by the usages of each business or by express agreement. Failing that, or any usage in the trade, the factor is entitled to a "reasonable" sum as commission. Sometimes the factor makes himself personally responsible for the solvency of the persons with whom he deals, in order that his principal may avoid the risk entailed by the usual trade credit. In such a case the factor is said to be employed on *del credere* terms, and is entitled to a higher rate of commission, usually $2\frac{1}{2}\%$ extra. Such an arrangement is not a contract of guarantee within the Statute of Frauds, and therefore need not be in writing. Besides his remuneration, the factor is entitled to be reimbursed by his principal for any expenses, and to be indemnified against any liabilities which he may have properly incurred in the execution of his principal's instructions. He cannot as a rule recover for any expenditure which is not expressly or impliedly covered by his instructions but he may do so in case of emergency if it is reasonable and in his employer's interests. For the purpose of enforcing his rights a factor has, without legal proceedings, two remedies. First, by virtue of his general *lien* (*q.v.*) he may hold any of his principal's goods which come lawfully to his hands in the course of his agency as security for the payment to him of any commission, out-of-pocket expenses, or even general balance of account in his favour, and in virtue of his particular lien he may hold any particular chattel in respect of which he has incurred expense. He may not sell the goods unless they have been entrusted to him for sale, in which case he may sell and claim a lien on the price. He can pledge the goods to the extent of his lien but no further,

and exercise a lien on the money so raised, and by virtue of the Factors Acts the principal will not be able to recover the goods from the pawnbroker except by discharging the advance made by him. The lien is lost if the goods are improperly sold or pledged, or the possession of them is parted with, or the factor takes security from his principal for the debt, or enters into any special arrangement with him, such as to give him credit. Secondly, when by contracting in his own name he has rendered himself personally liable to pay for goods he has bought for his principal, and where he has consigned goods to his principal but not been paid, he may "*stop in transit*" subject to the same rules of law as an ordinary vendor; that is to say, he must exercise his right before the transit ends; and his right may be defeated by his principal transferring the document of title to the goods to some third person, who takes it in good faith and for valuable consideration (Factors Act 1889, and Sale of Goods Act 1893, s. 47). If the factor does not carry out his principal's instructions, or carries them out so negligently or unskillfully that his principal gets no benefit thereby, the factor loses his commission and his right to reimbursement and indemnity. If by such failure or negligence the principal suffers any loss, the latter may recover it as damages. So too if the factor fails to render proper accounts his principal may by proper legal proceedings obtain an account and payment of what is found due; and threatened breaches of duty may be summarily stopped by an injunction. "An action will of course lie against a *del credere* agent for the price of goods sold to a purchaser who has failed to make payment." Criminal acts by the factor in relation to his principal's goods are dealt with by ss. 20 and 22 of the Larceny Act 1916.

PRINCIPAL AND THIRD PARTY

The rights of a third party as regards the power of a factor to bind his principal have been well-established at common law and amplified in the provisions of a special act.

(a) *At Common Law.*—The actual authority of a factor is defined by the same limits as his duty, the nature of which has been described; *i.e.*, firstly, by his principal's express instructions; secondly, by the rules of law and usages of trade, in view of which those instructions were expressed. But his power to bind his principal as regards third parties is often wider than his actual authority; for it would not be reasonable that third parties should be prejudiced by secret instructions, given in derogation of the authority ordinarily conferred by the custom of trade; and, as regards them, the factor is said to have "*apparent*" or "*ostensible*" authority, or to be *held out* as having authority to do what is customary, even though he may in fact have been expressly forbidden so to do by his principal. But this rule is subject to the proviso that if the third party have notice of the factor's actual instructions, the "apparent" authority will not be greater than the actual. "The general principle of law," said Lord Blackburn in the case of *Cole v. North-Western Bank*, 1875, L.R. 10, C.P. 363, "is that when the true owner has clothed any one with apparent authority to act as his agent, he is bound to those who deal with the agent on the assumption that he really is an agent with that authority, to the same extent as if the apparent authority were real." Under such circumstances the principal is for reasons of common fairness precluded, or, in legal phraseology, *estopped*, from denying his agent's authority. On the same principle of estoppel, but not by reason of any trade usages, a course of dealing which has been followed between a factor and a third party with the assent of the principal will give the factor apparent authority to continue dealing on the same terms even after the principal's assent has been withdrawn; provided that the third party has no notice of the withdrawal.

Such apparent authority binds the principal both as to acts done in excess of the actual authority and also when the actual authority has entirely ceased. For instance, A. B. receives goods from C. D. with instructions not to sell below 1s. per lb.; A. B. sells at 10½d., the market price; the buyer is entitled to the goods at 10½d., because A. B. had apparent authority, although he exceeded his actual authority. On the same principle the buyer would get a good title by buying from A. B. goods entrusted to

him by C. D., even though at the time of the sale C. D. had revoked A. B.'s authority and instructed him not to sell at all. In either case the factor is held out as having authority to sell, and the principal cannot afterwards turn round and say that his factor had no such authority. As in the course of his business the factor must necessarily make representations preliminary to the contracts into which he enters, so the principal will be bound by any such representations as may be within the factor's actual or apparent authority to the same degree as by the factor's contracts.

(b) *Under the Factors Act, 1889.*—The main object of the Factors Acts, in so far as they relate to transactions carried out by factors, has been to add to the number of cases in which third parties honestly buying or lending money on the security of goods may get a good title from persons in whose possession the goods are with the consent, actual or apparent, of the real owners, thus calling in aid the principle of French law that "*possession vaut titre*" as against the doctrine of the English common law that "*nemo dat quod non habet*." As regards sales by factors and the title which purchasers thereby acquire against the principal, the Factors Acts are mainly declaratory of the common law as stated above, but with this difference, that whereas at common law it was always an open question of fact to be determined by the court whether the principal had in truth held out his agent as having authority to effect the sale, the effect of the Factors Acts is that the principal is *deemed* to have authorized the agent by the fact of entrusting him with the goods. Under the act of 1889 it can be put even higher, and the agent is deemed to have authority by the mere fact of having the goods in his possession with the owner's consent, although there is no evidence of the owner having actually 'entrusted' them to him; the owner's 'consent' being presumed in the absence of evidence to the contrary. (*Oppenheimer v. Attenborough*, 1908, 1 K.B. 221, C.A.; *Oppenheimer v. Frazer and Wyatt*, 1907, 2 K.B. 50, C.A.) The chief change, however, in the law relating specially to factors has been to put pledges by factors on the same footing as sales, so as to bind a principal to third parties by his factor's pledge as by his factor's sale. The Factors Act 1889 in part re-enacts and in part extends the provisions of the earlier acts of 1823, 1825, 1842 and 1877. Its most important provisions concerning sales, pledges and other dispositions by factors are as follows:—

Section II., s.s. 1. Where a mercantile agent is, with the consent of the owner, in possession of goods or of the documents or title to goods, any sale, pledge or other disposition of the goods made by him when acting in the ordinary course of business of a mercantile agent shall, subject to the provisions of this act, be as valid as if he were expressly authorized by the owner of the goods to make the same; provided that the person taking under the disposition acts in good faith, and has not at the time of the disposition notice that the person making the disposition has not authority to make the same.

2. Where a mercantile agent has, with the consent of the owner, been in possession of goods or of the documents of title to goods, any sale, pledge or other disposition which would have been valid if the consent had continued shall be valid notwithstanding the determination of the consent; provided that the person taking under the disposition has not at the time thereof notice that the consent has been determined.

With regard to these provisions the following points should be noticed: (i.) the term 'notice' is stated by Chalmers (*Sale of Goods Act*, 10th ed. p. 166) to mean probably 'actual though not formal notice: that is to say, either knowledge of the facts or a suspicion of something wrong, combined with a wilful disregard of the means of knowledge.' The onus of proving good faith and want of notice is on the purchaser of the goods. (ii.) The 'consent' of the owner to the factor's possession of the goods is to be presumed in the absence of evidence to the contrary (s. 2, s.s. 4 of the Factors Act 1889). (iii.) Although the Factors Act may operate to make an unauthorized sale or pledge by a factor good as between principal and third party, nothing in the act makes such a sale or pledge good as between principal and factor, or operates to exempt the factor from civil or criminal liability

(s. 12, s.s. 1 of the Factors Act 1889). (iv.) In order that s. 2, s.s. 1 and 2 of the Factors Act 1889 (quoted above) may apply, and a sale pledge or other disposition by the factor be good as between principal and third party, it is necessary that the goods should have been in the possession of the factor *in his capacity as such*, and not in some other capacity. If, for instance, a factor also carries on business as a warehouseman, and goods are entrusted to him not in his capacity as factor, but in his capacity as warehouseman, and solely to be warehoused, any disposition of the goods by him will not be covered by the Factors Act.

Enforcement of Contracts.—1. Where a factor makes a contract in the name of his principal and himself signs as agent only, he drops out as soon as the contract is made, and the principal and third party alone can sue or be sued upon it. As factors usually contract in their own name this is not a common case. It is characteristic of brokers rather than of factors.

2. Where a factor makes a contract for the principal without disclosing his principal's name, the third party may, on discovering the principal, elect whether he will treat the factor or his principal as the party to the contract; provided that if the factor contract expressly as factor, so as to exclude the idea that he is personally responsible, he will not be liable. The principal may sue upon the contract, so also may the factor, unless the principal first intervene.

3. Where a factor makes a contract in his own name without disclosing the existence of his principal, the third party may, on discovering the existence of the principal, elect whether he will sue the factor or the principal. Either principal or factor may sue the third party upon the contract. But if the factor has been permitted by the principal to hold himself out as the principal, and the person dealing with the factor has believed that the factor was the principal and has acted on that belief before ascertaining his mistake, then in an action by the principal the third party may set up any defences he would have had against the factor if the factor had brought the action on his own account as principal.

4. Where a factor has a lien upon the goods and their proceeds for advances made to the principal it will be no defence to an action by him for the third party to plead that he has paid the principal, unless the factor by his conduct led the third party to believe that he agreed to a settlement being made with his principal.

5. The factor who acts for a foreign principal will always be personally liable unless it is clear that the third party has agreed to look only to the principal, and equally the factor may always sue on the contract.

6. If a factor contract by deed under seal, or draws, accepts, or indorses a bill of exchange or promissory note, he alone can sue or be sued upon the contract. (L. Sc.)

Blackwell, *The Law relating to Factors* (1897); also Mechem, *Agency* (2d ed., 1914); Williston, *Sales* (2d ed., 1924); Weld, *Marketing of Farm Products* (1914).

United States.—In only a few particulars does the American law differ from the English as set forth above, notably in regard to the Factors Act 1889. About eight American States—chiefly on the seaboard—have Factors Acts, and those Acts are hardly so far-reaching in their effects as the English, so that in general it is not law in the United States that a factor can effectively pledge his principal's goods—beyond the extent of his own interest by virtue of advances made to his principal—to secure his own debts. There is, however, an important qualification of the rule, derived from the widespread adoption of the uniform commercial Acts. Under the Sales Act (27 States) and in some additional States, without that Act, the factor (or any other person to whom an owner has entrusted a bill of lading running to order, and properly endorsed) can effectively pledge or sell the document, and so the goods represented by the document, although he does so in breach of duty; and under the Federal Bills of Lading Act the rule holds as well for all order bills of lading arising out of inter-State shipments. Moreover, under the Warehouse Receipts Act (45

States), the same holds as to goods covered by warehouse receipts running to order. This is not true of documents which lack the word "order" or "negotiable," nor as to transactions involving goods in specie; but since most (not all) such attempted pledges involve such order documents, the old rule has been very substantially impaired.

The factor appears in the United States chiefly under the commercial designation "commission man"; goods sent to a factor, large or small, are commonly said to be shipped "on consignment," as distinguished from shipment pursuant to a contract for sale. In the main, such a commission man is a feature of a central market, to which sellers, especially of raw materials, are shipping: so especially agricultural produce such as fruits and vegetables, or cotton, coffee, live stock, etc. Factorage here serves as an alternative to the middle man who goes about among growers buying up their produce in advance. Both ways of dealing presuppose a seller who is relatively weak financially; hence the importance of factors' advances to their principals, and of factors' liens.

It should be noted that wherever the factor attains great financial power—as, in the United States, particularly in some phases of importing and in the merchandising of textiles—he tends to develop into a peculiar and specialized type of commercial (and even investment) banker, whose loans are limited to the one specific field in which he is skilled; whose earnings include commissions on his own selling of the merchandise delivered to him as security; and whose banking assets are not recruited by deposits, so as to subject him to State control.

Along another line the factor, being located in a central market and becoming skilled in its operations, tends to branch out into independent trading—as do similarly situated brokers. Hence at times a conflict of interest between himself and his principals, as to whose goods shall get sold on a falling or fluctuating market; hence also some of those financial involvements which raise the question of how far the factor has power to pledge away his principal's goods; hence, finally, occasional legislation aimed at control of the commission man's business in the interest of his principals.

(K. N. L.)

FACTORS OF PRODUCTION. In economics, the four factors which together are necessary to the production of wealth. These are land, capital, labour and organisation (*see AGENTS OF PRODUCTION*).

FACTORY ACTS: *see* LABOUR LAW.

FACTORY CONSTRUCTION AND PLANNING.

The selection of the site and the design of factory buildings are vital economic factors in manufacture, as they contribute seriously to the cost of production, not only on account of the initial outlay of capital required, but because of their influence on efficient production. The elimination of waste, whether of material, time or effort, is the chief feature of all manufacturing, and the design of factory buildings plays its part in this elimination.

The haphazard methods of erecting factory buildings are passing, and more systematic consideration is being given to their planning and erection, though even at the present time more effort is devoted to providing good machinery than good, suitable buildings. The factors most largely influencing the design of factory buildings are large scale and standardized production; factory legislation, both government and local; building by-laws; insurance conditions and the welfare of the employees.

Regarding the actual design and building of factories, the determining factor is naturally the character of the product, but certain general considerations apply whatever the product. The architect of every new factory should make himself thoroughly familiar with the processes and products of the factory before attempting his design, which should be made with a view to meeting adequately the future needs of the industry which, under favourable conditions, will naturally expand, especially as the present-day tendency is towards amalgamations and the formation of large corporations. One of the best ways of providing for this contingency is to design all buildings on the principle of suitable standardized units which can be increased as necessity arises. These standardized units should represent a complete organization, but should be so arranged as to make future extensions pos-

sible without interfering with the existing business.

Selection of Site.—The effect of location is common to all factory design, and in selecting a site all the following should be taken into account:—

Nearness to raw material supply is an important factor where raw materials are bulky and cheap, but as the bulk decreases and the value increases this factor becomes less important. It is necessary to study the convenience of existing railway lines, freightage, etc. Proximity to a canal is not the important feature it was formerly. The contour of the land should be studied, not only in so far as it presents a suitably level site for building purposes, but also in relation to canals, railways and other means of transport.

The supplies of electricity, gas and water are all important considerations, especially where, as in the case of some industries, enormous quantities of any one are needed, as, for example, in the pulp and paper industry, which requires a vast amount of water; or where the cost of power represents a large part of the ultimate cost of the product. The climate is an important factor in certain industries, as, for example, in the textile industry, where a humid atmosphere is necessary; though in this case it is becoming less important than formerly because the humidity can be controlled artificially.

Suitable Labour Supply.—Where the necessary labour supply is of the unskilled type this is not an important factor, but where skilled labour is essential it is necessary to locate the industry in a district where training and heredity have developed the required type. Skilled labour is not so migratory as unskilled on account of social and family attachments, etc.

Room for Expansion.—It would, of course, be futile to place a factory in a crowded and congested area where there is no space for expansion. The present tendency is for factories to be built on the outskirts of existing industrial areas because here (providing transport facilities are satisfactory, which is not always the case) land is usually cheaper, taxation lower and working conditions better than in the towns. It is, however, difficult to induce labour that is accustomed to town life to migrate to country districts and this, coupled with the housing question (*see HOUSING*), may be an important factor operating against an otherwise ideal site. Further, some industries may be dangerous or offensive and these must be located well away from congested areas.

Other Factors.—Capital available for investment, laws affecting the tenancy of land, sewage, floods, drinking water supply, etc., are all important points to consider in the selection of a site.

Types of Factory Building.—The type of building erected for a factory depends entirely on the product to be manufactured, and the architectural form is dominated by this factor, and, in the majority of cases, by the great need for economy; but an attractive looking plant has a marked effect on employees, and has an advertising value.

Main Types.—There are, in general, three main types of factory building:—

1. The single story building of the weaving-shed type, having a saw-toothed roof consisting of a series of unequally inclined ridges, glazed usually only on the north side, which permits of uniform lighting without shadows. In the single story type when the site does not permit of north lighting, the ridges, which must be equally inclined, can be glazed on both sides. This type is not well adapted for overhead shafting, cranes, etc.

2. The one-story building with large truss spans, provided with accommodation for travelling cranes, etc. This is the foundry, forge and machine shop type and is suitable for medium and heavy work.

3. Multi-story buildings for all kinds of manufacture and storage, except in the case of the heaviest industries.

Naturally, each type has its advantages and disadvantages and must be considered in relation to the product of the factory; but generally, when cost of land is not prohibitive and the product is bulky, the natural choice would be towards a one-story building. Each of these three types of building permits of a construction of any one of the following kinds:—

(a) Timber and masonry, known as "Mill construction."

- (b) Steel framework.
- (c) Reinforced concrete.

Whatever type of construction is employed, the predominating necessity is "fireproofness." In the event of a fire, although the actual amount of material damage is recoverable by insurance, the loss through disorganization is not recoverable, and frequently is so overwhelming as to prevent ultimate reorganization.

Mill Construction.—Mill construction is of various types, but in the main, the outside walls are of masonry, the floors of wood, and the roofs, posts, joists and girders of wood or metal. Where much timber is involved the great disadvantage of this type, which for other than heavy work is in other respects satisfactory, is that for fire-resisting purposes it cannot be recommended. This type of building is seldom used for heights of more than six floors on account of its lack of lateral stability, which is chiefly dependent on the masonry of the walls, and which, if developed to any height, would require to be supported by excessive-sized pillars and increased thickness in the lower stories. The adoption of this type of building is getting less and less.

Steel Framework.—Buildings of this type were made possible by the introduction of the Bessemer process of steel manufacture. Here rolled steel structural members are used and filled in with walls, floor and roof, etc. The steel members are riveted or bolted together. Where long spans without support are necessary, steel framework is essential, and it is also necessary in the case of high walls exposed to wind pressure and to the lateral forces of moving cranes. Steel framework buildings are not fireproof because exposed steelwork twists and buckles when subject to intense heat, thus wrecking the building more quickly than the fire itself. If the structural steel framework is encased in fire-resisting material such as concrete, it is admirably suitable for the interior of a factory (see FERRO-CONCRETE).

Reinforced Concrete.—Buildings of this material have come to be recognized as one of the standard types for industry. The material is classed as "fireproof" and will stand the destructive effects of fire as well as any material. It is not usually damaged beyond repair by fire, and seldom, if ever, destroyed. It is a particularly durable material, and its durability improves with age. It is particularly well suited for multi-story buildings containing vibrating machinery or machines with heavy reciprocating parts. "Daylight factories" giving the maximum of natural lighting have come into vogue with reinforced concrete because columns or pillars may be more slender and the steel framework windows which are used give an increased lighting area. In cases where the floor load is higher than 200 lb. per sq.ft., reinforced concrete buildings are cheaper than those of mill construction.

Reinforced concrete buildings have developed almost entirely since 1910. The first line of development was along the form of beam and girder construction, but now the flat slab method of flooring is used, especially in cases where the live load is 150 lb. or more per square foot. For lighter loads, the development has been towards the long span joist construction with a filler of metal, tile, terra-cotta or gypsum block, which reduces dead load and saves concrete.

Details of Construction.—Foundations.—In choosing a site an important point is that of levels, and a site poor in this respect purchased at a low figure may eventually prove a most costly one. It is also important to have full knowledge of any mineral workings going on, or likely to go on, as these might cause subsidence. The foundations of buildings which are to house heavy machinery must be ample enough to absorb vibration, and in the case of such implements as the steam and power hammer, or jarring machinery for foundries, the foundations should be entirely separate from all building structures or their foundations. It is important to choose a site where there exists a good subsoil of clay or rock, otherwise the expense of piling or rafting might make the cost of the buildings very high or even prohibitive.

Floors.—These should be designed to provide facilities for future changes, especially if they are of reinforced concrete, and ducts should be arranged to accommodate pipes, etc. Conduits should be properly placed and openings provided for belts, shafting and other accessories, properly protected. Where apparatus

must be taken through floors, ample openings and trap doors or removable floor slabs are essential. Floors formed of concrete and merely spade-finished are unsuitable, and their durability should be increased by some form of floor-hardener or by the application of paving. Pavings are of many kinds, metallic, granolithic, cemented, of fir boarding laid on battens, pitchpine boarding, brick-ing, maple boarding, rock asphalt, wood blocks, etc. Each of these types has its advantages and disadvantages, some being unsuitable on account of dust, others on account of the discomfort to workers, and every building requires separate consideration. Floor areas must be laid out so as to avoid the conflict of travel in opposite directions and to permit of easy transport.

Lighting.—Windows, while no more expensive in initial outlay than walls, are an expensive item in upkeep, and with a large area of glazing the size of glass forming a unit should be of the order of 1ft. 4in. by 2ft. or even larger, if of the roughcast or "prismatic" type. It is not usually essential that all parts should be made to open. Steel sashing, although difficult to clean and a source of lost heat, is preferable to wooden sashing as it provides increased lighting facilities, giving 80% to 90% light area as against 50% to 70% for wooden sashes and frames. One-story saw-toothed buildings should have roof windows facing north to avoid direct sunlight.

Walls.—The thickness of building walls is dictated by building acts and by-laws, and in most countries there is no possibility of erecting such walls of less thickness than 9in. or 14in. depending on the height and length of the wall and whether steel framework is used. As already stated in connection with the various types of building construction, various materials are used for walls such as brick, concrete, stone, etc. Where hoists and cranes are fitted these must be provided with ample support.

Roofs.—Roofs are one of the large items in building construction. Their particular form is dependent upon the intended purpose of the building; a high pitched gabled roof is the best for forges, foundries and other shops engaged in hot processes in which large quantities of heat require to be dissipated, and in other cases where a level ceiling is not required; the glazed saw-toothed form of roof provides the best condition of steady, uniform, natural lighting; the flat roof is the natural type for buildings with interior columns. Whatever the type the essential features are water- and fire-proofness. For general purposes the best material is mineral rock asphalt, which is unaffected by heat or cold and requires no yearly treatment, and is also capable of withstanding traffic without damage. Where sloping roofs are used, steel or reinforced concrete roof principals are employed, and this method of support is now as cheap as steel. Slates as a covering are high in first cost and heavy for long span roofs, but if of good quality are very durable. Bituminous felts and other compositions in sheet form are low in first cost, but require special treatment every few years.

Heating and Ventilation.—Of these two subjects the latter is the more important. In an ordinary factory the air should be changed three to five times per hour, while under some circumstances it should be changed as many as 20 times per hour. The temperature also varies with the nature of the work carried on, but a good average is 57° F, though for heavy manual labour a lower temperature should prevail, and for sedentary work, a higher. Various systems of ventilation and heating are employed, but the most suitable for the particular case must be selected, care being taken to economize space and avoid interference with cranes, conveyors, etc. (see PUBLIC HEALTH).

Stairways, Lifts, Elevators, etc.—Stairways should be ample for emergencies and give passengers the least inconvenience, a 6½in. rise being considered good practice. Lifts should be encased with brick walls to prevent the spread of fire, and the openings should be fitted with doors of fire-resisting material made to close automatically in case of fire.

Power Supplies.—Where power is generated on the site, the plant should be located at a point most convenient for the handling of fuel and ashes, and all boiler and engine-room equipment should be capable of extension. Where live steam is used in the manufacturing processes, the power plant should be situated cen-

trally in order to avoid the necessity of long lengths of piping and excessive loss of heat.

Fire Protection.—The installation of apparatus to deal with outbreaks of fire is a necessity in all industrial buildings. The most usual form is by the sprinkler system in which pipes are fixed horizontally along the ceiling, and supplied with water which is not released until the temperature in the building is sufficiently high to melt the solder which holds the automatic valve of the sprinklers in position. When this is released the water is discharged over the affected area. Where sprinklers are not used, hydrants with lengths of hose should be fixed near stairs and in easily accessible positions and fire buckets and chemical fire extinguishers should be placed within the reach of anyone in the building. In the case of some trades, buckets of sand are more useful than water. Lightning-conductors should be fixed to all buildings. (See also INDUSTRIAL ARCHITECTURE.)

FACTORY INSPECTION. In Great Britain, the duties of the factory inspectors consist broadly in the enforcement of the Factory and Workshop Acts, Truck Acts (in factories and workshops), and the Lead Paint (Protection against Poisoning) Act, 1926, and may be grouped under the following main heads:—

Sanitation.—The inspectors see that all factories are kept clean, are properly ventilated and not overcrowded, and that a reasonable temperature is maintained in each workroom. The local sanitary authorities are primarily responsible for these duties in workshops, but there is close co-operation between them and the Factory Department; the inspectors report all irregularities observed during their inspections, while the local authorities advise the inspectors of workshops they discover where the prescribed Abstract of the Factory and Workshop Acts is not affixed.

Sufficient and suitable sanitary conveniences must be provided, with separate accommodation for each sex, in all areas. This requirement is directly enforceable by the inspectors both in factories and workshops, except in the administrative county of London, or in any place where Part III. of the Public Health Act (Amendment Act), 1890, is in force. As both the Public Health (London) Act, 1891, and the Public Health Act (Amendment Act), 1890, impose the same obligations, works in areas coming under those acts are excluded from the operation of the Factory and Workshop Act, but the factory inspectors co-operate by reporting to the local authorities any irregularities observed. In those parts of England and Wales where Part III. of the Public Health Act, 1890, is not in force and in Scotland the District Council may still deal with the matter under the Public Health Acts, subject to the observance of the standard of sufficiency and suitability determined by order of the secretary of State, but in these areas the duty of seeing that sufficient and suitable accommodation is provided and of administering the secretary of State's order rests primarily with the factory inspectors. At the same time, the inspectors inform the District Council of any instructions issued to occupiers, in order that the council may have the opportunity of enforcing simultaneously any additional conditions under the Public Health Acts which they think desirable. Thus full co-operation is secured.

Safety.—All machinery is inspected to see that a proper standard of fencing is maintained. Though no definite standards are laid down in the act, regulations have been made in the more dangerous industries, specifying in detail the protection required. In other industries agreements have been reached at trade conferences between the department and employers and operatives as to the safeguards to be provided in those industries. Further, departmental instructions based on long experience, and partly also on High Court decisions, have resulted in the establishment of well recognized standards which enable the inspectors to secure uniformity of practice.

The inspectors receive notice of all accidents, investigate their cause, and advise as to measures for preventing a recurrence. They also assist the coroners at inquests. They are responsible for seeing that steam boilers are regularly examined, and reports obtained on the condition of the boiler and its mountings, specifying the maximum permissible working pressure. Another important duty is that of seeing that adequate means of escape in case of fire is provided and maintained. Though the local authorities are primarily responsible in this matter, the inspector must report to these authorities cases where, in his opinion, the means of escape is inadequate, and he must be informed of the action taken as a result of his complaint.

Besides enforcing the statutory requirement in regard to safety, the inspectors are constantly in touch with employers on the question of accident prevention generally. Many accidents arise from conditions and practices which cannot be controlled by legal enactments. The inspectors are thus called upon to take up the question of safety generally, and in particular they do all they can to encourage the modern movement towards the adoption of safety organization as a definite part of works management.

Employment.—The inspectors must see that the hours of employment of women and young persons are within the prescribed limits, both during normal hours and during such overtime or night work as is permissible and that proper meal times are allowed. They have to report on applications for permission to work on a system of two shifts, and to enforce the conditions attached to orders sanctioning this system of employment. They must see, too, in those trades to which this requirement of the act applies, that workers paid on a piece-work basis receive such particulars regarding the work to be done and the rate of wages to be paid as will enable them to calculate the wages earned. They are responsible for seeing that no fines or deductions are made from the wages in contravention of the Truck Acts.

Dangerous Trades.—Special duties arise in relation to trades certified as dangerous, either because of the special risk of injury to health from lead, anthrax and silicious and other injurious dusts, or because of the specially dangerous character of the work, as in building, shipbuilding, dock work, wood-working, the use of celluloid and the generation or use of electricity. For these trades special regulations are in operation dealing with such matters as exhaust ventilation, medical supervision, cleanliness, messroom and cloakroom accommodation for the first class, and with detailed measures of protection for the second. The inspectors not only enforce these regulations but take a leading part in their establishment by collecting information as to the best existing practice and by advising as to the requirements to be included in the code.

Welfare.—Similar to the dangerous trades regulations are the welfare orders made to secure the comfort and wellbeing of workers in industries where special welfare arrangements are needed. These deal with the provision of first-aid and ambulance arrangements where accidents are specially numerous; the provision of messrooms, cloakrooms, and lavatories in dirty or offensive trades; arrangements to secure cleanliness and first-aid treatment in industries such as fish-curing, baking, chrome dyeing and tanning, where the workers suffer from minor injuries through the materials used. These orders also are framed on reports from the inspectors and are enforced by them.

The department is under the control of the chief inspector, assisted by three deputy chief inspectors (one a woman). The country is divided into divisions, each under a superintending inspector, and each division is divided into districts, under district inspectors, to the more important of which junior and assistant inspectors are attached. Until 1921, the women inspectors were organized as a separate branch, but the two branches have since been amalgamated.

In 1928 the general staff was as follows:—10 superintending inspectors (one a woman) 86 inspectors Class I., 32 inspectors Class II., 7 women deputy superintending inspectors, 8 women district inspectors, 15 women inspectors, 1 senior inspector of particulars, 4 assistant inspectors of particulars, 23 inspectors' assistants.

With the development of industry and the increased attention paid to ventilation, engineering, medical and other problems, the work of the department has become much more technical. Separate technical branches have, therefore, been established. The medical branch consists of a senior medical inspector with four medical inspectors (one a woman) under him. The electrical branch, recently strengthened to cope with the rapid increase in the use of electricity, consists of one senior inspector with four inspectors under him. The engineering branch consists of a senior engineering inspector with a staff of five.

There are under the jurisdiction of the department some 270,000 factories, 8,000 docks, quays and warehouses, and many buildings in course of construction. Nearly 350,000 visits of inspection are paid every year. The position of the inspectors has, however, greatly changed in recent years. Whereas formerly they had to enforce an unpopular act and contend with all kinds of opposition, they have become more the advisers of the employers, who often consult them on all kinds of questions. They are, indeed, by virtue of their previous scientific, professional and technical training, added to their long and varied experience of the industries of the country, a body of industrial experts, whose services are at the disposal of industry to assist and advise. The value of their special industrial knowledge was amply shown during the World War when they were called upon to carry out many different kinds of war work, including such varied duties as inspection of steel for the Admiralty, service as superintending engineers and in the organization of welfare work at the Ministry of Munitions, assisting in recruiting and advising on substitution at the Ministry of National Service. (G. BEL.)

United States.—Inspection by the national Government applies to all Federal Government work places and to operations in inter-State commerce and to employments aboard vessels on navigable waters. Broad inspection powers are exercised by the U.S. Employees Compensation Commission, by the Shipping Commissioners and by Inter-State Commerce Committee representatives. Most industrial inspection in America is under authority of the 48 individual States, New York having 183 inspectors of whom 31 are women, visiting 66,000 factories and 100,000 mercantile establishments in addition to homes where factory work is carried on, places of public assembly and extensive construction enterprises. The New York Labor Department also administers accident compensation, thus unifying and giving special force to industrial safety and health inspections. The head is a commissioner with an industrial board of five members, the chairman of which is a woman. (J. B. A.)

FACTORY SYSTEM. The system under which modern industry is carried on is often spoken of as the "factory system," and contrasted with a preceding "domestic system," or system of household industry. This contrast is in fact true only in a very broad sense; for the name "domestic system" is by no means generally applicable to the forms of industrial organization before the great changes of the late 18th and early 19th centuries. There were many factories, usually small, and still more fairly large workshops in which the workers laboured under the eye of a master or his manager long before the days of the Industrial Revolution. The case of the famous Jack of Newbury (16th century) as an early factory owner is well known; and there were many others, the number of fairly large industrial establishments steadily increasing, even before the advent of steam power. The contrast between domestic and factory industry is indeed in the main a generalization drawn from the rapid transformation of the spinning and weaving trades in the late 18th and early 19th centuries under the stimulus of mechanical invention and the development of steam power. If these cautions are borne in mind, the factory system can be regarded as the typical organization of industry since the Industrial Revolution. Steam power is, indeed, the very basis of the factory economy as it has appeared in the modern world. Only with the coming of power-driven machinery and the power-house did it become an economic necessity in one manufacturing trade after another to collect the operatives together under the roof of the employer, and to insist on regular hours of labour and a regular discipline. Thereafter, increasingly,

the power-plant set the pace and governed the conditions of labour. Under the "domestic system," it mattered relatively little to the capitalist what hours, or with what intensity, the worker laboured. He was paid by the piece, and how much he produced in response to the piece-work incentive was in the main his own affair. But as soon as the factory, with its power-plant, had to earn its keep, the intensity and duration of labour became matters of direct economic concern to the employer. Hence the excessively long hours, and the barbarous speeding-up of the early days of the factory system, when it was not uncommon for children, as well as adults, to be worked as much as 14 hours a day. Similar conditions have to some extent reproduced themselves in the Eastern countries now in process of industrialization.

Rise of Trade Unions.—As the factory system spread, and the workers were collected into large masses in the new factory towns, trade unionism naturally arose among them, partly as the response to evil conditions, and partly as the expression of an instinctive desire for association. To a great extent, the factory system called trade unionism into being, supplementing the much older small trade clubs of the skilled artisans by the larger-scale combinations which arose, and won their way to toleration, in the earlier half of the 19th century in England, and later elsewhere, as the factory system developed in other countries. At first the typical factories were, by modern standards, small; but with the development of industrial technique they grew rapidly in size, and their organization was transformed. Increasingly, the limited company took the place of the personal employer; and working conditions came to be regulated by State intervention (Factory Acts of 1802, 1819, 1833, 1847, 1867 . . . to 1901, Mines Acts, Truck Acts, etc.), and by collective bargaining, as the employers, especially after the Trade Union Act of 1871, growingly recognized trade unions and entered into (unenforceable) collective agreements with them. To-day, save in a few surviving "sweated" trades, in which "home-work" still lingers, the factory system is practically universal in developed industrial countries, and is rapidly spreading in such countries as India and China. In the advanced countries its evils have been a good deal mitigated by trade union custom, and by industrial legislation; but in the more recently industrialized areas conditions are still very bad. One of the main functions of the International Labour Organization founded, as an integral part of the League of Nations, in 1919, is the regulation of factory conditions throughout the world by means of international conventions ratified and made effective by corresponding national legislation. But progress in this respect has been so far (1928) very slow.

Mess, *Factory Legislation and Administration* (1926); A. Redgrave, *The Factory Acts* (1891, 13th ed. 1924); F. Tillyard, *The Worker and the State* (1922); *Industrial Law* (1916). For early factory conditions, see the numerous Blue-books containing reports of enquiries during the early 19th century, and F. Engels, *The Condition of the Working Classes in England in 1844* (1892); and for modern conditions, the *Annual Reports* of the Chief Inspectors of Factories and the publications of the International Labour Organisation. (G. D. H. C.)

FACULA (diminutive of *fax*, Lat. for "torch"), in astronomy, a minute shining spot on the sun's disk, markedly brighter than the photosphere in general, usually appearing in groups. Faculae are most frequent in the neighbourhood of spots. (See SUN.)

FACULTY, power or capacity of mind or body, for particular kinds of activity, feeling, etc. In the early history of psychology the term was applied to various mental processes considered as causes or conditions of the mind—a treatment of class concepts of mental phenomena as if they were real forces producing these phenomena. In mediaeval Latin *facultas* was used to translate *δύναμις* in the Aristotelian application of the word to a branch of learning or knowledge, and thus it is particularly applied to the various departments of knowledge as taught in a university and to the body of teachers of the particular art or science taught and finally to the entire teaching body. A further extension of this use is to the body of members of any profession.

In law, "faculty" is a dispensation or licence to do that which

is not permitted by the common law. The word in this sense is used only in ecclesiastical law. (See *BENEFICE*; *MARRIAGE*; *LICENCE*; *NOTARY PUBLIC*.) Any alteration in a church, such as an addition or diminution in the fabric or the utensils or ornaments, cannot strictly be made without the legal sanction of the ordinary, which can be expressed only by the issue of a faculty. So a faculty would be required for a vault, for the removal of a body, for the purpose of erecting monuments, for alterations in a parsonage house, for brick graves, for the apportionment of a seat, etc. Cathedrals, however, are exempt. The court of faculties is the court of the archbishop for granting faculties. In Scotland the society of advocates of the court of session, and local bodies of legal practitioners, are described as faculties.

FACULTY PSYCHOLOGY is the name given to the older psychology which "explained" the various mental processes by reference to corresponding "faculties" (Latin *facultas*, a capacity) which exercised them. Thus the process of thinking was explained by reference to the faculty of "understanding" or of "reason," the process of volition was referred to the faculty of "will," and so on. Although the faculty psychology has been frequently derided from the days of Locke onwards, it is not entirely dead, for it still seems to haunt some of the latest books on psychology in the guise of "abilities."

FADING is the variation of the signal intensity received at a given location from a radio transmitting station as a result of changes in the transmission path.

FADNIA, a Guhayina sub-group, partly nomadic, partly sedentary, in the Sudan.

FAED, THOMAS (1826–1900), British painter, born in Kirkcudbrightshire, studied at the school of design, Edinburgh, was a member of the Royal Scottish Academy, and became R.A. in 1864. Three of his pictures, "The Silken Gown," "Faults on Both Sides" and "The Highland Mother," are in the National Gallery of British Art (Tate Gallery), London.

See William D. McKay, *The Scottish School of Painting* (1906).

FAENZA, a city and episcopal see of Emilia, Italy (anc. *Faventia*), province of Ravenna, 31 m. S.W. from the town of Ravenna by rail, 110 ft. above sea-level. It is 31 m. S.E. of Bologna by rail, on the line from Bologna to Rimini, and it is the junction of a line to Florence through the Apennines. Pop. (1921) 22,469 (town), 43,101 (commune). The town still preserves traces of the Roman rectangular plan, and is surrounded by walls which date from 1456. The cathedral of S. Pietro stands in the centre of the town. It was begun in 1474 by Giuliano da Maiano; the façade is, however, incomplete. In the interior is the beautiful early Renaissance tomb of S. Savinus with reliefs showing scenes from his life, by Benedetto da Maiano. Opposite the cathedral is a fountain with bronze ornamentation (1621). The municipal buildings have been restored; the picturesque arcades of the Palazzo del Comune date from the 15th century and those of the Palazzo del Podestà from the 18th. The municipal art gallery contains fine specimens of majolica, a variety of which, faience, takes its name from the town. It was largely manufactured in the 15th and 16th centuries, and the industry has been revived in modern times with success. See *CERAMICS*. There is an international museum here of ceramics with specimens of every date and country. The name Faventia is clearly Roman. The town lay on the Via Aemilia: here Papirius Carbo and C. Norbanus were defeated by Q. Caecilius Metellus Pius in 82 B.C. Pliny speaks of the whiteness of its linen, and the productiveness of its vines is mentioned. In 740 it was taken by Liutprand. Desiderius gave it to the church with the duchy of Ferrara. It was a free city at the beginning of the 12th century and at first took the imperial side, but in 1240 it stood a long siege from Frederick II. and was taken only after eight months. In 1313 the Manfredi made themselves masters of the place and remained in power until 1501, when the town was taken by Caesar Borgia.

FAEROE ISLANDS (also written FAROE or THE FAEROES, Danish *Færøerne* or *Farøerne*, "the sheep islands"), a group of islands in the north Atlantic ocean belonging to Denmark. They are situated between Iceland and the Shetland islands, about 200 m. N.W. of the latter, about 7° E. and 62° N. The total

land area of the group is 515 sq.m. and there are 21 islands (excluding small rocks and reefs), of which 17 are inhabited. Pop. (1925) 22,835. The principal islands are Strömö, Osterö, Süderö, Vaagö, Sandö and Bordö. The islands were formed by a series of submarine outpourings of basalt in Tertiary times. Together with the thin intercalated beds of tuff, they have a total thickness of 70 to 100 feet. The columnar structure of the basalt can be well seen in the islands of Süderö. Upon the basalt rests the so-called coal formation 35 to 50 ft. thick; the lower part of this is mainly fireclays and sandstone, and the upper is weathered clay with thin layers of shale and brown coal. The latter occurs, especially in Süderö, in sufficient quantities to be worth exploitation. Above this, over the greater part of the surface, lie beds of dolerite 15 to 20 ft. thick. All these beds lie practically horizontal. During the Glacial period the whole surface up to 1,500 ft. was covered by ice sheets, and the present relief is due mainly to the action of ice upon the horizontal beds. The islands are high and rugged, with perpendicular cliffs and flat summits separated by deep narrow ravines. The coasts are deeply indented and a series of fjords run from north-west to south-east. The narrow passages between the islands tend to follow the same direction and are made dangerous by very strong tidal currents. The coastal scenery is very fine, especially in the more westerly islands. The greatest height in the islands is Slättareindur in Osterö, 2,894 feet. There are several lakes in which trout is abundant, and char is also found; the largest is Sörvaag lake in Vaagö which discharges into the sea by a sheer fall of about 160 feet.

The climate is oceanic, with mild but stormy winters and cool summers. Rainfall is heavy and well distributed, the maximum occurring in autumn and winter. The sky is generally overcast, and fogs are frequent. There are seldom long periods of frost and the harbours are very rarely ice-bound. At midsummer the sun is above the horizon for about 19½ hours.

Owing to the strong westerly winds and frequent gales the islands are naturally treeless but there has been successful planting of hardy conifers, also maple and mountain ash. Much of the natural vegetation has been dwarfed by continuous grazing. Berry fruits flourish, and potatoes are one of the most successful crops, but the methods of agriculture are extremely primitive and less than 3% of the total area is under cultivation. As the plough is ill-suited to the rugged surface of the land, the ground is usually turned up with the spade. The pasture is on the whole good, but horses and cows are few, and the cows give little milk, in consequence of the coarse hay upon which they are fed. The number of sheep, however, justifies the name of the islands, the total number in the islands now exceeding 60,000. The catching of the numerous sea-birds which build their nests upon the face of the cliffs forms an important source of subsistence to the inhabitants. The puffin is taken for its feathers and for food, and the feathers of the eider duck are collected. Fowling has somewhat decreased in modern times, as the fisheries have risen in importance. The cod fishery is especially important, dried fish being exported in large quantity, and the swim-bladders made into gelatine. The whaling industry came into importance towards the close of the 19th century, and stations for the extraction of the oil and whalebone have been established at several points. The finner whale is the species most commonly taken.

More than one-third of the population is engaged in fishing. There is a small home industry in spinning and knitting. The produce of the whaling and fishing industries, woollen goods, lamb skins and feathers, are the chief exports, while in Thorshavn the preserving of fish and the manufacture of carpets are carried on to some extent. Thorshavn, the seat of government, is situated on the south-east side of Strömö, upon a narrow tongue of land, having creeks on each side, where ships may be safely moored. The houses are generally built of wood and roofed with birch bark covered with turf. The character of the people is marked by simplicity of manners, kindness and hospitality. They are healthy, and the population increases steadily. The Faeroes form an *amt* (county) of Denmark. They have also a local parliament (*lagthing*), consisting of the *amtman* and 19 other members. Among other duties, this body elects a representative to the upper

house of parliament (*landsting*) in Denmark; the people choose by vote a representative in the lower house (*folkething*). The islands are included in the Danish bishopric of Zealand.

HISTORY

It seems probable that the islands were peopled in the 9th century by Norse settlers. In the 11th century Sigmund Bresterson took possession of the islands for Olaf Trygvason, king of Norway, and introduced Christianity into the islands. The Norwegian supremacy continued till 1386, when the islands were transferred to Denmark. English adventurers gave great trouble in the 16th century, and the name of Magnus Heineson, a native of Strömö, who was sent by Frederick II. to clear the seas, is still celebrated in many songs and stories. There was formerly a bishopric at Kirkebö, south of Thorshavn, but it was abolished at the introduction of Protestantism by Christian III. Denmark retained possession of the Faeroes at the peace of Kiel in 1815. The native literature of the islands consists of the *Faereyinga Saga*, dealing with the period of Sigmund Bresterson, and popular songs and legends of early origin.

Rise of Nationalism.—Since 1910 the development of an active movement in favour of self-government has been the most prominent feature of politics in the Faeroes. Though the *Sjálvstýrisflokkur*, or Home Rule party, was first organized in 1906, some points in the nationalist programme have an earlier origin. The endeavour to secure for the national speech of the inhabitants a position of equality with the official Danish dates from the middle of last century.

Since 1912 the use of the local as well as the Danish language in education and in conduct of religious services has, to some extent, been authorized. The claims of extreme nationalists, however, are not yet satisfied. The complaints of Danish misrule made by Home Rulers seem based more on the events of the past than the present. The Danish Government has voted considerable sums towards the construction of roads and harbour works, as well as to the support of education. The large increase in the population, which has nearly doubled since the beginning of the century, indicates a considerable measure of prosperity.

FAESI, ROBERT (1883-), Swiss poet, dramatist, story-writer and literary critic, was born at Zürich on April 10, 1883, and became professor of German literature at the university of that town. He is one of the very few successful playwrights that Switzerland can boast, his tragedies *Odyseus und Nausikaa* (1911) and *Opferspiel* (1925) and the comedy of *Die Fassade* (1918) attaining a high level of excellence. His chief poems are *Aus der Brandung* (1917; an outcome of the World War) and *Der Brennende Busch* (1926). The *Zürcher Idylle* (1908) and the *König von Ste. Pelagie* (1924) are attractive

short stories. His critical works include studies of Carl Spitteler (1915), Rainer Maria Rilke (1919), and C. F. Meyer (1925), and a volume entitled *Gestalten und Wandlungen Schweizerischen Dichtung* (1922).

FAESULAE, an ancient city of Etruria, on the height 3 m. to the N.E. of Florentia, 970 ft. above sea-level (mod. *Fiesole*, *q.v.*). Remains of its walls of large blocks of stone are preserved on all sides, especially on the north-east. The whole circuit extended for about 1½ m. The Franciscan monastery (1,130 ft.) occupies the site of the acropolis, once encircled by a triple wall, of which no traces are now visible. The Roman theatre, below the cathedral to the N.E., has 19 tiers of stone seats and is 37 yd. in diameter. To the north of the theatre was an Etruscan temple with three cellae, apparently converted into the Capitolium in Roman times; while to the east of it are the Roman baths. There was also an ancient temple on the site occupied by the church of S. Alessandro. A small museum contains the objects found in the excavations.

Though Faesulae was an Etruscan city, we have no record of it in history until 225 B.C., when the Gauls passed near it in their march on Rome. Eight years later Hannibal seems to have taken this route in his march south after the victory of the Trebia. Sulla expelled some of the inhabitants from their lands to make room for his veterans, but some of the latter were soon driven out in their turn by the former occupiers. Both joined the partisans of Catiline, and Manlius, one of his supporters, made his headquarters at Faesulae. In A.D. 405 Radagaisus was crushed in the neighbouring hills, and Belisarius besieged and took it in A.D. 539.

FAFNIR, in Scandinavian mythology, the son of the giant Hreidmar. He was the guardian of the hoard of the Nibelungs.

FAGACEAE, in botany, the beech family; dicotyledonous plants, most of the 350 species being trees. The family includes five genera, the most important being *Fagus* (beech, *q.v.*), *Quercus* (oak, *q.v.*) and *Castanea* (chestnut, *q.v.*). The flowers are borne in catkins in the axils of the leaves, and are unisexual. The pollen is wind-borne. The fruit is a one-seeded nut.

FAGAN, JAMES BERNARD (1873-), an Irish playwright and producer whose works include *Shakespeare versus Shaw*, produced (1905), an adaptation of *Bella Donna* (1911), *The Happy Island* (1913), *And So to Bed* (1926) and *The Greater Love* (1927). He studied law at Trinity college, Oxford, and was attached for a time to the Indian Civil Service; later he joined the F. R. Benson company, his principal stage appearances being in this connection and at His Majesty's theatre, London, with Sir Herbert Tree.

FAGGING, in English public schools, a system under which, generally with the full approval of the authorities, a junior boy performs certain duties for a senior (from "fag" meaning "weary"; of uncertain etymology). Dr. Arnold of Rugby defined fagging as "the power given by the supreme authorities of the school to the Sixth Form, to be exercised by them over the lower boys, for the sake of securing a regular government among the boys themselves, and avoiding the evils of anarchy; in other words, of the lawless tyranny of brute force." Fagging was a fully established system at Eton and Winchester in the 16th century at least. In almost all the great public schools founded during the 19th century fagging has been deliberately adopted by the authorities. The right to fag carries with it certain well-defined duties. The fag-master is the protector of his fags and responsible for their happiness and good conduct. In cases of bullying or injustice their appeal is to him, not to the form or house master, and, except in the gravest cases, all such cases are dealt with by the fag-master on his own responsibility. Until recent years a fag's duties included such humble tasks as blacking boots, brushing clothes, and cooking breakfasts, and there was no limit as to hours. Fagging is now restricted to such light tasks as running errands, bringing tea to the "master's" study, sweeping and tidying the studies, and fagging at cricket or football.

FAGGOT, a bundle of sticks used for firewood. Recanted heretics wore an embroidered faggot on the arm as a symbol of the punishment they had escaped. In the 18th century the word is used of a "dummy" soldier appearing on the rolls of a regiment.

A "faggot-vote" is one artificially created by the minute splitting up of property so as to give a bare qualification for the franchise.

FAGNIEZ, GUSTAVE CHARLES (1842–), French historian and economist, born in Paris, Oct. 6, 1842. His *Études sur l'industrie et la classe industrielle à Paris au XIII^e et au XIV^e siècle* (1877) opened a new field for historical study. He also wrote *Documents relatifs à l'histoire de l'industrie et du commerce en France* (1898–1900), *L'Économie sociale de la France sous Henri IV.*, *Le Père Joseph et Richelieu* (1894), and *Journal parisien de Jean de Maupoint, prieur de Ste. Catherine-de-la-Courture*.

FAGUET, ÉMILE (1847–1916), French critic and man of letters, was born at La Roche sur Yon. He was educated at the Normal school in Paris, and after teaching for some time in La Rochelle and Bordeaux he came to Paris. After acting as assistant professor of poetry in the university he became professor in 1897. He was elected to the academy in 1900, and received the ribbon of the Legion of Honour in the next year. He acted as dramatic critic to the *Soleil*; from 1892 he was literary critic to the *Revue bleue*, and in 1896 took the place of M. Jules Lemaitre on the *Journal des débats*. Among his works are monographs on *Flaubert* (1899), *André Chénier* (1902), *Zola* (1903), *Balzac* (1913), *Mgr. Dupanloup* (1914), etc.; an admirably concise *Histoire de la Littérature française depuis le XVII^e siècle jusqu'à nos jours*; series of literary studies on the 17th, 18th and 19th centuries; *Questions politiques* (1899); *Propos littéraires* (3 series, 1902–05); *Le Libéralisme* (1902); *L'Anticléricalisme* (1906); *Le Pacifisme* (1908); and several works on Rousseau (between 1910 and 1912). He died in Paris on June 7, 1916.

FA-HIEN (fl. A.D. 399–414), Chinese Buddhist monk, pilgrim-traveller and writer, author of one of the earliest and most valuable Chinese accounts of India. He started from Changgan or Sigan-fu, then the capital of the Tsin empire and, passing the Great Wall, crossed the "River of Sand" or Gobi Desert beyond, that home of "evil demons and hot winds," which he vividly describes—where the only way-marks were the bones of the dead, where no bird appeared in the air above, no animal on the ground below. Arriving at Khotan, the traveller witnessed a great Buddhist festival; here, as in Yarkand, Afghanistan and other parts thoroughly Islamized before the close of the middle ages, Fa-Hien shows us Buddhism still prevailing. India was reached by a perilous descent of "ten thousand cubits," from the "wall-like hills" of the Hindu Kush into the Indus valley (about A.D. 402); and the pilgrim passed the next ten years in the "central" Buddhist realm—making journeys to Peshawur and Afghanistan (especially the Kabul region) on one side, and to the Ganges valley on another. His especial concern was the exploration of the scenes of Buddha's life, the copying of Buddhist texts, and converse with the Buddhist monks and sages whom the Brahman reaction had not yet driven out. Thus we find him at Buddha's birthplace on the Kohana, north-west of Benares; in Patna and on the Vulture Peak near Patna; at the Jetvana monastery in Oudh; as well as at Muttra on the Jumna, at Kanauj, and at Tamluk near the mouth of the Hugli. Later the narrative, which in its earlier portions was primarily historical and geographical, abandons records of fact for theology. From the Ganges delta Fa-Hien sailed with a merchant ship, in fourteen days, to Ceylon, where he transcribed all the sacred books, as yet unknown in China, which he could find; witnessed the festival of the exhibition of Buddha's tooth; and remarked the trade of Arab merchants to the island, two centuries before Mohammed.

Fa-Hien's work is valuable evidence of the strength of Buddhism in central Asia and in India at the time of the collapse of the Roman empire in western Europe. His record is careful and accurate, and most of his positions can be identified.

See James Legge, *Record of Buddhistic Kingdoms, being an account by the Chinese Monk Fa-hien of his travels in India and Ceylon*; translated and edited, with map, etc. (Oxford, 1886); S. Beal, *Travels of Fah-Hien and Sung-Yun, Buddhist pilgrims from China to India, A.D. 400 and 518*, translated with map, etc. (1869); C. R. Beazley, *Dawn of Modern Geography*, vol. i., pp. 478–485 (1897). *The travels of Fa-hsien*, retranslated by H. A. Giles (1923).

FAHLCRANTZ, CHRISTIAN ERIK (1790–1866), Swedish author, was born at Stora Tuna and studied at Uppsala, where he became tutor in Arabic in 1821, and professor of oriental languages in 1825. He then entered the Church, and in 1849 became bishop of Vesterås. He died on Aug. 6, 1866. His works include: *Noachs Ark* (2 parts, 1825 and 1826), a satire on the political and social life of his time; *Ansgarius* (1835–46), an epic in 11 parts; and *Rom förr och nu* (5 vols., 1858–61), a polemical work directed against the Jesuits.

FAHRENHEIT, GABRIEL DANIEL (1686–1736), German physicist, was born at Danzig on May 14, 1686. For the most part he lived in England and Holland, devoting himself to the study of physics and making a living, apparently, by the manufacture of meteorological instruments. He was the author of important improvements in the construction of thermometers, and he introduced the thermometric scale known by his name and still extensively used in Great Britain and in the United States (see THERMOMETRY). He also invented an improved form of hygrometer, a description of which, together with accounts of various observations and experiments made by him, was published in the *Phil. Trans.* for 1724. He died in Holland on Sept. 16, 1736.

FAIDHERBE, LOUIS LÉON CÉSAR (1818–1889), French general and colonial administrator, born on June 3, 1818, at Lille, received his military education at the École Polytechnique and at Metz, and entered the engineers in 1840. From 1844 to 1847 he served in Algeria, then two years in the West Indies, and again in Algeria, taking part in many expeditions against the Arabs. In 1852 he was transferred to Senegal as sub-director of engineers, and in 1854 became governor of the colony. He held this post with one brief interval until July 1865. The work he accomplished in West Africa constitutes his most enduring monument. At that time France possessed in Senegal little else than the town of St. Louis and a strip of coast. Faidherbe dreamed of creating a French African empire stretching from Senegal to the Red sea. By boldly advancing the French outposts on the upper Senegal he stemmed the Muslim advance on the Middle Niger, and by an advantageous treaty with Omar al-Hadji, the ruler of these countries, in 1860 he brought the French possessions into touch with the Niger. He also conquered the country lying between the Senegal and Gambia. When he resigned his post the foundation of the French dominion in West Africa had been laid. In 1863 he became general of brigade.

From 1867 to 1870 he commanded the subdivision of Bona in Algeria, and was commanding the Constantine division at the commencement of the Franco-German War. Promoted general of division in Nov. 1870, he was appointed (Dec. 3) commander-in-chief of the army of the North. The struggle between the I. German army and that commanded by Faidherbe, in which were included the hard-fought battles of Pont Nouvelles, Bapaume and St. Quentin, was perhaps the most honourable to the French army in the whole of the People's War. Elected to the National Assembly for the department of the Nord, he resigned his seat in consequence of its reactionary proceedings. Faidherbe was made chancellor of the order of the Legion of Honour. In 1872 he went on a scientific mission to Upper Egypt, where he studied the monuments and inscriptions. He was elected a senator in 1879. He died on Sept. 29, 1889, and received a public funeral. Statues and monuments to his memory were erected at Lille, Bapaume, St. Quentin and St. Louis, Senegal. His works include: *Collection des inscriptions numidiques* (1870); *Épigraphie phénicienne* (1873); *Essai sur la langue poul* (1875); *Le Zénaga des tribus sénégalaises* (1877); *Campagne de l'armée du Nord* (1871); *Le Soudan Français* (1884); *Le Sénégal* (1889).

See Brunel, *Le Général Faidherbe* (2 vols., 1892); Riethy, *Histoire populaire du général Faidherbe* (1901) and Froelicher, *Trois Colonisateurs: Bugeaud, Faidherbe, Galliéni* (1903).

FAIDIT, GAUCELM (d. c. 1220), French troubadour, was born at Uzerche. He married Guillelma Monja, and on account of his dissolute life fell into great need from which he was relieved by Richard, Coeur de Lion. His later passion for Marie de Ventadour, who persuaded him to go on the crusade, formed the subject of many of his love poems. Besides these, the chief

of which is *Le Triomphe de l'Amour*, imitated by Petrarch, Gaucelm's most important works are the poem on the death of Richard and *L'Hérésie des Prêtres*, a satire on the corruptions of the church.

See R. Meyer, *Das Leben des Troubadors Gaucelm Faidit* (Heidelberg, 1876), and F. Diez, *Leben und Werke der Troubadours* (2nd ed., Leipzig, 1883).

FAÏENCE, a term applied generally to all kinds of glazed pottery, but properly the French word for the *porzellana di Faenza*, a fine kind of glazed and painted earthenware made in Faenza, Italy (see POTTERIES AND PORCELAINS).

FAILLY, PIERRE LOUIS CHARLES DE (1810-1892), French general, was born at Rozoy-sur-Serre (Aisne) on Jan. 21, 1810, and entered the army from St. Cyr in 1828. In the war of 1859 de Failly commanded a division, and in 1867 he defeated Garibaldi at Mentana, this action being the first in which the chassepot was used. In 1870 de Failly commanded the V. corps. His inactivity at Bitsch on the 6th of August while the I. corps on his right and the II. corps on his left were crushed at Wörth and Spicheren respectively, gave rise to the greatest indignation in France, and his military career ended, after the V. corps had been severely handled at Beaumont on Aug. 30, with the catastrophe of Sedan. The rest of his life was spent in retirement. De Failly wrote *Campagne de 1870, Opérations et marche du 5^{me} corps jusqu'au 30 août* (Brussels, 1871).

FAIN, AGATHON JEAN FRANÇOIS (1778-1837), French historian, was born in Paris. Under the Consulate he entered the office of the secretary of State, in the department of the archives. In 1806 he was appointed secretary and archivist to the cabinet particulier of the emperor, whom he attended on his campaigns and journeys. He was created a baron of the empire in 1809, and, on the fall of Napoleon, was first secretary of the cabinet and confidential secretary. He published successively *Manuscrit de 1814, contenant l'histoire des six derniers mois du règne de Napoléon* (1823; new ed. with illustrations, 1906); *Manuscrit de 1813, contenant le précis des événements de cette année pour servir à l'histoire de l'empereur Napoléon* (1824); *Manuscrit de 1812* (1827); and *Manuscrit de l'an iii. (1794-1795), contenant les premières transactions de l'Europe avec la république française et le tableau des derniers événements du régime conventionnel* (1828), which form a very valuable source for the history of Napoleon I. Of still greater importance for the history of Napoleon are Fain's *Mémoires*, which were published posthumously in 1908. Immediately after the overthrow of Charles X., King Louis Philippe appointed Fain first secretary of his cabinet (Aug. 1830). Fain was a member of the council of State and deputy from Montargis from 1834 until his death in Paris on Sept. 16, 1837.

FAIR. In popular speech markets and fairs are associated. Coke says that every fair is a market, but not every market is a fair, and in terms that a fair is but a great sort of market. Although this is not admitted by all as historically true, it has become true in English legal theory. The word "fair" is indeed rather loosely used. It may mean no more than a periodical market which attracts more custom than usual, as where a town has a weekly market and designates the first market of the month a fair. The word is also used in modern speech for various private auction marts, which have no characteristic of a true market, and for certain small periodical markets confined to one commodity. But its best use is that which Coke ascribes to it. Fairs, in this sense, are of immemorial antiquity. They appear early in the dark ages on the Continent. Sidonius Apollinaris speaks of the fairs of Champagne and Brie in 427. They were common in the Low Countries by the 10th century. After the Conquest they multiplied in England, when foreign merchants were regularly passing to and fro under the protection of Norman and Angevin kings. The origin of some is lost, and few are modern; in modern times the machinery for establishing them on a legal footing is, in most European countries, similar to that for establishing a market (see MARKET). In England this is by charter or by act of parliament, but the general statutes under which any local authority may acquire (or, subject to its not infringing existing rights, may establish) a market do not extend to fairs, and therefore, where a

fair is in the hands of a local authority in England it must be by charter or by special act. While a fair is thus more difficult (in England) than a market to establish on a legal footing, it is easier to abolish. In fact, the Fairs Acts, 1868-71, provide machinery for the secretary of State to extinguish fairs which have outlived their utility. Owen's *Book of Fairs*, first published under George II. and again (after intermediate editions) in 1856, gives a list covering 62 pages of small print, but a number of these have passed into oblivion, even without formal abolition. This reflects the fact that, while markets have still a useful function, the commercial value of fairs has largely disappeared (in western Europe) with improved communications and the other changes wrought in modern trade. Thus, a fair held at Much Wenlock under a charter of Edward IV. was allowed to lapse in 1926, and a once important horse fair at Whittlesey attracted two entries only—the reason being that with improved methods of transport available at all times it is not worth while to collect a great assemblage once or twice a year. There are still commercial fairs of some local importance, noted in a recent report of the Ministry of Agriculture and Fisheries, but it may be doubted how long these will last, and it is certain that the day of the famous international fairs such as used to be held in Champagne, at Beaucaire and at Stourbridge (chartered by King John in 1211) is over in the west.

One important function which attached to many fairs—that of a "labour exchange," where servants, especially agricultural and domestic, were hired for a year—has disappeared in most countries, now that hirings are effected for shorter periods.

Pleasure Fairs.—The "pleasure fair" existed from early times side by side with the fair which was a "great market." Bartholomew Fair, held in London in August, had been granted by Henry II. to Rahere as a fair of the old style, but by the 17th century had become almost entirely a pleasure fair—of which, indeed, it became recognized as the type. Often the business and the pleasure fair were mixed, but in the 19th century many of those which still survived tended to be solely for pleasure, and even these lost much of their prestige with the coming of other popular amusements. St. Giles' Fair at Oxford and the "Mop" at Stratford-on-Avon are among those known throughout the English-speaking world which have succeeded in surviving for generations after Bartholomew Fair was abolished in 1855.

In France and Belgium "pleasure fairs" are numerous. The French Revolution swept away a number which possessed a long history, and the commercial fair has suffered reduction in importance, as in England. But even Paris retains numerous pleasure fairs, some of which last for weeks, and they are found on a smaller scale in most provincial towns and villages. Often the fair is associated with a saint's day, the festival of the saint to whom the local church is dedicated. In Brittany and Flanders the word is "kirmis," or "Church mass," which, like the German use of "messen" in the same sense, keeps alive an association which has led some writers to believe that fairs as an institution had a religious origin. The true origin of the fair as known to-day is a moot point, but it is certain that the institution of periodical great markets is older than the Christian era; indeed, as markets have been shown to arise at a certain point in the development of human institutions, so it is natural that, yearly or half-yearly (or it may be every four years, as at the Olympic Games), some specially important gathering should be held, attracting merchants from a wider area. Such a gathering would, in primitive society, pagan or Christian as the case might be, inevitably be placed under protection of the gods or saints, whose prestige would secure safe conduct for those attending.

In eastern Europe and in Asia the causes which have led to the decline of fairs in the west have so far been less operative. Thus India preserves the fair at Hurdwar, where the Ganges leaves the mountains; a natural pilgrim centre which has in consequence acquired a fair, attracting many others than Hindus. It will be long before the "westernization" of India will have made such fairs unnecessary, and probably the same may be said of Russia, which has several fairs of international fame. The best known is that of Nijni Novgorod, founded in the 17th century. Before the World

War it was calculated that more than 100,000 persons annually attended it from Asia and from Europe, and it is of interest to find it described in an official Russian publication of 1923 as "an outstanding fact in the Soviet economic scheme," playing "a decisive rôle in the commercial transactions of the union." The total value of transactions registered as taking place in the fair in that year was 378 million gold roubles, and these registered transactions excluded all private sales and those of less value than 1,000 gold roubles. Baku, Kiev, Irbit (Siberia) and Kharkov (Ukraine) are other fairs which, after being in abeyance—as was Nijni Novgorod—during the Revolution, have been revived by the Soviet Government. See also MARKET; EXHIBITION AND TRADE FAIR.

(A. N. C. S.)

United States.—In contrast with typical European fairs, where trade features predominate, American fairs have served chiefly the function of agricultural education. In the show ring, on the track, and in crop and other exhibits, accepted standards of excellence have been gradually developed. In 1927, more than 2,000 agricultural fairs were held in the United States and Canada. These included national, regional, provincial, State, county and other expositions. The total attendance was over 40,000,000. The best available data, which, however, are quite incomplete, show premiums paid to the amount of \$8,400,714. Each of 14 fairs on the North American continent pays out annually \$50,000 or more for prizes, exclusive of purses, and in five the prize money totals \$100,000 or more each. Each of 16 fairs owns grounds and buildings worth more than \$1,000,000. Almost all American fairs continue for a week, though some last as long as two weeks. Exhibits are made by national, provincial and State governments, as well as by organizations and individuals. In recent years judging contests participated in by boys and girls and by college students have been important attractions. Most fairs have various entertainment features, and the last few years have seen a marked and largely successful effort to improve these.

(R. T. H.)

FAIRBAIRN, ANDREW MARTIN (1838–1912), British Nonconformist divine, was born at Inverkeithing, Fife, on Nov. 4, 1838. He was educated at Edinburgh and Berlin, and at the Evangelical Union Theological Academy in Glasgow, and, entering the Congregational ministry, held pastorates at Bathgate, West Lothian and Aberdeen. From 1877 to 1886 he was principal of Airedale College, Bradford, a post which he gave up to become the first principal of Mansfield College, Oxford. In 1883 he was chairman of the Congregational Union of England and Wales. He resigned his position at Mansfield College in the spring of 1909, and died in London on Feb. 9, 1912.

Among his more important works are:—*Studies in the Philosophy of Religion and History* (1876); *Philosophy of the Christian Religion* (1902); *Studies in Religion and Theology* (1909). See W. B. Selbie, *Life of Andrew Martin Fairbairn* (1914).

FAIRBAIRN, SIR WILLIAM, BART. (1789–1874), Scottish engineer, was born on Feb. 19, 1789 at Kelso, Roxburghshire, where his father was a farm-bailiff. In 1803 he obtained work at three shillings a week as a mason's labourer on the bridge then being built by John Rennie at Kelso; but within a few days he was incapacitated by an accident. During his apprenticeship as a millwright at Percy Main he made the acquaintance of George Stephenson, who then had charge of an engine at a neighbouring colliery. In 1817 he entered into partnership with a shopmate, James Lillie, with whose aid he hired an old shed in High street, Manchester, where he set up a lathe and began the business which became famous throughout the world. Fairbairn investigated the use of iron in shipbuilding, and made exhaustive experiments on its strength as a building material. In 1835 he established a shipbuilding yard at Millwall, London, but his preoccupation with scientific investigation and other matters diverted his attention, and the business was sold at a loss.

In 1845 he was employed, with Robert Stephenson, in constructing the tubular railway bridges across the Conway and Menai Straits. Fairbairn investigated the construction of steam boilers, in which he effected many improvements. His fertility and readiness of invention greatly aided an inquiry carried out at his Man-

chester works (1851) by Sir William Thomson (Lord Kelvin) and J. P. Joule, at the instigation of William Hopkins, to determine the melting points of substances under great pressure; and from 1861 to 1865 he was employed to guide the experiments of the government committee appointed to inquire into the "application of iron to defensive purposes." He died at Moor Park, Surrey, on Aug. 18, 1874. Fairbairn was a member of many learned societies, both British and foreign, and in 1861 served as president of the British Association. He declined a knighthood in 1861, but accepted a baronetcy in 1869.

His youngest brother, Sir PETER FAIRBAIRN (1799–1861), founded a large machine manufacturing business in Leeds. Starting on a small scale with flax-spinning machinery, he subsequently extended his operations to the manufacture of textile machinery in general and finally to that of engineering tools. He was knighted in 1858.

See *The Life of Sir William Fairbairn*, partly written by himself and edited and completed by Dr. William Pole (1877).

FAIRBANKS, DOUGLAS (1883–), motion picture actor and producer, was born at Denver (Colo.), on May 23, 1883. He studied at the Colorado School of Mines, attended Harvard university, and entered a brokerage firm in Wall street. In 1901 he took up the stage as a career, eventually starring in several plays, among them the *Man of the Hour* and *The Gentleman from Mississippi*. Since 1915 he devoted himself to the screen, in 1917 becoming the head of his own producing company. His pictures include *The Mark of Zorro*, *The Three Musketeers*, *Robin Hood*, *Don Q*, and the *Black Pirate*. He married, on March 28, 1920, as his second wife, Mary Pickford.

FAIRBANKS, ERASTUS (1792–1864), American manufacturer, was born in Brimfield (Mass.) on Oct. 28, 1792. In 1824 he formed a partnership with his brother Thaddeus for the manufacture of stoves and ploughs. Erastus was a member of the State legislature in 1836–38, and governor of Vermont in 1852–53 and 1860–61.

His son HORACE FAIRBANKS (1820–88) became president of E. and T. Fairbanks and Co. in 1874, and was governor of Vermont from 1876 to 1878.

His brother THADDEUS FAIRBANKS (1796–1886), inventor, was born at Brimfield (Mass.) on Jan. 17, 1796. He designed the models from which he and his brother manufactured stoves and ploughs at St. Johnsbury (Vt.). In 1826 he patented a cast-iron plough which was extensively used. In 1831 Fairbanks invented a hemp-dressing machine, and the famous compound-lever platform scale, which marked a great advance in the construction of machines for weighing bulky and heavy objects. He, with his brothers, Erastus and Joseph P., founded the St. Johnsbury academy. He died at St. Johnsbury on April 12, 1886.

FAIRBANKS, a town of Alaska, situated in 64° 50' N. and 147° 44' W., about 250 m. up the Tanana river (by the windings of the stream) from its confluence with the Yukon. The population diminished from three or four thousand during high gold production to 1,155 in 1920; 1930 it was 2,101. The wagon road distance to Chitina, on the Copper river, is approximately 320 m., and to Valdez, 370 m.; by rail, 467 m. to Seward, the coast terminus. The valley of the Tanana, in this section, consists of rolling hills and fertile soil, and offers inviting conditions for settlement. It is scantily timbered and a large portion of that which once existed has been cut in the mining operations and for domestic use during the past 25 years. Coal is brought in from the Healy river mines along the Government railway. Fairbanks is headquarters of the 4th division of the district court.

FAIRBURY, a city of south-eastern Nebraska, U.S.A., on the Little Blue river, 10 m. from the Kansas State line; the county seat of Jefferson county. It is served by the Burlington, the Rock Island, and the St. Joseph and Grand Island railways. The population was 5,454 in 1920 (94% native white), and was 6,192 in 1930 by the Federal census. It is in a farming and poultry-raising country, and there are large nurseries in the vicinity. The city has railroad shops and iron works; flour, planing and alfalfa mills; cement, tile and brick works; a creamery and a condensed-milk plant; and a windmill factory. Fairbury was settled about 1869

and incorporated in 1873.

FAIRFAX, EDWARD (c. 1580–1635), English poet, translator of Tasso, was born at Leeds, the second son of Sir Thomas Fairfax of Denton. He is said to have been only about 20 years of age when he published his translation of the *Gerusalemme Liberata*, which appeared in 1600,—*Godfrey of Bulloigne, or the Recoverie of Ierusalem, done into English heroicall Verse by Edw. Faïrefax, Gent.*, and was dedicated to the queen. In the same year extracts from it were printed in *England's Parnassus*. It is said that it was King James's favourite English poem, and that Charles I. read it in prison. Fairfax employed the same number of lines and stanzas as his original, but within the limits of each stanza he allowed himself the greatest liberty. He presented, says Mr. Courthope, "an idea of the chivalrous past of Europe, as seen through the medium of Catholic orthodoxy and classical humanism." The sweetness and melody of many passages are scarcely excelled even by Spenser. He wrote also 12 eclogues, the fourth of which was published in Mrs. Cooper's *Muses' Library* (1737). Another of the eclogues and a *Discourse on Witchcraft, as it was acted in the Family of Mr. Edward Fairfax of Fuystone in the county of York in 1621*, edited from the original copy by Lord Houghton, appeared in the *Miscellanies* of the Philobiblon Society (1858–59). Fairfax died at Fewston on Jan. 27, 1635.

FAIRFAX OF CAMERON, FERDINANDO FAIRFAX, 2ND BARON (1584–1648), English parliamentary general, was born on March 29, 1584, son of Thomas Fairfax of Denton (1560–1640), first Baron Fairfax of Cameron (c. 1627). He was M.P. for Boroughbridge during the six parliaments which met between 1614 and 1629 and also during the Short Parliament of 1640. In May 1640 he succeeded his father as Baron Fairfax, but being a Scottish peer he sat in the English House of Commons as one of the representatives of Yorkshire during the Long Parliament from 1640 until his death; he took the side of the parliament, but held moderate views and desired to maintain the peace. In the first Scottish war Fairfax had commanded a regiment in the king's army; on the outbreak of the Civil War in 1642 he was made commander of the parliamentary forces in Yorkshire, with Newcastle as his opponent. Hostilities began after the repudiation of a treaty of neutrality entered into by Fairfax with the royalists. At first he met with no success. He was driven from York, where he was besieging the royalists, to Selby; then in 1643 to Leeds; and after beating off an attack at that place he was totally defeated at Adwalton Moor (June 30). He escaped to Hull, which he defended against Newcastle (Sept. 2–Oct. 11), and by means of a brilliant sally caused the siege to be raised. Fairfax was victorious at Selby (April 11, 1644), and joining the Scots besieged York, after which he was present at Marston Moor. In July he was made governor of York, in December he took the town of Pontefract, but failed to secure the castle. He resigned his command on the passing of the Self-denying Ordinance, but remained a member of the committee for the government of Yorkshire. He died from an accident on March 14, 1648, and was buried at Bolton Percy. He was twice married, and by his first wife, Mary, daughter of Edmund Sheffield, 3rd Lord Sheffield (afterwards 1st earl of Mulgrave), he had six daughters and two sons, Thomas, who succeeded him as 3rd baron, and Charles, a colonel of horse, who was killed at Marston Moor.

FAIRFAX OF CAMERON, THOMAS FAIRFAX, 3RD BARON (1612–1671), parliamentary general and commander-in-chief during the English Civil War, the eldest son of the 2nd lord, was born at Denton, near Otley, Yorkshire, on Jan. 17, 1612. He studied at St. John's College, Cambridge (1626–29), and then served as a volunteer with the English army in the Low Countries under Sir Horace (Lord) Vere, whose daughter Anne he married in 1637. He was knighted in 1640.

The Fairfaxes, father and son, though serving at first under Charles I., were opposed to the arbitrary prerogative of the crown. When Charles endeavoured to raise a guard for his own person at York, intending it to form the nucleus of an army, Fairfax presented a petition asking him to discontinue the raising of troops. This was at a meeting of the freeholders and farmers

of Yorkshire convened by the king on Heworth Moor near York. War broke out, Lord Fairfax was appointed general of the Parliamentary forces in the north, and his son, Sir Thomas, was made lieutenant-general of horse under him. Both father and son distinguished themselves in the campaigns in Yorkshire (see GREAT REBELLION). Sometimes severely defeated, more often successful, and always energetic, prudent and resourceful, they maintained the struggle until the crisis of 1644, when York was held by the marquess of Newcastle against the combined forces of the English Parliamentarians and the Scots, and Prince Rupert hastened with all available forces to its relief. The battle of Marston Moor (q.v.) was decisive of the struggle in the north. The younger Fairfax bore himself with the greatest gallantry in the battle, and though severely wounded managed to join Cromwell and the victorious cavalry on the other wing. One of his brothers, Colonel Charles Fairfax, was killed in the action.

After the passing of the Self-denying Ordinance Thomas Fairfax was selected to succeed Essex, the new lord general, with Cromwell as his lieutenant-general and cavalry commander, and after a short preliminary campaign the "New Model" justified its existence, and "the rebels' new brutish general," as the king called him, his capacity as commander-in-chief in the decisive victory of Naseby (q.v.). The king fled to Wales. Fairfax besieged Leicester, and was successful at Taunton, Bridgwater and Bristol. Oxford surrendered in 1646, and it is characteristic of the man that the general's first act was to set a strong guard on the Bodleian Library.

In Jan. 1647 Charles was delivered up by the Scots to the commissioners of parliament. Fairfax met the king beyond Nottingham, and accompanied him during the journey to Holmby, treating him with the utmost consideration. In the confused negotiations between the various parties which followed, Fairfax was placed in the unpleasant position of intermediary between his own officers and parliament. He was more at home in the field than at the head of a political committee, and, finding events too strong for him, he sought in vain to resign his commission as commander-in-chief. He remained the titular chief of the army party, and with the greater part of its objects he was in complete, sometimes most active, sympathy. Shortly before the outbreak of the second Civil War, Fairfax succeeded his father in the barony and in the office of governor of Hull. In the field against the English Royalists in 1648 his operations culminated in the successful siege of Colchester, after the surrender of which place he approved the execution of the Royalist leaders Sir Charles Lucas and Sir George Lisle, holding that these officers had broken their parole. At the same time Cromwell's great victory of Preston crushed the Scots, and the Independents became practically all-powerful.

Milton, in a sonnet written during the siege of Colchester, called upon the lord general to settle the kingdom, but the crisis was now at hand. Fairfax approved, if he did not take an active part in, Pride's Purge (Dec. 6, 1648), but on the question of the fate of Charles he opposed the army officers. He presided over the judges who were to try the king at the preliminary sitting. Then, convinced that the king's death was intended, he refused to act. In calling over the court, when the crier pronounced the name of Fairfax, Lady Fairfax, from the gallery, cried out "that the Lord Fairfax was not there in person, that he would never sit among them, and that they did him wrong to name him as a commissioner." His last service as commander-in-chief was the suppression of the Leveller mutiny at Burford in May 1649. He had been reappointed lord general, but the council of state resolved to send an army against the Scots in 1650. Fairfax resigned his commission. Cromwell was appointed his successor. Fairfax received a pension of £5,000 a year, and lived in retirement at his Yorkshire home of Nunappleton till after the death of the Protector.

The troubles of the later Commonwealth recalled him to political activity, when Monk invited his co-operation against Lambert's army. When, in Dec. 1659, he appeared at the head of a body of Yorkshire gentlemen, 1,200 horse quitted Lambert's colours and joined him. That day secured the restoration of the

monarchy. Fairfax was elected member for Yorkshire in the "free" parliament, and led the commission appointed by the House of Commons to wait upon Charles II. at The Hague and urge his speedy return.

The remaining eleven years of the life of Lord Fairfax were spent in retirement at his seat in Yorkshire. He died at Nun-appleton on Nov. 12, 1671, and was buried at Bilborough, near York. As a soldier he was exact and methodical in planning, in the heat of battle "so highly transported that scarce any one durst speak a word to him" (Whitelocke), chivalrous and punctilious in his dealings with his own men and the enemy. Honour and conscientiousness were equally the characteristics of his private and public character. But both in war and peace he was overshadowed by his associate Cromwell.

Lord Fairfax translated some of the Psalms, and wrote poems on solitude, the Christian warfare, the shortness of life, etc. During the last year or two of his life he wrote two *Memorials* which have been published—one on the northern actions in which he was engaged in 1642-44, and the other on some events in his tenure of the chief command. At York and at Oxford he endeavoured to save the libraries from pillage, and he enriched the Bodleian with some valuable mss. His only daughter, Mary Fairfax, was married to George Villiers, the profligate duke of Buckingham of Charles II.'s court.

See the correspondence of Fairfax (2 vols. ed. G. W. Johnson 1849, and 2 vols. ed. R. Bell, as *Memorials of the Civil War*, 1849); C. R. Markham, *The Great Lord Fairfax* (1870); S. R. Gardiner, *History of the Great Civil War* (1893).

His descendant Thomas, 6th baron (1692-1782), inherited from his mother, the heiress of Thomas, 2nd Baron Culpepper, large estates in Virginia, U.S.A., and having sold Denton Hall and his Yorkshire estates he retired there about 1746, dying a bachelor. He was a friend of George Washington. Thomas found his cousin William Fairfax settled in Virginia, and made him his agent, and Bryan (1737-1802), the son of William Fairfax, eventually inherited the title, becoming 8th baron in 1793. His claim was admitted by the House of Lords in 1800. But it was practically dropped by the American family, until, shortly before the coronation of Edward VII., the successor in title was discovered in Albert Kirby Fairfax (b. 1870), a descendant of the 8th baron, who was an American citizen. In Nov. 1908 Albert's claim to the title as 12th baron was confirmed by the House of Lords.

FAIRFIELD, a city of Jefferson county, Alabama, U.S.A., 5m. W. of Birmingham; served by the Birmingham Southern and the Southern railways. The population was 5,003 in 1920 (46% negroes) and was 11,059 in 1930 by the Federal census. It is an industrial suburb, with large steel plants, coke, freight-car, wire, brick and chemical works. The city was founded in 1910 to provide for the employes of the new plants of the United States Steel Corporation (which in 1907 had purchased the Tennessee Coal, Iron and Railroad company), and was laid out with a regard to beauty. It is the seat of the Employes' hospital of the Tennessee Coal, Iron and Railroad company. The city was incorporated in 1918.

FAIRFIELD, a town of Fairfield county, Connecticut, U.S.A., on Long Island sound, adjoining Bridgeport on the west. It is served by the New York, New Haven and Hartford railroad. The population in 1920 was 11,475, and was 17,218 in 1930 by the Federal census. The town is a summer resort. Truck-gardening is an important occupation, and the principal village, Fairfield, has structural steel and boiler-plate plants, an aluminium factory, a gold and silver refinery, and other manufacturing industries. The town was settled in 1639 by Roger Ludlow, who in 1637 had been one of a band which defeated the Pequot Indians in the vicinity and was attracted by the region. During the colonial period it was a place of importance, but later was overshadowed by Bridgeport. On July 8, 1779, it was burned by the British and Hessians under Governor Tryon.

FAIRFIELD, a city of south-eastern Iowa, U.S.A., on Federal highway 34 and served by the Burlington and the Rock Island railways; the county seat of Jefferson county. The popu-

lation (95% native white) was 6,619 in 1930 Federal census. It is in a blue-grass country, where much live stock is raised, and is an important market for draft horses. The city has important manufactures, especially of dairy and farm equipment which goes to all parts of the country. The output in 1927 was valued at about \$6,000,000. An annual Chautauqua assembly is held in a 30ac. park just east of the city, which has an auditorium seating 4,000. Fairfield was settled in 1839 and chartered as a city in 1847. It is the seat of Parsons college (Presbyterian), endowed by Lewis Baldwin Parsons, Sr. (1793-1855), a merchant of Buffalo, N.Y., and established in 1875.

FAIRHAVEN, a town of Bristol county, Massachusetts, U.S.A., on Buzzard's bay, opposite New Bedford; served by the New York, New Haven and Hartford railway. The population in 1930 was 10,951. It is a summer resort, and has a number of factories, making tacks, laundry machines, small yachts and boats and toilet powder. From 1830 to 1857 whaling was the principal industry, but the fishing interests are now relatively unimportant. Many of the public buildings were gifts from Henry H. Rogers (1840-1909), long vice president of the Standard Oil Company, who was a native of the place. Fairhaven was separated from New Bedford and incorporated as a town in 1812. In Sept. 1778, forces from the fleet under Lord Grey, sent to punish New Bedford for its privateering, dismantled the small fort which had been built early in the war on the east side of the harbour; and a day or two later they began to set fire to Fairhaven, but were driven off by 150 minute-men under Major Israel Fearing. The fort was rebuilt at once, and during the war of 1812 (under the name of Ft. Phoenix) was one of the strongest defences on the New England coast.

FAIR ISLAND. An isolated island situated between the Orkney and Shetland islands north-east of Scotland. It has an area of six sq.m. and is of rocky formation. The principal industries are fishing, sheep farming and the knitting of multi-coloured garments for which the island is famous. It is noted among ornithologists for the numerous species of migrant birds observed there.

FAIRMONT, a city of southern Minnesota, U.S.A., 120m S.W. of Minneapolis; the county seat of Martin county. It is on Federal highway 16, and is served by the Chicago and North Western and the Chicago, Milwaukee, St. Paul and Pacific railways. The population was 4,630 in 1920 (88% native white) and was 5,521 in 1930 by the Federal census. It is the trade centre for a farming, dairying and poultry-raising region, is a summer resort and has sundry manufacturing industries. The city was founded about 1866 and incorporated in 1886.

FAIRMONT, a city of northern West Virginia, U.S.A., 75m S. by W. of Pittsburgh, at the head of navigation on the Monongahela river; the county seat of Marion county. It is on Federal highway 19, and is served by the Baltimore and Ohio and the Monongahela railways. The population was 17,851 in 1920; 1930 it was 23,159. The city is built on hills, at an altitude of 800 to 900 feet. It is an important shipping point for coal, of which over 8,000,000 tons were mined in the county in 1926; it is the seat of a State normal school, and has various manufacturing industries (including powder and chemical plants, glass works and textile mills) with an output in 1927 valued at \$10,495,160. A town was laid out here in 1819, which in 1842 became the county seat of the newly erected county. Until about 1844 it was called Middle town. The city was chartered in 1899. Since 1890, when the population was only 1,023, it has grown rapidly. In 1920 the population was 17,851.

FAIR OAKS, a station on a branch (formerly famous as the York river railway) of the Southern railway, 6m. east of Richmond, Virginia, U.S.A. It is noted as the site of one of the battles of the Civil War, fought on May 31 and June 1, 1862, between the Union (Army of the Potomac) under Gen. G. B. McClellan and the Confederate forces (Army of Northern Virginia) commanded by Gen. J. E. Johnston. The attack of the Confederates was made at a moment when the river Chickahominy divided the Federal army into two unequal parts—two corps on the south bank, three on the north—and was, moreover, swollen

to such a degree as to endanger the bridges. Gen. Johnston stationed part of his troops along the river to prevent the Federals sending aid to the smaller force south of it, upon which the Confederate attack, commanded by Gen. Longstreet, was directed. Many accidents, due to the inexperience of the staff officers and to the difficulty of the ground, hindered the development of Longstreet's attack, but the Federals were gradually driven back with a loss of ten guns, though at the last moment reinforcements managed to cross the river and re-establish the line of defence. At the close of the day Johnston was severely wounded, and Gen. G. W. Smith succeeded to the command. The battle was renewed on June 1 but not fought out. At the close of the action Gen. R. E. Lee took over the command of the Confederates, which he held till the final surrender in April 1865. So far as the victory lay with either side, it was with the Union army, for the Confederates failed to achieve their purpose of destroying the almost isolated left wing of McClellan's army, and after the battle they withdrew into the lines of Richmond. The Union losses were 5,031 in killed, wounded and missing; those of the Confederates were 6,134. The battle is alternatively known as the battle of Seven Pines.

FAIRPORT HARBOR, village, Lake county, Ohio, U.S.A., on Lake Erie, 28m. N.N.E. of Cleveland. It is a port of entry, and is served by the Baltimore and Ohio railroad and lake steamers. The population was 4,211 in 1920; and was 4,972 in 1930. It has one of the finest natural harbours, and one of the oldest lighthouses, on Lake Erie. The commerce of the port in 1925 amounted to 4,327,276 tons, valued at \$41,941,156, and consisted largely (on the basis of tonnage) of incoming iron ore and limestone and shipments of coal. A Finnish newspaper is published here. The village was settled in 1812, by pioneers from Connecticut, and the first county court was held here. It soon became an important commercial port. In 1847 cargoes valued at \$991,000 (chiefly farm wagons, furniture, cheese, flour and oil of peppermint) were carried by the 2,987 sailing vessels that entered the harbour.

FAIR TRADE, the name given in 1881 in Great Britain to a movement to protect industry from foreign competition by means of import duties. The term "fair trade" was coined to express the conception that free trade was unfair unless reciprocal, and that Great Britain should not admit duty free goods imported from countries which denied free trade to British exports. The boom in British trade of the decade before, having been followed by a period of depression culminating in great unemployment and distress, a fair trade league was formed in 1881. The league found many adherents and published a weekly journal called *Fair Trade*, the issue of which was continued until 1890, when with the revival of industry the agitation died down and was not renewed until the tariff reform movement of the end of the 19th century, led by Joseph Chamberlain. (See PROTECTION; TARIFF REFORM.)

FAIRŪZĀBĀDĪ (Abū-ṭ-Tāhīr ibn Ibrāhīm Majd ud-Dīn ul-Fairūzābādī) (1329-1414), Arabian lexicographer, was born at Kārazīn near Shiraz. His student days were spent in Shiraz, Wāsīt, Baghdad and Damascus. He taught for ten years in Jerusalem, and afterwards travelled in western Asia and Egypt. In 1368 he settled in Mecca, where he remained for 15 years. He next visited India and spent some time in Delhi, then remained in Mecca another ten years. The following three years were spent in Baghdad, in Shiraz (where he was received by Timur), and in Ta'iz. In 1395 he was appointed chief *qadi* (qadi) of Yemen, married a daughter of the sultan, and died at Zabīd in 1414. During this last period of his life he converted his house at Mecca into a school of Mālikite law and established three teachers in it. He wrote a huge lexicographical work of 60 or 100 volumes uniting the dictionaries of Ibn Sīdā, a Spanish philologist (d. 1066), and of Sajānī (d. 1252). A digest of or an extract from this last work is his famous dictionary *al-Qāmūs* ("the Ocean"), which has been published in Egypt, Constantinople and India, has been translated into Turkish and Persian, and has itself been the basis of several later dictionaries.

FAIRWAY, the navigable channel of a river or other waterway. It is usually marked by buoys of distinctive shape, letter

or colour. The maintenance of a fairway is often a matter of great care, calling for continuous dredging and clearance. (See RIVER ENGINEERING; DREDGERS AND DREDGING; BUOY.) By derivation, the term is also used of the open passage on a golf course between the hazards, such as furze, water, bunkers. (See GOLF.)

FAIRY, the common term for a supposed race of supernatural beings who magically intermeddle in human affairs. (Fr. *fée*, *faerie*; Prov. *fada*; Sp. *hada*; Ital. *fata*; med. Lat. *fatāre*, to enchant, from Lat. *fatum*, fate, destiny.) They are not the immediate product of one country or of one time; they have a pedigree. But mixture and connection of races have so changed the original folk-product that it is difficult to separate the different strains that have gone to the moulding of the result.

It is not in literature that the early forms of the fairy belief must be sought. Many of Homer's heroes have fairy lemans, called nymphs, but the fairy leman is familiar to the unpoetical Eskimo, and to the Red Indians, with their bird-bride and beaver-bride (see A. Lang's *Custom and Myth*, "The Story of Cupid and Psyche"). The Gandharvas of Sanskrit poetry are also fairies.

One of the most interesting facts about fairies is the wide distribution and long persistence of the belief in them. They are the chief factor in surviving Irish superstition. Here they dwell in the "raths," old earth-forts. They are an organized people, and their life corresponds to human life in all particulars. They carry off children and are generally the causes of all mysterious phenomena. Whirls of dust are caused by the fairy marching army, as by the beings called Kutchi in the Dieri tribe of Australia. The fairy changeling belief also exists in some districts of Argyll. In Ireland and the west Highlands neolithic arrow-heads and flint chips are still fairy weapons. They are dipped in water, which is given to ailing cattle and human beings as a sovereign remedy for diseases. In the Highlands there is much more interest in second sight than in fairies, while in Ireland the reverse is the case. The best book on Celtic fairy lore is still that of the minister of Aberfoyle, the Rev. Mr. Kirk (ob. 1692). His work on *The Secret Commonwealth of Elves, Fauns, and Fairies*, left in ms. and incomplete (the remainder is in the Laing mss., Edinburgh University library), was published (100 copies) in 1815 by Sir Walter Scott, and in the *Bibliothèque de Carabas* (Lang) there is a French translation.

It is clear that in many respects fairyland corresponds to the pre-Christian abode of the dead. Like Persephone when carried to Hades, or Wainamöinen in the Hades of the Finns (Manala), a living human being must not eat in fairyland; if he does, he dwells there for ever.

There is a theory that the fairies survive in legend from prehistoric memories of a pigmy people dwelling in the subterranean earth-houses, but the contents of these do not indicate an age prior to the close of the Roman occupation of Britain; nor are pigmy bones common in neolithic sepulchres. The "people of peace" (*Daoine Shie*) of Ireland and Scotland are usually of ordinary stature, only varying from mankind by their proceedings. (See J. Curtin, *Irish Folk-tales*.)

The belief in a species of lady fairies, deathly to their human lovers, was found by R. L. Stevenson to be as common in Samoa (see *Island Nights' Entertainments*) as on the banks of Loch Awe. The Greek sirens of Homer are a form of these fairies, as the Nereids, Oreads and Naiads are fairies of wells, mountains and the sea. The fairy women who come to the births of children and foretell their fortunes (*Fata*, *Moerae*, ancient Egyptian *Hathors*, *Fées*, *Dominae Fatales*), with their spindles, are refractions of the human "spae-women" (in the Scots term) who derive omens of the child's future from various signs. These women, represented in the spiritual world by *Fata*, bequeath to us the French *fée*, in the sense of fairy. Perrault uses *fée* for anything that has magical quality.

The nearest analogy to the shape which fairy belief takes in Scotland and Ireland—the "pixies" of south-western England—is in *Jān* or *Jinnis* of the Arabs, Moors and people of Palestine. In stories which have passed through a literary medium, like *The Arabian Nights*, the *geni* or *Jān* do not so much resemble our fairies as they do in the popular superstitions of the East, orally

collected. They chiefly differ from our fairies in their greater tendency to wear animal forms; though when they choose to appear in human shape they are not to be distinguished from mortals. Like the fairies everywhere they have amours with mortals. The herb rue is potent against them, as in British folklore. They, like the British brownies (a kind of domesticated fairy), are the causes of strange disappearances of things. To preserve houses from their influences rue is kept, and the name of Allah is constantly invoked.

They often bear animal names. Euphemistically they are addressed as *mubārakin*, "blessed ones." As our fairies give gold which changes into withered leaves, the *Jān* give onion peels which turn into gold. Like our fairies the *Jān* can apply an ointment, kohl, to human eyes, after which the person so favoured can see *Jān*, which are invisible to other mortals, and can see treasure wherever it may be concealed. (See *Folk-lore of the Holy Land*, by J. E. Hanauer, 1907.)

The enjoyment of love between a fairy and a mortal is generally qualified by some restriction or compact, the breaking of which is the cause of calamity to the lover and all his race, as in the notable tale of Melusine (*q.v.*, and see the chapter *De lamis et nocturnis larvis* in *Otia Imperialia*, written early in the 13th century, by Gervaise of Tilbury). At the birth of Ogier le Danois six fairies attend, five of whom give good gifts, which the sixth overrides with a restriction. There is little in these fairies of romance to distinguish them from human beings, except their supernatural knowledge and power. To this class belong the fairies of Boiardo, Ariosto and Spenser.

There is no good modern book on the fairy belief in general. Keightley's *Fairy Mythology* is interesting; Rhys's *Celtic Mythology* is copious about Welsh fairies, practically identical with those of Ireland and Scotland. The works of Mr. Jeremiah Curtin and Dr. Douglas Hyde are useful for Ireland; for Scotland, Kirk's *Secret Commonwealth* has already been quoted. Scott's dissertation on fairies in *The Border Minstrelsy* is rich in lore, though Scott had not the benefit of recent researches. There is a full description of French fairies of the 15th century in the evidence of Jeanne d'Arc at her trial (1431) in Quicherat's *Procès de Jeanne d'Arc*, vol. i. pp. 67, 68, 187, 209, 212; vol. ii. pp. 390, 404, 450. In another vein is Sir A. Conan Doyle's *The Coming of the Fairies* (1922).

FAIRY RING, the popular name for the circular patches of a dark green colour seen occasionally on permanent grass-land, either lawn or meadow, on which the fairies were supposed to hold their midnight revels. They mark the area of growth of some fungus, starting from a centre of one or more plants. The mycelium produced from the spores dropped by the fungus or from the "spawn" in the soil, radiates outwards, and each year's successive crop of fungi rises from the new growth round the circle. The rich colour of the grass is due to the fertilizing quality of the decaying fungi, which are peculiarly rich in nitrogenous substances. For further details see *FUNGI*.

FAITH is an attitude of mind which, though not confined to religious experience, can best be examined by setting out from its manifestations within that sphere of experience. There we find in clearest form illustrations of the several shades of meaning which the word "faith" has borne. A classic definition is that presented in the *Epistle to the Hebrews*, xi. 1: "faith is the substance of things hoped for, the evidence of things not seen." The word for "evidence" is, in the Revised version, rendered as "proving," and for "substance" are offered the alternative translations "assurance" and "the giving substance to." Assurance, certitude or convincedness, and giving substance to what we do not perceive and as to which we, therefore, only entertain an idea or a supposition, may at first seem somewhat disparate meanings for one word; but the connection between them is revealed by a common signification of the word "realize." We speak of realizing what some event is when we discern its import, and when what was, so to say, "nothing to us" is found to be something with which we have to reckon or which can influence our thought and action. Personal certitude or conviction as to what as yet is not matter of scientific knowledge or proven with logical certainty, is of the essence of faith; and action upon it may lead on to discovery of the actuality of the object, *i.e.*, to substantiation of the hoped-for or the unseen. In the case of faith in God, whom "no

man hath seen at any time," such certitude cannot issue in sight or sensibly verified knowledge; though it may develop into "proving" in the sense of establishing reasoned and reasonable belief, such as fact and experience corroborate. But in other spheres faith often issues in knowledge, such as can be characterized as seeing or perceiving what, without such exercise of faith, would have remained unseen or unknown. Thus the faith of Columbus "realized" America for the European; and an idea of Stephenson's led to the actual locomotive engine. In neither case did faith create the reality, but in both it substantiated the unseen, and brought men into actual touch with what had been but conceived or supposed. Thus faith begins in creating or fashioning an idea; and it may issue in finding a real counterpart to the idea. There is, however, no necessity that it shall so issue; and frequently it does not; no one, *e.g.*, has realized the idea of a machine capable of perpetual motion, though many have experimented with the notion. The description of faith cited above from Heb. xi. 1 is only lacking in psychological completeness, in that it contemplates successful ventures alone, and is silent as to such as may fail. Otherwise it is of more general and exhaustive a nature than is any other conception met with in the New Testament. For instance, St. Paul considers the efficacy of faith only in so far as it is faith in Christ or in God; one of his central doctrines is that we are justified by God through faith in Christ. On the other hand the writer of *Hebrews* includes, among his illustrations of the faithful life, the case of Rahab who was one of "them that believed not" in the God of Israel; and the object of faith, with him, includes the whole region of the unseen, whatever it may contain. His teaching is aptly expressed in the lines of Hartley Coleridge: faith

"... is an affirmation and an act
That binds eternal truth to present fact."

The long list of instances of the faithful given in Heb. xi. is made up of prophets, kings, etc., who achieved the heroic life and victories of various kinds, in virtue of their souls being possessed by faith; their faith was verified by their lives. They are all concrete embodiments of the principle "nothing venture, nothing have." And that principle is not only the essence of religious faith; it underlies the acquisition of all human knowledge, such as, for the conduct of life, is most worth having. Thus the "father of the faithful" who obeyed his inward summons and went forward "not knowing whither" is an allegory of the intellectual progress of mankind. Man did not begin with scientific knowledge or knowing, but with learning through doing. He learned by failure as well as by success, and in either case he ventured before he came to have. The uniformity of nature, *e.g.*, was not written so legibly on natural phenomena that, in the time of man's primitiveness, he who ran could read it off. On the other hand, if it had not been tentatively assumed, here a little and there a little, it could never have got "substance" for man's knowledge or relevance to his life; had it not been trusted while as yet unverified, no evidence of its actuality could have emerged. And the most recent advance in logic consists in making clearer than ever before that this principle of uniformity, underlying all our inductive science, is, and must ever remain, a postulate incapable of logical proof. Thus faith, in its primary sense, is not a word to be confined to the vocabulary of theology. Philosophy, or theory of knowledge, requires it and so does science, if it would understand its own logical structure and the presuppositions on which it rests. Probability is not only "the guide of life"; it is also of the very texture of all "knowledge" as to the actual world as distinguished from pure mathematics or truth as to the relations between ideas; and probability in the last resort, *i.e.*, in the case of the fundamental postulates underlying induction—is not a matter of numerical calculability or of formal logic, but of human hope, sanguine expectation, faith in the unseen. Instead of being logically certified it is but pragmatically "verified." The old hard and fast line between knowledge and belief or faith has disappeared. The very rationality of the world, which science would read and expound, is at bottom an idea of faith. Reason, if it include the discovery of true premises as well as the logical

deduction of consequences from premises that may be either true or false, contains faith as well as logical linkage of sense-data.

Besides the primary meaning that has been set forth "faith" has borne others. Sometimes the word has been used as a synonym for "belief" or intellectual assent. But whereas belief is more or less constrained by fact already known, and which convinces us independently of any striving on our part, "faith" is generally used to emphasize the active or volitional element of experience, involved in venture reaching beyond the already known. Faith, again, is to be distinguished from credulity, with which it is apt to be confounded. The open mind and docility, personified in the New Testament as "the little child" are requisite for reception of truth; but there is no beatitude on credulousness. If faith, or the working to a lead or suggestion that experience suggests but does not warrant, is to issue in reasonable belief, credulity must be restrained by resort to the method of doubt, which is equally essential for acquisition of knowledge. And faith proper is doubt-sifted credulity. It proves all things before holding fast to them as true, and pursues no apparently open road after it has been shown to be closed; whereas credulity is interested belief, such as is often resorted to in order to escape the discomfort of uncertainty. Faith or belief worth calling belief must often "be purchased with the sweat of the brow." Another meaning of "faith" current in theological literature as well as in common speech, is that of trust. This resembles faith, as above described, and differs from belief in involving will and feeling: but it is rather an attitude issuing out of, and presupposing, the faith which creates its idea and then establishes belief in its actuality. Before we can trust in God, we must first believe that He is; and that belief is acquired by a venture of faith. Lastly, it is unnecessary to narrow down faith to *moral* postulation, or to the attitude of valuation, exclusively. Religious faith was forthcoming before advanced morality appeared; moreover, it is not concerned with what ought to be real or realized, but with what *is* realizable. Theology founded on faith is dogma concerning ultimate reality, not pictorial recipes for pious conduct. When religious faith is conceived as but a particular case of the faith that is involved in all knowledge and reason, science and faith can be seen to be complementary, not mutually exclusive; they can lodge, without need of reconciliation, in brotherly relation within one mind, provided the mind is content with reasonableness, where logical rationality is unattainable.

See W. R. Inge, *Faith* (1909); J. Ward, *Essays in Philosophy* (1927); G. Galloway, *Faith and Reason in Religion* (1927).

(F. R. T.)

FAITHFULL, EMILY (1835-1895), English philanthropist, daughter of the Rev. Ferdinand Faithfull, was born at Headley rectory, Surrey, in 1835. She took a great interest in the conditions of working-women, and in 1860 she set up in London a printing establishment for women. She was shortly afterwards appointed printer and publisher in ordinary to Queen Victoria. In *The Victoria Magazine* (est. 1863) she continuously and earnestly advocated the claims of women to remunerative employment. In 1868 she published a novel, *Change upon Change*. She lectured widely and successfully both in England and the United States on feminist subjects. Emily Faithfull died in Manchester on May 31, 1895.

FAITH HEALING, a form of "mind cure," characterized by the doctrine that pain and disease really exist, but may be neutralized and dispelled by faith in Divine power; Christian Science (*q.v.*) holds that pain is an illusion and seeks to cure the patient by instilling into him this belief. In the Christian Church the tradition of faith healing dates from the earliest days of Christianity; upon the miracles of the New Testament follow cases of healing, first by the Apostles, then by their successors. After the 3rd century it became transformed into trust in relics, though faith cures still occur sporadically in later times. With the Reformation faith healing proper reappears among the Moravians and Waldenses, who, like the peculiar people of our own day, put their trust in prayer and anointing with oil. In the 16th century faith cures were recorded of Luther and other reformers, in the next century of the Baptists, Quakers, and other Puritan sects, and in the 18th century the faith healing of the Methodists in this coun-

try was paralleled by pietism in Germany. In the 19th century Prince Hohenlohe-Waldenburg-Schillingsfurst, canon of Grosswardein, was a famous healer on the continent; the Mormons and Irvingites were prominent among English-speaking peoples; in the last quarter of the 19th century faith healing became popular in London, and Bethshan homes were opened in 1881, and since then it has found many adherents in England.

Under faith healing in a wider sense may be included (1) the cures in the temples of Aesculapius and other deities in the ancient world; (2) the practice of touching for the king's evil, in vogue from the 11th to the 18th century; (3) the cures of Valentine Greatrakes, the "stroker" (1620-83); and (4) the miracles of Lourdes and other resorts of pilgrims, including St. Winifred's well in Flintshire, Trêves with its holy coat, the grave of the Jansenist F. de Paris in the 18th century, the little town of Keverlaer from 1641 onwards, the tombs of St. Louis, Francis of Assisi, Catherine of Siena, and others.

An animistic theory of disease was held by several European faith healers. Used in this sense, faith healing is indistinguishable from much of savage leech-craft, which seeks to cure disease by expelling the evil spirit in some portion of the body. Although it is usually present, faith in the medicine man is not essential for the efficacy of the method. The same may be said of the lineal descendant of savage medicine—the magical leech-craft of European folk-lore; cures for toothache, warts, etc., act in spite of the disbelief of the sufferer; how far incredulity on the part of the healer would result in failure is an open question.

From the psychological point of view all kinds of mind cure depend on suggestion (*q.v.*). In faith healing proper powerful direct suggestions are used, while the religious atmosphere and the auto-suggestions of the patient co-operate, especially where the cures take place during a period of religious revival when large assemblies and strong emotions are found.

See A. T. Myers and F. W. H. Myers in *Proc. Soc. Psychical Research*, ix. 160-209, on the miracles of Lourdes, with bibliography; A. Feilding, *Faith Healing and Christian Science*; O. Stoll, *Suggestion und Hypnotismus in der Volkerpsychologie*; article "Greatrakes" in *Dict. Nat. Biog.* (N. W. T.)

FAITHORNE, WILLIAM (1626 or 1627-1691), English painter and engraver, was born in London and was apprenticed to Robert Peake, a painter and printseller. On the outbreak of the Civil War he accompanied his master into the king's service, and being made prisoner at Basinghouse, he was confined for some time to Aldersgate, where, however, he was permitted to follow his profession of engraver, and among other portraits, did a small one of the first Villiers, duke of Buckingham. He was soon released, but only on condition of retiring to France. There he received instruction from Robert Nanteuil. He returned to England about 1650, and carried on his work as an engraver and printseller in a shop near Temple bar. In 1680 he gave up his shop and retired to a house in Blackfriars, occupying himself chiefly in painting portraits from the life in crayons, although still occasionally engaged in engraving. Faithorne engraved the portraits of a large number of eminent persons, including Sir Henry Spelman, Oliver Cromwell, Henry Somerset, the marquis of Worcester, John Milton, Queen Catherine, Prince Rupert, Cardinal Richelieu, Sir Thomas Fairfax, Thomas Hobbes, Richard Hooker, Robert 2nd earl of Essex, and Charles I. Faithorne wrote *The Art of Graving and Etching* (1662). He was the master of Wenceslaus Hollar. He was buried at St. Anne's, Blackfriars, on May 13, 1691.

In addition to his engraved portraits, Faithorne executed many portrait-drawings in crayons, examples of which may be seen in the British Museum, the Bodleian and other collections. Among the most famous of his engravings are two exceedingly rare maps, "an exact delineation" of the cities of London, Westminster and suburbs (only impression known in *Bibl. Nat.*, Paris) in 12 sheets, measuring in all 72 by 39 in.; one of Virginia and Maryland (only known impression in Grenville library, Brit. Mus., London) in 4 sheets, measuring altogether 36 by 31 inches. In May 1857 Messrs. Evans, London, and again in 1878, Stanford, London, published facsimiles of the map in the *Bibliothèque Nationale*.

His son WILLIAM (1656-1686), mezzotint engraver, engraved portraits of Charles II., Mary princess of Orange, Queen Anne when princess of Denmark, and Charles XII. of Sweden.

The best account of the Faithornes is that contained in Walpole's *Anecdotes of Painting*. A life of Faithorne the elder is preserved in the British Museum among the papers of Bayford, librarian to Lord Oxford, and an intimate friend of Faithorne.

FAIZABAD, a town of Afghanistan, capital of the province of Badakshan, situated on the Kokcha river. In 1821 it was destroyed by Murad Beg of Kunduz, and the inhabitants removed to Kunduz. But since Badakshan was annexed by Abdur Rahman, the town has recovered its former importance, and is now a considerable place of trade. It is the chief cantonment for eastern Afghanistan and the Pamir region, and is protected by a fort built in 1904.

FAJARDO, the largest and most important town on the eastern coast of Porto Rico. According to the census of 1920 the population was 6,571, which had increased to 7,322 in 1930. Fajardo is a prosperous town with considerable shipping and local trade. The district is one of the richest sugar-producing parts of the island; in it is located the plant of the Fajardo Sugar Company. It has good schools, churches, stores and shops, and is connected with the other towns by rail and highways. Motor-bus service is available to all points, and the port has service both for freight and passenger transportation.

FAJELU: see BARI.

FAKHR UD-DĪN RĀZI (1149-1209), Arabian historian and theologian, was born at Rai (Rei, Rhagae), near Teheran. Here and at Marāgha he studied philosophy and theology. He was a Shafī'ite in law and a follower of Ash'arī (*q.v.*) in theology, and became renowned as a defender of orthodoxy. During a journey in Khwarizm and Mawara'n-nahr he preached both in Persian and Arabic against the sects of Islam. He settled later in Herat, where he died.

His greatest work, the *Mafātiḥ ul-Ghaib* ("The Keys of Mystery"), an extensive commentary on the Koran appeared at Cairo (8 vols., 1890). His dogmatic position may be seen from his work *Kitāb ul-Muḥassal*, which is analysed by Schmōlders in his *Essai sur les écoles philosophiques chez les Arabes* (Paris, 1842). Extracts from his *History of the Dynasties* were published by Jourdain in the *Fundgruben des Orientis* (vol. v.), and by D. R. Heinzius (St. Petersburg, 1828).

See also F. Wüstenfeld, *Geschichte der arabischen Ärzte*, No. 200 (Göttingen, 1840); for a list of his works cf. C. Brockelmann's *Gesch. der arabischen Literatur*, vol. 1 (Weimar, 1898) and M. Schreiner, *Zeitschr. der deuts. morgenländischen Gesellsch.* vol. 52.

BY COURTESY OF THE BOARD OF FOREIGN MISSIONS

A NOMAD FAKĪR OF INDIA READING HIS PRAYERS ON A BED OF NAILS. This class of fakīr has little in common with the religious order of the same name, except a claim to sanctity. The beggars that compose it wander about the country, living on alms and subjecting themselves to unbelievable tortures

FAKĪR (fah-kēr), a generic term, synonymous with Dervish, for a religious mendicant. A Mohammedan word, it has come to be applied also to Hindus, replacing *bhikshu* and older words. Fakirs are common to all the creeds of India, and in theory

mostly belong to a religious order. But as a Muslim order does not usually profess celibacy and the Hindu and other orders do not always enforce it, the orders tend to form castes on the ordinary pattern. Where strict monasticism has been maintained the influence of the orders has been on the whole good. But when discipline has been relaxed, many evils have ensued. Mendicancy has often become a pretext for extortion and occult powers a cloak for impudent swindling, sometimes assisted by murder. While many fakirs practise austerities of the severest kinds, others peregrinate the country with performing animals, selling love philtres, profess to transmute silver coin or other metals into gold, and batten on the credulity of the people. The chief Hindu orders are the Saniasis, Gosains, Jogis (who in theory profess *yoga*), bairāgis, the Sikh Udāsīs, Nirmalas, Akālīs, the Mohammedan Chishtīs, Qādirīs, Suharwardīs, Naqshbandīs, who owe much to Sufism (*q.v.*); and a host of minor fraternities. Several orders have militant branches.

FALAISE, a town of north-western France, capital of an arrondissement in the department of Calvados, on the right bank of the Ante, 19 m. S. by E. of Caen by road. Pop. (1926) 5,263. The castle, now partly in ruins, was formerly the seat of the dukes of Normandy and the birthplace of William the Conqueror. It stands on a high crag overlooking the town, and consists of a square mass defended by towers and flanked by a small donjon and a lofty tower added by the English in the 15th century; the rest of the castle dates chiefly from the 12th century. Near the castle, in the Place de la Trinité, is an equestrian statue in bronze of William the Conqueror, to whom the town owed its prosperity. From 1417, when the town succumbed to Henry V. of England, till 1450, when it was retaken by the French, Falaise was in the hands of the English. Falaise has populous suburbs, one of which, Guibray, is celebrated for its annual fair for horses, cattle and wool, which has been held in August since the 11th century. The town is the seat of a subprefecture and has tribunals of first instance and commerce, a chamber of arts and manufacture and a board of trade-arbitrators. Tanning (from at least the 11th cent.) and some cotton manufactures are carried on.

FALASHAS or "Jews of Abyssinia," a tribe of Hamitic stock, akin to Galla, who profess the Jewish religion and claim to be descended from the ten tribes banished from the Holy Land. Another tradition assigns them, as ancestor, Menelek, Solomon's alleged son by the queen of Sheba. It is uncertain when they became Jews: one account suggests in Solomon's time; another, at the Babylonian captivity; a third, during the 1st century of the Christian era. One of the earlier dates is in all probability correct since the Falashas know nothing of either the Babylonian or Jerusalem Talmud, make no use of phylacteries (*tefillin*), and observe neither the feast of Purim nor the dedication of the temple. They possess—not in Hebrew, of which they are altogether ignorant, but in Ethiopic (or Geez)—the canonical and apocryphal books of the Old Testament; a volume of extracts from the Pentateuch, with comments given to Moses by God on Mount Sinai; the Te-e-sa-sa Sanbat, or laws of the Sabbath; the Ardit, a book of secrets revealed to twelve saints, which is used as a charm against disease; lives of Abraham, Moses, etc.; and a translation of Josephus called Sana Aihud. A copy of the Orit or Mosaic law is kept in the holy of holies in every synagogue. Every newly-built house is considered uninhabitable till the blood of a sheep or fowl has been spilt in it; a woman guilty of a breach of chastity has to undergo purification by leaping into a flaming fire; the Sabbath has been deified, and, as the goddess Sanbat, receives adoration and sacrifice and is said to have ten thousand times ten thousand angels to wait on her commands.

Under the monastic system, founded it is said in the 4th century A.D. by Aba Zebra, a pious man who retired from the world and lived in the cave of Hoharewa, in the province of Armatshoho, the monks must prepare all their food with their own hands, and no lay person, male or female, may enter their houses. Priests are allowed to marry once only, and no one is admitted into the order who has eaten bread with a Christian, or is the son or grandson of a man thus contaminated. Belief in the evil eye or shadow is universal, and spirit-raisers, soothsayers and rain-doctors are in

repute. Education is in the hands of the monks and priests, and is confined to boys. Fasts, obligatory on all above seven years of age, are held on every Monday and Thursday, on every new moon and at the passover (April 21 or 22). The annual festivals are the passover, the harvest feast, the Baala Mazalat or feast of tabernacles (during which, however, no booths are built), the day of covenant or assembly and Abraham's day. It is believed that after death the soul remains in a place of darkness till the third day, when the first sacrifice for the dead is offered; prayers are read in the synagogue for the repose of the departed, and for seven days a formal lament takes place every morning in his house. No coffins are used, and a stone vault is built over the corpse so that it may not come into direct contact with the earth.

The Falashas live for the most part in villages of their own, or, if settled in a Christian or Mohammedan town, occupy a separate quarter. Their own kings, they pretend, were descended from David, but in 1800, the royal race became extinct, and they then became subject to the Abyssinian kingdom of Tigré. They do not mix with the Abyssinians, and never marry women of alien religions. They are even forbidden to enter the houses of Christians, and from such a pollution have to be purified before entering their own houses. Polygamy is not practised; early marriages are rare and their morals are generally better than those of their Christian masters. They have no liking for trade, but are skilled in agriculture, in the manufacture of pottery, ironware and cloth and are good masons.

Faitlovitch, *Notes d'un voyage chez les Falachas* (1905).

FALCÃO, CHRISTOVAM (?1512–?1553), Portuguese poet, born at Portalegre in the Alemtejo, is said to have fallen in love with an 11-year-old heiress, Maria Brandão, to have married her, and to have been separated from her by hostile parents. He then entered the diplomatic service, and died about 1553. The love story is told in some beautiful lyrics and in the charming eclogue *Chrisfal*. Falcão was the friend of Bernardim Ribeiro, and the poems are very similar in style to Ribeiro's. It is suggested by many critics that *Chrisfal* is really Ribeiro's work.

For a discussion of the authorship of *Chrisfal* see A. F. G. Bell, *Portuguese Literature* (1922). There is a modern critical edition of *Chrisfal* and a *Carta* (letter) by A. Epiphany da Silva Dias under the title *Obras de Christovão Falcão* (Oporto, 1893), and one of the *Canções* and *Esparsas* by the same scholar appeared in the *Revista Lusitana*, vol. iv., pp. 142–179 (1896), under the name *Fragmento de um Cancioneiro do Século XVI*. See Dr. T. Braga, *Bernardim Ribeiro e o Bucolismo* (Oporto, 1897), and Delfim Guimarães, *Bernardim Ribeiro (O Poeta Crisfal)* (1908).

FALCK, ANTON REINHARD (1777–1843), Dutch statesman, was born at Utrecht on March 19, 1777. He studied at the University of Leiden, entered the diplomatic service, and became ambassador at Madrid. Under King Louis Napoleon he was secretary-general for foreign affairs, but resigned office on the annexation of the Batavian republic to France. He took part in the revolt of 1813 and in the organization of the new kingdom of the Netherlands. He was minister of education and of the colonies under William I., until the king tired of his counsels and sent him as ambassador to London. The disturbances of 1830 convinced him of the necessity of the separation of Belgium from Holland. He consequently resigned his post and lived in close retirement until 1839, when he became the first Dutch minister at the Belgian court. He died at Brussels on March 16, 1843. Besides some historical works he left *Brieven van A. R. Falck, 1795–1843* (2nd ed. The Hague, 1861), and *Ambtsbrieven van A. R. Falck* (*ibid.* 1878). His memoirs were edited by Colenbrander in 1913.

FALCÓN, the most northern State of Venezuela, with an extensive coast-line on the Caribbean sea and Gulf of Venezuela. Pop. (1926) 178,642. It lies between the Caribbean on the north

and the State of Lara on the south, with Zulua and the Gulf of Venezuela on the west. Its surface is much broken by irregular ranges of low mountains, and extensive areas on the coast are sandy plains and tropical swamps. The climate is hot, but, being tempered by the trade winds, is not considered unhealthy except in the swampy districts. The State is sparsely settled and has no large towns, its capital, Coro (pop. 1926, 10,932), being important chiefly because of its history, and as the entrepôt for an extensive inland district. The only port in the State is La Vela de Coro, on a small bay of the same name, 7 m. E. of the capital, with which it is connected by railway. In recent years petroleum has been discovered in the State and is being extracted.

FALCON, the name applied to the long-winged birds of prey which take their quarry as it moves. As in all the group of diurnal birds of prey, the female is larger than the male. As type

THE PEREGRINE FALCON, A COURAGEOUS AND POWERFUL BIRD OF PREY, TRAINED IN EUROPE FOR THE SPORT OF HAWKING

of the family *Falconidae* may be taken the peregrine falcon (*Falco peregrinus*), and the scarcely separable duck-hawk (*F. anatum*) of North America and *F. melanogenys* of Australia. The peregrine falcon inhabits practically every part of the world, except where it is replaced by its allies noticed above. For its size, it is perhaps the most powerful bird of prey that flies, and its courage is as great as its power. Famous in the days of hawking (see **FALCONRY**), the plumage of this bird is blackish-blue above and white with a more or less

deep cream-coloured tinge below, barred, except on the chin and throat, with black. It nests on cliffs and trees, laying four or five eggs mottled with reddish-brown.

The gyrfalcon (*F. gyrfalco*) is larger and inhabits the Scandinavian mountains. The Iceland falcon (*F. islandicus*), which also inhabits South Greenland, is paler, while the Greenland falcon (*F. candicans*) is white with dark streaks. The kindred *F. labradorus* of North-east America is very dark both above and below.

The "desert" falcons differ from the preceding in that they retain the longitudinal barring on the breast throughout life, instead of changing it after the first moult to transverse bars. They include in the Old World the lanner (*F. biarmicus*), the saker (*F. cherrug*) and the lugger, or lugger (*F. jugger*), of India; in the New, the prairie falcon (*F. mexicanus*) of the western plains of North America.

The hobby falcons are characterized by their bold upstanding position and long wings. The beautiful little English hobby (*F. subbeto*) lives mainly on insects and is a summer visitor to most parts of Europe. Many other species are known. See **MERLIN**, **KESTREL**.

A falcon is also a primitive light gun, 2½ in. bore, weighing about 6cwt., and firing a 2lb. shot. It takes its name from the bird of prey in accordance with an old fashion (*Cf.* **FALCONET**, **MUSKET**).

FALCONE, ANIELLO (1600–1656), Italian battle-painter, was born in Naples. He studied under Ribera (Lo Spagnoletto), was influenced by Domenichino and later by the Dutch school. He introduced the new problems of lighting and colour into fresco-painting. There are three authentic works extant. He decorated the cupola of a chapel in San Paolo dei Padri Teatini at Naples. He painted a "Flight into Egypt" in the sacristy of Naples Cathedral (signed and dated 1641); and the frescoes in the sacristy of Gesù Nuovo, also at Naples. He was famous as a battle-painter, two of his battle-pieces being in the Naples museum and in the Prado, Madrid. Some engraved plates are attributed to him without sufficient evidence.

FALCONER, HUGH (1808–1865), British palaeontologist and botanist, was born at Forbes on Feb. 29, 1808. He studied at Aberdeen and at Edinburgh, where he took his M.D. in 1829. Proceeding to Calcutta in 1830 as assistant-surgeon on the Bengal

establishment of the East India Company, he soon published his description of the fossil bones from Ava in the possession of the Asiatic Society of Bengal. In 1831 he was appointed superintendent of the botanic garden of Saharanpur. In 1834 he published a geological description of the Siwalik hills and subsequently brought to light a sub-tropical fossil fauna of unexampled extent and richness, including remains of *Mastodon*, the colossal ruminant *Sivatherium*, and the enormous tortoise *Colossochelys Atlas*. It was on his recommendation in 1834 that tea was introduced into India.

When illness required him to return to England in 1842, he began his *Fauna Antiqua Sivalensis*, of which Part I. was issued in 1846, and 107 plates during the years 1846–49. He was elected F.R.S. in 1845, and in 1847 was appointed superintendent of the Calcutta botanical garden, and professor of botany in the medical college.

In 1850 he published an important report on the teak forests of Tenasserim, and through his recommendation the cultivation of the cinchona bark was introduced into India. From 1855, he spent the remainder of his life in examining fossil species in England and on the Continent corresponding to those found in India, notably the species of mastodon, elephant and rhinoceros; he also described some new mammalia from the Purbeck strata, and he reported on the bone-caves of Sicily, Gibraltar, Gower and Brixham. He died on Jan. 31, 1865.

Falconer's botanical notes, with 450 coloured drawings of Kashmir and Indian plants, were deposited in the library at Kew Gardens, and his *Palaeontological Memoirs and Notes* were edited, with a biographical sketch, by C. Murchison (1868). See also *Essays, descriptive and biographical* (1901) by his niece Lady Prestwich.

FALCONER, WILLIAM (1732–1769), British poet, was born in Edinburgh, the son of a wig-maker. He went to sea, and at the age of 18 was second mate on the "Britannia" when she was wrecked off Cape Colonna. Falconer was one of the three saved. The voyage was the subject of his poem *The Shipwreck* (1762). On his return he published an elegy on Frederick, Prince of Wales, and some poems in the *Gentleman's Magazine*. He dedicated *The Shipwreck* to the Duke of York, who advised him to enter the navy. After the peace of 1763 he became purser of the "Glory" frigate. In 1764 he published a new edition of *The Shipwreck* and *The Demagogue*, an attack on Wilkes and Charles Churchill. In 1769 appeared his *Universal Marine Dictionary*. He was then appointed purser of the "Aurora" frigate, sailing to India. She left Spithead on Sept. 20, 1769, reached the Cape, which she left on Dec. 27, and was never heard of again. *The Shipwreck* had a great reputation in its day, which it has not preserved.

See *Falconer's Poetical Works* (Aldine Edition, 1836), with a life by J. Mitford. *The Shipwreck* (1887) has a life by W. H. D. Adams.

FALCONET, ÉTIENNE MAURICE (1716–1791), French sculptor, was born at Vevey, and died in Paris on Jan. 4, 1791. He was at first apprenticed to a carpenter, but some of his clay-figures attracted the notice of the sculptor Lemoine, who made him his pupil. His statue of Milo of Crotona secured his admission to the Academy of Fine Arts in 1754. At St. Petersburg (Leningrad) he executed a colossal statue of Peter the Great in bronze (1766). In 1788 he became director of the French academy of painting. Falconet's "*Nymphe descendant au bain*" is in the Louvre.

His writings were collected under the title of *Oeuvres littéraires* (6 vols., Lausanne, 1781–82; 3 vols., Paris, 1787).

FALCONIDAE: see **FALCON**; **CARACARA**.

FALCONRY. The art of employing falcons and hawks in the chase, often termed hawking (Fr. *fauconnerie*, from late Lat. *falco*, falcon). Falconry was a favourite recreation of the aristocracy during the middle ages, followed, as it seems, more as a sport than as a means of getting game for the table. The antiquity of falconry is very great. It appears to have been known in China some 2,000 years B.C. In Japan it appears to have been known at least 600 years B.C., and probably at an equally early date in India, Arabia, Persia and Syria. Sir A. H. Layard says that on a bas-relief found in the ruins of Khorsabad "there appeared to be a falconer bearing a hawk on his wrist," from which it would appear

to have been known there some 1,700 years B.C. In all the above mentioned countries of Asia it is practised at the present day.

Persian and Arabic manuscripts attribute the origin of falconry to a pre-historic Persian king; certain it is that the Moguls gave a great impetus to hawking in India. From ancient carvings and drawings it seems to have been known in Egypt many ages ago. The older writers on falconry, English and Continental, often mention Barbary and Tunisian falcons. It is still practised in Egypt. The oldest records of falconry in Europe are in the writings of Pliny, Aristotle and Martial. It was probably introduced into England from the Continent about A.D. 860, and from that time down to the middle of the 17th century, falconry was followed with an ardour that perhaps no English sport has ever evoked. Stringent laws and enactments were passed from time to time in its interest. About the middle of the 17th century its popularity began to decline in England, to revive somewhat at the Restoration; it never however recovered its former favour, a variety of causes operating against it, such as the enclosure of waste lands and the introduction of fire-arms into the sporting field. Yet it has never been even temporarily extinct, and it is practised at the present day.

In Europe the "quarry" at which hawks are flown consists of grouse (confined to the British Isles), black-game, pheasants, partridges, quails, landrails, ducks, teal, woodcocks, snipe, herons, rooks, crows, gulls, magpies, jays, blackbirds, thrushes, larks, hares and rabbits; in former days geese, cranes, kites, ravens and bustards were also flown at. Old German works make much mention of the use of the Iceland falcon for taking the great bustard, a flight scarcely alluded to by English writers. In Asia the list of "quarry" is longer, and in addition to all the foregoing, or their Asiatic representatives, various kinds of bustards, sand grouse, storks, ibises, spoonbills, stone plovers, grass owls, short eared owls, rollers, hoopoes, pea fowl, jungle fowl, kites, vultures and gazelles are captured by trained hawks. In Mongolia and Chinese Tartary, and among the nomad tribes of Central Asia the sport still flourishes; and a species of eagle known locally as the "berkute" is trained in those regions to take large game, such as antelopes and wolves. In a letter from the Yarkand embassy, dated Nov. 27, 1873, the following passage occurs: "Hawking appears to be a favourite amusement, the golden eagle taking the place of the falcon or hawk." In Africa gazelles are taken and also partridges and wild fowl. The hawks used in England are the Greenland, Iceland and Norway falcons, the peregrine falcon, the hobby, the merlin, the goshawk and the sparrow-hawk. In former days the saker, the lanner and the Barbary or Tunisian falcon were also employed. The most efficient in the field are the peregrine falcon and the goshawk. In all species of hawk the female is larger and more powerful than the male.

Hawks are divided by falconers all over the world into two classes. The first class comprises "falcons," i.e., "long winged hawks," or "hawks of the lure." Merlins come into this category; they are undoubtedly falcons. The goshawk was by courtesy sometimes styled a falcon. The second class is that of "hawks," i.e., "short-winged hawks," or "hawks of the fist"; in these the wings are not pointed but rounded.

Training.—It is through the appetite principally that hawks are tamed; but to fit them for use in the field, much patience, gentleness and care are necessary. Slovenly taming necessitates starving, and low condition and weakness are the result. The aim of the falconer should be to have his hawk always keen, and the appetite, when it is brought into the field, should be such as would induce the bird in a state of nature to put forth its full powers to obtain its food, with, as near as possible, a corresponding bodily condition.

The following is a description of the process of training hawks. When first taken, a rufter or easy-fitting hood should be put on her head, and she must be furnished with jesses, swivel, leash and bell; jesses are strips of light leather for the legs. A thick glove or rather gauntlet should be worn on the left hand. (Eastern falconers always carry a hawk on the right.) She must be carried on the fist for several hours at a time, and late into the night, at intervals being gently stroked with a bird's wing or feather. At

"INTERMEWED" FALCON

"Intermewed" peregrine falcon (*Falco peregrinus*) so called because it has moulted in the "mews," where hawks are kept. The transverse markings indicate that the bird has moulted; before moulting they are perpendicular. A moulting hawk is kept in very high condition and at liberty in a room within the "mews"; under these conditions it moults quickly and acquires strong and beautiful plumage

night she should be tied to a perch in a room with the windows darkened, so that no light can enter in the morning. The perch should be a padded one placed across the room about 4½ ft. from the ground with a canvas screen underneath. She will be easily induced to feed, in most cases, by drawing a piece of beef-steak over her feet, brushing her legs at the time with a feather, and now and then, as she snaps at it, slipping a morsel into her mouth. Care must be taken to use a low whistle as she is in the act of swallowing; she will very soon learn to associate this sound with feeding, and it will be found that directly she hears it, she will gripe with her talons and bend down to feel for her food. When the falconer perceives this and other signs of her "coming to," that she no longer starts at the voice or touch, and steps quietly up from the perch when the hand is placed under her feet, it will be time to change her ruffer hood for the ordinary hood. This latter should be an easy fitting one, in which the braces draw closely and yet easily, and without jerking. An old one previously worn is to be recommended. The hawk should be taken into an absolutely dark room, and the change should be made if possible in total darkness. After this she must be brought to feed with her hood off; at first she must be fed in a darkened room, more light being admitted as she is able to bear it. The first day, the hawk having seized the food, and begun to pull at it freely, the hood may be gently slipped off, and after she has eaten a moderate quantity, it must be replaced as slowly and gently as possible, and she should be allowed to finish her meal through the hood. Next day the hood may be twice removed, and so on; day by day the practice should be continued, more light being gradually admitted, until the hawk will feed freely in broad daylight, and suffer the hood to be taken off and replaced without opposition. She must now be accustomed to see strangers, dogs, horses, etc., and to feed in their presence. A good plan is to take her into the streets of a town at night, at first where the gas-light is not strong, unhooding and hooding her from time to time, but not letting her get frightened. Up to this time she should be fed on lean beef-steak with no casting, but as soon as she is tolerably tame and submits well to the hood, she must occasionally be fed with pigeons and other birds. This should be done not later than 3 or 4 P.M., and when she is placed on her perch for the night in the dark room, she must be unhooded and left so, of course, being carefully tied up. The falconer should enter the room about 7 or 8 A.M. next day, admitting as little light as possible, or using a candle. He should first observe if she has thrown her casting; if so, he will at once take her to the fist, giving her a bite of food and rehooding her. If her casting has not been thrown up it is better for him to retire, leaving the room quite dark, and come in again later. He should leave her unhooded until such time as she has "cast."

She must now be taught to recognize the voice—the shout that is used to call her in the field—and to jump to the fist for food, the voice being used every time she is fed. When she comes freely to the fist she must be made acquainted with the lure. Kneeling down with the hawk on his fist, and gently unhooding her, the falconer casts out the lure, which may be either a dead pigeon, or an artificial lure garnished with beef-steak tied to a string, to a distance of a few feet in front of her. When she jumps down to it, she should be allowed to feed a little upon it—the voice being used—while occasionally receiving morsels from the falconer's hand; and before her meal is finished she must be taken up on to the hand, being induced to forsake the lure for the hand by offering her a piece of meat. This treatment will help to check her inclination hereafter to carry her quarry. This lesson is to be continued till the falcon feeds boldly on 'he lure on the ground in the falconer's presence—till she will allow him to walk round her while she is feeding. All this time she will have been held by the leash only, but in the next step a strong, but light creance—a line attached to the swivel—must be made fast to the leash, and an assistant holding the hawk should unhood her, as the falconer, standing at a little distance from her, calls her by shouting and casting out the lure.

Day by day the distance will be increased, until the hawk will come 30, 60, 100 yds. and so on without hesitation: then she

may be trusted to fly to the lure at liberty and by degrees from any distance, say 200 yards. This accomplished she should learn to stoop at the lure. Instead of allowing the hawk to seize upon it as she comes up the falconer will snatch the lure away and let her pass by, and immediately put it out that she may readily seize it when she turns round to look for it. This should be done at first only once, and then progressively, until she will stoop backwards and forwards at the lure as often as desired. Next she should be entered to her quarry. Should she be intended for rooks or herons, two or three of these birds must be procured. One should be given her from the hand, the next released close to her, and the third at a considerable distance. If she takes these keenly she may be flown at a wild bird, care must, however, be taken to let her have every possible advantage in her first flights—wind and weather, and the position of the quarry with regard to the surrounding country being an important consideration.

Eyasses, on being received by the falconer before they can fly must be put into a sheltered place, such as an outhouse or shed. The basket or hamper should be filled with straw. A hamper is best, with the lid so placed as to form a platform upon which the young hawks can come out to feed. This should be fastened to a beam or prop a few feet from the ground. The young hawks must be plentifully fed on the best fresh food obtainable—such as good lean beef and fresh killed birds and rabbits. The food should be securely tied in separate portions to a board, or better to wooden blocks, one for each hawk. At this stage the young hawk should be interfered with as little as possible. The falconer should place the food down for them and then retire as quickly as possible. The wilder and more independent they become during the period of "hack" the better. As they grow older they will come out and perch about the roof of their shed, by degrees extending their flights to neighbouring buildings or trees, never failing to come back at feeding time to the place where they are fed. Soon they will be continually on the wing, soaring up and playing with one another, and later the falconer will observe them chasing other birds, such as pigeons or rooks, which may be passing by. As soon as a young hawk fails to return to the hack for its meal a note should be made of its absence, and it should at once be caught in a bow net or snare the first time it comes back, or it may absent itself for good. It must be borne in mind that the longer hawks can be left out "at hack" the better they are likely to be in the field—those hawks being always the best which have preyed a few times for themselves when "at hack." There is, of course, a great risk of losing hawks altogether when they begin to prey for themselves, but this is a matter for the falconer's judgment. When a hawk is so caught she is said to be "taken up" from hack. Being an eyas, she will not require a ruffer hood, but a good deal of the management as directed for the passage falcon will be necessary in her case also. She must be carefully tamed and broken to the hood in the same manner, and also taught to know the lure; but, as might be expected, very much less difficulty will be experienced. As soon as the eyas knows the lure sufficiently well to come to it sharp and straight from a distance, she must be taught to "wait on." This is effected by letting the hawk loose, choosing the most open space available. It will be found that she will circle round the falconer looking expectantly for the lure—perhaps mount a little in the air, and advantage must be taken of a favourable moment when the hawk is at a little height, her head being turned inwards towards the falconer, to loose a pigeon with shortened wings which she can easily catch. When the hawk has taken two or three pigeons in this way, and mounts into the air immediately in expectation, in short, begins to "wait on," she should be given no more pigeons, but be tried at game as soon as possible. The young hawk must be given every possible advantage when first flown at wild quarry, as, upon the success or failure of these early attempts, her subsequent career of usefulness chiefly depends.

The training of the great northern falcons, as well as that of merlins and hobbies, is conducted much on the above principles, but the jer-falcons will seldom "wait on" well, and merlins will

not do so at all.

The training of short-winged hawks is a simpler process. They must, like falcons, be provided with jesses, swivel, leash and bell. In these hawks the bell is sometimes fastened to the tail. Sparrow-hawks can, however, scarcely carry a bell big enough to be of any service. The hood is seldom used for short-winged hawks—never in the field. They must be made as tame as possible by carriage on the fist and the society of man, and taught to come to the fist freely when required—at first to jump to it in a room, and then out of doors. When the goshawk comes freely and without hesitation from short distances, she would be called from longer distances from the hand of an assistant, but not oftener than twice in each meal, until she will come several hundred yards, on each occasion being well rewarded with some favourite food such as fresh killed birds. When she does this freely, and endures the presence of strangers, dogs, etc., a few bagged rabbits may be given to her, and she will be ready to take the field. Some accustom the goshawk to the use of the lure, for the purpose of recovering her if she refuses to come to the fist in the field, when she has taken stand in a tree after being baulked of her quarry, but this is not a good practice.

Methods of Hawking.—Falcons or long-winged hawks are either "flown out of the hood" (*i.e.*, unhooded and slipped when the quarry is in sight), or they are made to "wait on" till game is flushed. Herons and rooks are always taken by the former method. Passage hawks are generally employed for flying at these birds, though good eyasses are occasionally equal to the work.

For heron hawking a well stocked heronry is essential, adjoining an open country (with no adjacent water) over which the herons are in the constant habit of passing on their fishing excursions, or making their "passage." A heron found at his feeding place at a brook or pond affords no sport whatever. A goshawk can then take him as he rises, before he can get well on the wing. It is quite a different affair when he is sighted winging his way high in the air over an open tract of country free from water. Though he has no chance in competing against a falcon in straightforward flight, the heron has large concave wings, and a proportionately light body, and he can rise with astonishing rapidity, more perpendicularly or, in other words, in smaller rings than the falcon can and with less effort. As soon as he sees the approach of the falcon, he makes for the upper regions. The falcon then commences to climb to get above him, but in a very different style. She makes wider circles or rings, travelling at a higher rate of speed, due to her strength, weight and power of flying, till she rises above the heron. Then she makes her attack by stooping with great force at the quarry, sometimes falling so far below him that she cannot shoot up to a sufficient pitch for the next stoop, and has to make another ring to regain her lost command over the heron, which is ever rising, and so on—the "field" meanwhile galloping in the direction the flight is taking, till the falcon seizes the heron aloft, "binds" to him, and both come to the ground together. Absurd stories have been told, and pictures drawn, of the heron receiving the falcon on its beak in the air. It is, however, well known to all practical falconers that the heron has neither the power nor the inclination to use his beak in the air; so long as he is flying he relies solely on his wings for safety. When on the ground, however, the heron may use his dagger-like bill with dangerous effect, though it is very rare for a falcon to be injured. Old experienced hawks generally let go the heron on nearing the ground, "binding" to him again immediately he reaches it in his fall. Rooks are flown in the same manner as herons, but the flight is generally inferior. In Europe a cast of falcons was always flown at a heron. It was the practice to ride in and release the heron when he was taken, if uninjured the long plume of feathers at the back of his head being removed and kept as a trophy. The last establishment for heron hawking in Europe was maintained at the Loo in Holland, with H.R.H. Prince Alexander of the Netherlands as its president, between the years 1840 and 1850. This establishment was called the Loo Hawking Club and included several English members.

For game-hawking eyasses are generally used, though undoubt-

edly passage or wild caught hawks are to be preferred. The best game hawks we have seen have been passage hawks, but there are difficulties attending their use. It may perhaps be fairly said that passage hawks can be trained to "wait on" in grand style, but until they have got through their first season, they are more liable to be lost than eyasses. The advantages attending the use of eyasses may be summed up as follows: they are easier to obtain, to train and to keep; they moult more regularly than passage hawks, and if lost in the field they will often return home by themselves, or remain in the country where they are accustomed to be flown. Experience and, we must add, some good fortune also are requisite to make eyasses good for "waiting on" at game. Slight mistakes on the part of the falconer, false points from dogs, or bad luck in serving, will cause a young hawk to acquire bad habits, such as sitting down on the ground, taking stand in a tree, raking out wide, skimming the ground, or lazily flying round at an insufficient altitude. A good game hawk in proper flying order mounts rapidly to a high pitch until she appears no larger than a swallow in the sky, keeping well over the falconer and dogs, and ready to stoop when the quarry is sprung. Hawks that have been successfully trained and judiciously worked become wonderfully clever, and soon learn to regulate their flight by the movements of their master. Eyasses were not held in esteem by the old falconers, and it is evident from their writings that these hawks have been much better understood and managed in modern times than in the middle ages. It is probable that the old falconers procured the wild-caught hawks with greater facility than at the present day. There was a hawk mart held at Valkenswaard in Holland, where hawks were sold after the annual catch during the autumn migration. It was visited by falconers from all over Europe, large sums being often paid at auction for particularly choice birds.

Here may be quoted a few lines from one of the best of the old writers, which may be taken as giving a fair account of the estimation in which eyasses were generally held, and from which it is evident that the old falconers did not understand flying hawks "at hack." Symon Latham, writing in 1633, says of eyasses: "They will be verie easily brought to familiaritie with the man, not in the house only, but also abroad, hooded and unhooded; nay, many of them will be more gentle and quiet when unhooded than when hooded, for if a man doe but stirre or speake in their hearing, they will crie and bate as though they did desire to see the man. Likewise some of them being unhooded, when they see the man will cower and crie, showing thereby their exceeding fondness and fawning love towards him. . . . These kind of hawks which are (for the most part) taken out of the nest while verie young, even in the downe, from whence they are put into a close house, whereas they be alwaies fed and familiarly brought up by the man, untill they bee able to flie, when as the summer approaching verie suddenly they are continued and trained up in the same, the weather being alwaies warm and temperate; thus they are still inured to familiaritie with the man, not knowing from whence besides to fetch their relief or sustenance. When the summer is ended they bee commonly put up into a house again, or else kept in some warm place, for they cannot endure the cold wind to blow upon them. . . . But leaving to speak of these kind of scratching hawks and I never did love should come too neere my fingers, and to return unto the faire conditioned haggard faulcon. . . ."

The author here describes with accuracy the condition of unhacked eyasses which no modern falconer would trouble himself to keep. Many English falconers in modern times have owned eyasses which have killed grouse, ducks, and other quarry in a style almost equalling that of passage hawks. Moors, downs, open country where the hedges are low and weak, are best suited to game-hawking. Pointers or setters may be used to find the game, or the hawk may be loosed on reaching the ground where game is known to lie, and suffered, if an experienced one, to "wait on" till it is flushed. However, the best plan with most hawks, young ones especially, is to use a dog, and to "cast off" the hawk when the dog points, and to flush the birds as soon as the hawk has reached her pitch. The hawk should be well over the birds, and if

possible a little up-wind of them when they rise, she will then be better placed for a down-wind stoop, as the game will not dare to fly up-wind under the hawk. The hawk will then turn over, and, flying headlong downwards with incredible speed, will, with the gathered impetus of her fall from the sky, rapidly overtake the bird she has from the first moment selected as her victim. As she reaches it, she strikes it a heavy blow with the hind talon of her foot, and the bird falls to the ground, often stone-dead, leaving a cloud of feathers in its track, or, just as she rushes up to it, the quarry may evade the stroke by a clever shift, and hurl itself into the nearest cover before the hawk has recovered from her stoop. The falconer will then come up as quickly as possible to "serve" the hawk by putting the bird out again while she "waits on" overhead. If this be successful, she is nearly certain to kill at the second attempt. Falcons, being larger and stronger, are to be preferred for grouse and tiercels for partridges. Woodcock afford capital sport where the country is sufficiently open; it will generally be found that after the first stoop at a woodcock, the cock will try to escape by taking the air, and will show a very fine flight. When beaten in the air it will try to get back to covert again, but when once a hawk has out-flown a woodcock, he is pretty sure to kill it. Snipe may be killed with first-class tiercels in favourable localities. Wild duck and teal are only to be flown at when they can be found in small pools or brooks at a distance from large sheets of water—where the fowl can be suddenly flushed by men or dogs, while the falcon is flying at her pitch overhead. For duck falcons should be used; tiercels will kill teal well. The merlin is used for flying at larks, and there does not seem to be any other use to which this pretty little falcon may fairly be put. It is very active, but far from being, as some authors have stated, the swiftest of all hawks. Its flight is greatly inferior in speed to that of the peregrine. The hobby is swifter than the merlin, but cannot be said to be efficient in the field; it may be trained to "wait on" beautifully, and will take bagged larks: it is much addicted to the fault of "carrying."

The three great northern falcons are not easy to procure in proper condition for training. They are difficult to break to the hood and to manage in the field. They can be flown, like the peregrine, at herons and rooks, and in former days were used for kites and hares. Their style of flight is magnificent; they are swifter than the peregrine, and are deadly "footers." They seem, however, to lack somewhat of the spirit and dash of the peregrine.

For the short-winged hawks an open country is not required; they may even be flown in a wood. Goshawks are used for hares, rabbits, pheasants, partridges and wild-fowl. Only very large and strong females are able to take hares; rabbits are easy quarry for any female goshawk and also for some males. For pheasants the male is to be preferred, and certainly for partridges; either sex will take duck, but the falconer must get close to them before they are flushed, or the goshawk will stand a poor chance of killing. Rabbits may be bolted with the ferret, and the hawk loosed as the rabbit bolts, but care must be taken that she does not kill the ferret. Where rabbits sit out in grass or in turnip fields, a goshawk may be used with success, or even in a wood where the burrows are not too near. For various reasons goshawks in England cannot be brought to the perfection to which they are brought in the East. In India, for instance, there is a far greater variety of quarry suited to them, and wild birds are much more approachable; moreover, there are advantages for training which do not exist in England. Unmolested, the Eastern falconer carries his hawk by day and night in the crowded bazaars, till the bird becomes perfectly indifferent to men, horses, carriages.

The management of sparrow-hawks is much the same as that of goshawks, but they are more delicate. They are flown in England at blackbirds, thrushes and other small birds; the best will take partridges well early in the season. In the East a large number of quail are taken with sparrow-hawks. In India falconry, until quite recently, has always been a flourishing art. Indian falconers far surpass Persians and Arabs. Eyasses are not used, and the system of flying "at hack" is unknown. Hawks are caught on the passage, manned and trained to the lure in a wonderfully short time, but very seldom is a falconer to be found

who can maintain hawks in good flying condition. In the Punjab, sakers are the falcons chiefly used; haggard and young passage hawks are flown at hares and hubara. Successful falconers get these sakers into good wind by daily exercise at the lure, giving them about 25 stoops in the morning, and about the same number in the evening. They are then kept fit by daily stooping to the lure. Arab falconers omit this exercise altogether, and keep their hawks in such poor condition that they are unable to kill hubara on the wing. Their hawks follow the quarry in the open desert, and when it settles, kill after a rough and tumble on the ground. During the last 30 years falconry has nearly died out in India, though a fair number of goshawks are still kept. Between the hours of 11 A.M. and 3 P.M. hawking in the desert is difficult on account of eagles, which interfere with the hawks, and rob them of their quarry. Pariah dogs too are liable to be a nuisance. Sakers, both haggard and young passage falcons, used also to be flown at kites. One flight each alternate day was usually considered sufficient, as this was a very tiring flight for the hawks. As kites are generally found in the vicinity of villages, and when pursued make for shelter in a village, kite-hawks generally come to an untimely end, being attacked by pariah dogs, or knocked in the head by the villagers themselves.

Hawks from which work in the field is expected should be kept in the highest health, and they must be carefully fed; no bad or tainted meat must be given to them. Peregrines and the great northern falcons are best kept on lean beef-steak with a frequent change in the shape of fresh killed pigeons and other birds. Freshly killed rabbits are a change to a lighter diet. The smaller falcons, the merlin and the hobby, require small birds to keep them in health. For goshawks a coarser diet, such as rats or rabbits, suffices. The sparrow-hawks, like the small falcons, require small birds. All hawks need to be given castings. Hawks will exist, and often appear to thrive, on good food without castings, but the seeds of future injury to their health are being sown. If it is more convenient to feed the hawks on beef-steak, they should frequently be given the wings, heads and necks of game and poultry, with the blood carefully removed. In addition to the castings which they swallow, tearing the pinion joint of a wing is good exercise for them, and biting the bones keeps their beaks in good trim. Most hawks, peregrines especially, require a bath. The end of a cask sawn to give a depth of about 6 in. makes a good bath. Peregrines which are used for "waiting on" require a bath at least twice a week. If this be neglected, they are when flown inclined to soar, and may even rake away in search of water, and so be lost.

The best way, where practicable, of keeping hawks, is to tether them to blocks on the lawn. Goshawks are generally placed on bow perches, which ought not to be more than 8 or 9 in. high at the centre of the arc. It will be several months before passage or wild-caught falcons can be kept out of doors; they must be fastened to a perch in a darkened room, hooded, and, by degrees, as they get tamer, they may be put out on the lawn. In England (especially in the south) peregrines, the northern falcons and goshawks may be kept out of doors all day and night in a sheltered situation. Merlins, being more delicate, should be given more protection. In wild boisterous weather, or in snow or sharp frost, it would be advisable to move them to the shelter of a shed, the floor of which should be laid with sand to a depth of 3 or 4 inches. An eastern aspect is best—all birds enjoy the morning sun and it is beneficial to them. The more hawks confined to blocks out of doors see of persons, dogs, horses, etc., moving about, the better. Those who have only seen wretched ill-fed hawks in cages, pining for exercise, with battered plumage, torn shoulders, and bleeding ceres, from dashing against their prison bars, and with overgrown beaks from never getting bones to break, can have little idea of the beautiful and noble-looking birds to be seen pluming their feathers and stretching their wings at their ease on their blocks on the lawn, watching with their large, bright, keen eyes everything that goes on in the sky, and everywhere else within their view.

Contrary to the prevailing notion, hawks that have been well handled show a good deal of attachment to their owners. It is

true that by hunger they are in great measure tamed and controlled, and the same may be said of many undomesticated and many domesticated animals. Instinct prompts all wild creatures when away from man's control to return to their former shyness, but hawks certainly retain their tameness for a long time, and their memory is remarkably retentive. Wild-caught hawks have been retaken either by their coming to the lure, or upon quarry, from two to seven days after they have been lost, and eyasses from two to three weeks. As an instance of retentiveness of memory displayed by a hawk we may mention the case of a wild-caught falcon which was recaptured after being at liberty more than three years, still bearing the jesses which she wore at the time she was released; in five days she was flying at the lure again at liberty, and was found to retain the peculiar ways and habits of a trained hawk. It is useless to bring a hawk into the field unless she has a keen appetite; if she has not, she will neither hunt effectually nor follow her master. Even wild-caught falcons, however, may sometimes become so attached to their owner that, when sitting on their blocks with food in their crops, they will, on seeing him, "bate" hard to get to reach him, till he either allows them to jump up to his hand, or withdraws from their sight. Goshawks too evince great attachment to their owner. Another error is that hawks are lazy birds, requiring hunger to stir them to action. The reverse is the truth; they are birds of very active habits, and exceedingly restless. The wild falcon requires an immense amount of exercise to enable her to exert her speed and power of flight; instinct prompts her to spend hours daily on the wing, soaring and playing about in the air in all weathers, often chasing birds merely for play. When full gorged she takes a siesta; but unless she fills her crop late in the evening she is soon on the move again. Goshawks and sparrow-hawks, too, habitually soar in the air at about 9 or 10 A.M., and remain aloft a considerable time, but these birds are not so active as the falcons. The frequent "bating" of tame hawks proves their restlessness and impatience of repose. So does the wretched condition of the caged falcon, while the truly lazy buzzards and kites, which do not in the wild state depend upon their activity for their sustenance, maintain themselves for years even during confinement in good case and plumage. The falconer, therefore, should endeavour to give his hawks as much flying as possible, and he should avoid the mistake of keeping too many hawks. In this case a favoured few are sure to get all the work, and the others, possibly equally good, were they given the chance, are spoilt for want of exercise.

The larger hawks may be kept in health and working order for many years. The writer has known peregrines, shaheens and goshawks to reach ages of 15 and 20 years. Goshawks, however, never fly well after four or five seasons, when they will no longer take difficult quarry; they may be used for rabbits as long as they live. Shaheens have been seen in the East at an advanced age, killing wild-fowl beautifully. The shaheen is a falcon of the peregrine type, but smaller, which does not travel, like the peregrine, all over the world. It appears that the jer-falcons also may be worked to an advanced age. Old Symon Latham tells us of these birds—"I myself have known one of them an excellent hearnor (killer of herons) and to continue her goodnesse very neere twentie yeeres, or full out the time."

(E. D.-RA.)

HAWKING IN MODERN ENGLAND

The Old Hawking Club.—The survival of falconry in England is due mainly to the influence of the Old Hawking Club. This club was formed by a few gentlemen in 1864 and continued in being until 1925; it came to an end for various causes, the first of which was the World War. The principal sport of this club was rook hawking on the Wiltshire downs during the spring, but every description of hawking has also been indulged in. The hawks principally used were passage hawks, and a draft of from eight to ten freshly caught peregrines was annually brought over from Valkenswaard in Holland in the autumn, and trained for rook hawking in the following spring. Some of these, in conjunction with eyasses, were flown at partridges and grouse in the autumn. The objects of this club have ever been to promote

falconry—first, by keeping up a first-class establishment of hawks; secondly, to train lads as falconers under an able man; and thirdly, by drafting out at the end of each season all but a few favourites, to maintain a supply of well trained hawks.

In addition to the club a few private establishments have always been maintained, where the best traditions of the sport have been kept up. The place of the Old Hawking Club has now been taken by the British Falconers' Club. (D. C. P.)

FALDSTOOL, properly a folding seat for the use of a bishop when not occupying the throne in his own cathedral, or when officiating in a cathedral or church other than his own; hence any movable folding stool used for kneeling in divine service.

FALERII, one of the twelve chief cities of Etruria (mod. *Civiltà Castellana* [q.v.]), situated about 2 m. W. of the ancient Via Flaminia, 32 m. N. of Rome. Wars between Rome and the Falisci (q.v.) appear to have been frequent. At the end of the First Punic War, they rose in rebellion, but were soon conquered (241 B.C.) and lost half their territory. The ancient city, built upon a precipitous hill, was destroyed and another built on a more accessible site in the plain. Thus the original city occupied the site of the present Civita Castellana, and the Roman town was transferred 3 m. to the north-west. After this time Falerii hardly appears in history. There were bishops of Falerii up till 1033, when the desertion of the place in favour of the present site began, and the last mention of it dates from A.D. 1064.

The site of the original Falerii is a plateau, about 1,100 yd. by 400, not higher than the surrounding country (475 ft.) but separated from it by gorges over 200 ft. in depth, and only connected with it on the western side, which was strongly fortified with a mound and ditch; the rest of the city was defended by walls constructed of rectangular blocks of tufa, of which some remains still exist. Remains of at least four temples have been excavated. These buildings were of wood, with fine decorations of coloured terra cotta (see Taylor and Bradshaw in *Papers of the British School at Rome* viii. 1 sqq.). Numerous tombs hewn in the rock are visible on all sides of the town; many objects, both from the temples and from the tombs, are in the Museo di Villa Giulia at Rome. The site of the Roman Falerii is now entirely abandoned. It lay upon a road which may have been the Via Annia, a by-road of the Via Cassia; this road approached it from the south passing through Nepes, while its prolongation to the north certainly bore the name Via Amerina. The circuit of the city is about 2,250 yd., its shape roughly triangular, and the walls are a remarkably fine and well-preserved specimen of Roman military architecture. They are constructed of rectangular blocks of tufa and reach in places a height of 56 ft. and are 7 to 9 ft. thick. There were about 80 towers, some 50 of which are still preserved. Two of the gates also, of which there were eight, are noteworthy. Almost the only edifice now standing within the walls is the 12th-century abbey church of S. Maria.

See G. Dennis, *Cities and Cemeteries of Etruria* (London, 1883), i. 97; for philology and ethnology see FALISCI. (T. A.)

FALERIO (mod. *Falerone*), an ancient town of Picenum, Italy, about 10 m. S.E. of Urbs Salvia, which, from the remains

HAWKS AND FALCONS

1. Immature eyas tiercel, used for game hawking. An eyas is a hawk which has been trained from the nest. The male of any hawk, being a third smaller than the female, is called *tiercel*. 2. A cast (male and female) of merlins, on a lark which they have killed. Merlins are flown only at larks. 3. An adult eyas tiercel. A hawk is considered adult after the first moulting, when the marking of the plumage becomes horizontal instead of perpendicular. Tiercels are best used for partridges, magpies and gulls. Only the largest can kill grouse. 4. A female goshawk, flown at hares, rabbits or pheasants, shown sitting by a rabbit she has just caught. 5. Hooded falcons on the cadge, a wooden frame on which hawks

are transported to and from the field. Their vision is cut off by leather hoods to ensure their sitting still. 6. Jack merlin, or male. The female is called the merlin. 7. An eyas peregrine tiercel (see fig. 3). This bird killed 504 head of game, principally partridge and grouse, in eight years. 8. Haggard peregrine falcon, the bird most successfully used in falconry. *Haggard* signifies a hawk caught wild in adult plumage. 9. A gerfalcon of the Greenland variety, the largest of the falcons. Modern falconers have not been successful in training this bird, having found it difficult to keep it in health and condition.

BY COURTESY OF CAPTAIN C. W. R. KNIGHT

BUZZARD SUCCESSFULLY TRAINED FOR FALCONRY

A buzzard (*Buteo vulgaris*), from Exmoor, Devonshire, which was trained for falconry as an experiment and acquitted itself satisfactorily in the field. This bird is generally considered useless for the practice of falconry, since in speed, courage and perseverance it is vastly inferior to other birds of prey

of its buildings, appears to have been of some importance. It was probably founded as a colony by Augustus after his victory at Actium. Considerable remains of a theatre in concrete faced with brickwork, erected, according to an inscription, in 43 B.C., and 161 ft. in diameter, were excavated in 1838 and are still visible; an amphitheatre, less well preserved, also exists, the arena of which measures about 180 by 150 ft. Between the two is a water reservoir (called Bagno della Regina) connected with remains of baths.

FALGUIÈRE, JEAN ALEXANDRE JOSEPH (1831-1900), French sculptor and painter, was born at Toulouse on Sept. 7, 1831. A pupil of the École des Beaux Arts he won the *Prix de Rome* in 1859; he became a member of the Institute in 1882. His "Victor of the Cock-Fight" (1864), and "Tarcisus the Christian Boy-Martyr" (1867) are now in the Luxembourg. His more important monuments are those to Admiral Courbet (1890) at Abbeville and the famous "Joan of Arc." His "Triumph of the Republic" (1881-86), a vast quadriga for the Arc de Triomphe, Paris, is perhaps more amazingly full of life than others of his works, all of which reveal this quality of vitality in superlative degree. To these works should be added his monuments to "Cardinal Lavignerie" and "General de La Fayette" (the latter in Washington), and his statues of "Lamartine" (1876) and "St. Vincent de Paul" (1879), as well as the "Balzac," which he executed for the *Société des gens de lettres* on the rejection of that by Rodin; and the busts of "Carolus-Duran" and "Coquelin cadet" (1896). He died in Paris on April 19, 1900. Falguière was a painter as well as a sculptor. Of his paintings "The Wrestlers" (1875) and "Fan and Dagger" (1882; a defiant Spanish woman) are in the Luxembourg.

See Léonce Bénédite, *Alexandre Falguière* (1902).

FALIERI, MARINO (1279-1355), doge of Venice, belonged to one of the oldest and most illustrious Venetian families and had served the republic with distinction in various capacities. In 1346 he commanded the Venetian land forces at the siege of Zara, where he was attacked by the Hungarians under King Louis the Great and totally defeated them; this victory led to the surrender of the city. In Sept. 1354, while absent on a mission to Pope Innocent IV. at Avignon, Falieri was elected doge, an honour which apparently he had not sought. His reign began, as it was to end, in disaster, for very soon after his election the Venetian fleet was completely destroyed by the Genoese off the island of Sapienza, while plague and a declining commerce aggravated the situation. Falieri fretted under the constitutional restrictions of the ducal power, and the discontent of the arsenal hands at their treatment by the nobles offered him his opportunity. In concert with a sea-captain named Bertuccio Ixarella (who had received a blow from the noble Giovanni Dandolo), Filippo Calendario, a stonemason, and others, a plot was laid to murder the chief patricians on April 15 and proclaim Falieri prince of Venice. The Council of Ten arrested the ringleaders; several of the conspirators were condemned to death and others to various terms of imprisonment. The doge was himself arrested; at the trial he confessed everything, and was condemned and executed on April 17, 1355.

See Horatio Brown, *Studies in Venetian History* (1907, with bibliography).

FALISCI, a tribe of Sabine origin or connections, but speaking a dialect closely akin to Latin, who inhabited the town of Falerii (*q.v.*), as well as a considerable tract of the surrounding country, probably as far south as Capena. But at the beginning of the historical period (*i.e.*, from the beginning of the 5th century B.C.), and no doubt earlier, the dominant element in the town was Etruscan; and all through the wars of the following centuries the town was counted a member, and sometimes a leading member, of the Etruscan league (*cf.* Livy iv. 23, v. 17, vii. 17).

The Faliscans show many traces of their Italic origin, above all in their language, which is preserved in some 36 short inscriptions, dating from the 3rd and 2nd centuries B.C., written from right to left in a peculiar alphabet derived from the Etruscan, with some traces of the influence of the Latin alphabet.

The phonetic characteristics of the Faliscan dialect are:—

1. The retention of medial *f* which in Latin became *b*;

2. The representation of an initial Ind.-Eur. *gh* by *f* (*foied*, contrast Latin *hodie*);

3. The palatalization of *d*+consonant *i* into some sound denoted merely by *i*—the central sound of *foied*, from *fo-diēd*;

4. The loss of final *s*, at all events before certain following sounds (*cra* beside Latin *crās*).

Other characteristics, appearing elsewhere, are:

5. The retention of the velars (Fal. *quando*=Latin *quando*; contrast Umbrian *pan(n)u*);

6. The assimilation of some final consonants to the initial letter of the next word:

It seems probable that the dialect lasted on, though being gradually permeated with Latin, till at least 150 B.C.

The remains found in the graves (*see* FALERI), which belong mainly to the period of Etruscan domination, give ample evidence of material prosperity and refinement. The earlier strata have yielded more primitive remains from the Italic epoch. A large number of inscriptions consisting mainly of proper names may be regarded as Etruscan rather than Faliscan.

See W. Deecke, *Die Falisker*; E. Bormann, in *C.I.L.* xi. pp. 465 ff.; and R. S. Conway, *Italic Dialects*.

FALK, ADALBERT (1827-1900), German politician, was born at Matschkau, Silesia, on Aug. 10, 1827. In 1847 he entered the Prussian state service, and in 1853 became public prosecutor at Lyck. From 1872 to 1879 he was minister of education, and in connection with Bismarck's policy of the *Kultur-kampf* he was responsible for the famous May Laws against the Catholics (*see* GERMANY: *History*). He retained his seat in the *Reichstag* till 1882, when he was made president of the supreme court of justice at Hamm. He died on July 7, 1900.

See H. R. Fischer, *Adalbert Falk* (1901).

FALK, JOHANN DANIEL (1768-1826), German author and philanthropist, was born at Danzig on Oct. 28, 1768. In 1813 he established a philanthropic society (*Gesellschaft der Freunde in der Not*), one of the earliest of its kind, and about the same time founded an institute for the care and education of neglected and orphan children, which, in 1829, was taken over by the State and still exists as the *Falksches Institut*. Falk lived at Weimar, and enjoyed the acquaintance and intimate friendship of Goethe; his account of their intercourse was posthumously published under the title *Goethe aus näherem persönlichen Umgang dargestellt* (1832) (English translation by S. Austin). Falk died on Feb. 14, 1826.

Falk's *Satirische Werke* appeared in 7 vols. (1817 and 1826); his *Auserlesene Schriften* (3 vols., 1819). See *Johannes Falk: Erinnerungsblätter aus Briefen und Tagebüchern* edited by his daughter, (1868); Heinzelmann, *Johannes Falk und die Gesellschaft der Freunde in der Not* (1879); S. Schultze, *Falk und Goethe* (1900).

FALKE, JOHANN FRIEDRICH GOTTLOB (1823-1876), German historian, was born at Ratzeburg on April 10, 1823. In 1856 he was appointed secretary of the German museum at Nuremberg, and in 1859 keeper of the manuscripts. With the aid of the manuscript collections in the museum he studied economic history, and, with Johann H. Müller, established an historical journal, *Zeitschrift für deutsche Kulturgeschichte* (4 vols., Nuremberg, 1856-59). To this journal he contributed a history of German taxation and commerce. In 1862 he became secretary and, later, keeper of the State archives at Dresden. His works include: *Geschichte des deutschen Handels* (2 vols., 1859-60); *Die Hansa als deutsche See- und Handels-macht* (1862), and *Geschichte des deutschen Zollwesens* (1869). He died at Dresden on March 2, 1876.

FALKENHAYN, ERICH VON (1861-1922), Prussian general, was born on Nov. 11, 1861 at Burg Belchau (Thorn). He took part in the China expedition of 1900 and remained in China with a brigade of occupation until 1903. In 1907 he was appointed chief of staff of the XVI., and in 1912 of the IV. Army Corps. In 1911 he was appointed commander of the 4th Guards (infantry) regiment. In 1913 he was made general, and from July 7, 1913 to Jan. 20, 1915 was Prussian war minister. He succeeded General von Moltke on Nov. 3, 1914 as chief of the general staff of the army. Although Falkenhayn did not accept the principle that a decision could be obtained in the East, the

abandonment of the plan for a break-through on the Albert-Arras front, and the increasing evidence of shortage of material and weakening efficiency on the Russian side made him regard a very heavy blow on the Russian front as necessary and desirable. Eight divisions were brought from the Western front, and Mackensen was made chief of this army (XI.), which succeeded in breaking through the Russian lines (Gorlice-Tarnow) on May 2-3, 1915 (see WORLD WAR). Falkenhayn later helped to plan the summer offensive of 1915 against Russia. At the end of 1915 he became convinced of the necessity of opening a road to Turkey for the transit of munitions and expert personnel, and organized the operations by which, with the co-operation of the Bulgarian army, Serbia was over-run in the winter of 1915-16. At the end of Dec. 1915, Falkenhayn sent the Kaiser a memorandum setting forth his reasons for advocating an attack on Verdun (see VERDUN, BATTLES OF), and he was severely blamed when the attack eventually failed.

In July 1916, Falkenhayn, submitting to public opinion, proposed that Field-Marshal von Hindenburg should be made supreme commander from Pripet to the Dniester, and a few days later he offered him the command of the whole eastern front from the Baltic to the Carpathians. The desire for the creation of a general supreme command was rapidly growing even in Austria, and on Sept. 16, 1916 the *Oberste Kriegsleitung* was signed by German and Austrian plenipotentiaries; under this agreement the German Kaiser became responsible for the higher leading of operations in general. It was signed on the part of the Germans by von Hindenburg, who had succeeded Falkenhayn as new chief of the General Staff on Aug. 29, 1916, the immediate cause of Falkenhayn's dismissal being the Rumanian declaration of war (Aug. 27, 1916). Falkenhayn was then assigned the leadership of the IX. Army against Rumania and commanded in the fighting at Hermannstadt and on the Targu Jin (see RUMANIA: Defence). In 1917 he took command of the so-called Asiatic Corps, for operations in the Caucasus, and in 1918 and 1919 was at the head of the X. Army in Lithuania.

He wrote an interesting account of the German conduct of the war during its first two years, entitled *Die oberste Heeresleitung in ihren wichtigsten Entschliessungen 1914-16* (1919), and *Der Feldzug der IX. Armee gegen die Rumänen und Russen 1916-17* (2 vols. 1921). He died on April 8, 1922, at the castle of Lindstedt, near Wildpark.

See A. Alberte, *General Falkenhayn, die Beziehungen zwischen den Generalstabschefs des Dreibunds* (1924).

FALKIRK, municipal and police burgh and parish, Stirling-shire, Scotland. Pop. (1931) 36,565. It is on high ground overlooking the fertile Carse of Falkirk, 11 m. S.E. of Stirling, and about midway between Edinburgh and Glasgow. Grangemouth, its port, lies 3 m. to the N.E., and the Forth and Clyde canal passes to the north, and the Union canal to the south of the town. The town is under the control of a council with provost and bailies, and combines with Stirling and Grangemouth (the Stirling group of burghs) to return a member to parliament. The district is rich in coal and iron, which supply the predominant industries, Falkirk being the chief seat of the light-casting trade in Scotland; but tanning, flour-milling, brewing, distilling and the manufacture of explosives and chemicals are also carried on. The long important trysts or sales of cattle, sheep and horses were transferred hither from Crieff in 1770, and have been replaced by local weekly auction marts. Carron, 2 m. N.N.W., is famous for iron-works established in 1760 by Dr. John Roebuck (1718-1794), whose advising engineers were successively John Smeaton and James Watt. The original name of Falkirk was the Gaelic *Eaglais breac*, "church of speckled or mottled stone," which Simeon of Durham (fl. 1130) transliterated as Eglesbreth. By the end of the 13th century appears the form Faukirke (the present local pronunciation), a translation of the Gaelic *fau* or *faw*, meaning "dun," "pale red." The first church was built by Malcolm Canmore (d. 1093). Falkirk was made a burgh of barony in 1600 and a burgh of regality in 1646, but on the forfeiture of the earl of Linlithgow in 1715, its superiority was vested in the crown. Callender House, immediately to the south, was the seat of the earl and his ancestors. The wall of Antoninus ran through the

grounds, and the district is rich in Roman remains, Camelon, about 2 m. W., being the site of a Roman settlement. The eastern suburb of Laurieston was first called Langtoun, then Merchistown, and received its present name after Sir Lawrence Dundas of Kerse, who had promoted its welfare.

Battles of Falkirk.—The battle of July 22, 1298, was fought between the forces of King Edward I. of England and those of the Scottish national party under Sir William Wallace. The latter after long baffling the king's attempts to bring him to battle, had taken up a strong position south of the town behind a morass. The Scots formed in four deep and close masses ("schiltrons") of pikemen, the light troops screening the front and flanks and a small body of mounted men-at-arms in reserve. It was probably hoped that the English cavalry—overwhelmingly superior in strength—would plunge into the morass, for no serious precautions were taken as to the flanks, but in any case Wallace desired no more than to receive an attack at the halt, trusting wholly to his massed pikes. The English "vaward" or right wing first appeared, tried the morass in vain, and then set out to turn it by a long détour; the main battle under the king halted in front of it, while the "rereward" or left wing, under Antony Bec, bishop of Durham, wheeled off and rode round the flank of the marsh. Once on the enemy's side of the obstacle, the bishop halted to wait for Edward, who was now following him, but his undisciplined barons, shouting "'Tis not for thee, bishop, to teach us war. Go say mass!" drove off the Scottish archers and men-at-arms and charged the nearest square of pikes, which repulsed them with heavy losses. On the other flank the right wing, its flank march completed, charged with the same result. But Edward, who had now joined the bishop with the centre or "main battle," peremptorily ordered the cavalry to stand fast, and, taught by his experience in the Welsh wars, brought up his archers. The long-bow here scored its first victory in a pitched battle. Before long, gaps appeared in the close ranks of pike heads, and after sufficient preparation Edward again launched his men-at-arms to the charge. The shaken masses then gave way one after the other, and the Scots fled in all directions. The English cavalry as a whole forgot the lesson and remembered only the effect of the final charge. But Robert Bruce, who here served in the English left wing, turned Wallace's experience to profit and at Bannockburn (q.v.), 16 years later, not only took care to secure his flanks but used his cavalry promptly to disperse the English archers.

The second battle of Falkirk, fought on January 17, 1746, between the Highlanders under Prince Charles and the British forces under General Hawley, resulted in the defeat of the latter. It is remarkable only for the bad conduct of the British dragoons and the steadiness of the infantry. Hawley, with whom served James Wolfe (q.v.), retreated to Linlithgow, leaving all his baggage, 700 prisoners, and seven guns in the enemy's hands.

FALKLAND, LUCIUS CARY, 2nd Viscount (c. 1610-1643), son of Sir Henry Cary, afterwards 1st Viscount Falkland (d. 1633), lord deputy of Ireland from 1622 to 1629, was born either in 1609 or 1610, and was educated at Trinity College, Dublin. In 1625 he inherited from his grandfather the manors of Great Tew and Burford in Oxfordshire; he married Lettice, daughter of Sir Richard Morrison. In 1633 he succeeded his father as Viscount Falkland. He assembled round him at Great Tew many learned men. He was the friend of Hales and Chillingworth, was celebrated by Jonson, Suckling, Cowley and Waller in verse, and in prose by Clarendon, who is eloquent in describing the virtues and genius of the "incomparable" Falkland, and draws a delightful picture of his society and hospitality.

Falkland served on the king's side as a volunteer under Essex in the campaign of 1639 against the Scots. In 1640 he was returned for Newport in the Isle of Wight to the Short and Long Parliaments, and took an active part on the side of the opposition. He spoke against the exaction of shipmoney on Dec. 7, 1640, denouncing the servile conduct of Lord Keeper Finch and the judges. He supported the prosecution of Strafford and voted for the third reading of the attainder. On the church question he deprecated clerical encroachment in secular matters; on the other hand, though he denied that episcopacy existed

iure divino, he was opposed to its abolition, fearing the establishment of the Presbyterian system, which in Scotland had proved equally tyrannical. In fact Falkland sought compromise but a bill simply excluding the clergy from secular offices failed, and on May 27, 1641 the Root and Branch Bill, for the total abolition of episcopacy, was introduced in the House of Commons. This measure Falkland opposed, as well as the second bill for excluding the bishops, introduced on Oct. 21. In the discussion on the Grand Remonstrance he took the part of the bishops and the Arminians. He was now definitely ranged against the policy of the parliament, and on Jan. 1, 1642, was persuaded by Hyde to accept the secretaryship of state, though he had little influence in the king's councils.

He signed the protestation against making war, at York on June 15, 1642. On Sept. 5 he carried Charles's overtures for peace to the parliament, when he informed the leaders of the opposition that the king consented to a thorough reformation of religion. The secret correspondence connected with the Waller plot passed through his hands. He was present with the king at Edgehill and at the siege of Gloucester. By this time the hopelessness of the situation had completely overwhelmed him, and he welcomed death on the battlefield as an escape from the catastrophe which he foresaw but saw no means of avoiding. Riding alone at a gap in a hedge commanded by the enemy's fire in the battle of Newbury (Sept. 20, 1643), he was immediately killed. He was succeeded in the title by his eldest son, Lucius, 3rd Viscount Falkland, his male descent becoming extinct in the person of Anthony, 5th viscount, in 1694, when the viscountcy passed to Lucius Henry (1687-1730), a descendant of the first viscount.

Falkland wrote a *Discourse of Infallibility* (1646); *A Letter . . . 30 Sept. 1642 concerning the late conflict before Worcester* (1642); and *Poems* (ed. A. B. Grosart, 1871, in Fuller's Worthies Library) in which he shows himself a follower of Ben Jonson.

See Lady M. T. Lewis, "Life of Falkland" in *Lives of the Friends . . . of Lord Chancellor Clarendon*, vol. i. p. 3 (1852); J. A. R. Marriott, *Life and Times of Lucius Cary, Viscount Falkland* (1907).

FALKLAND, a royal burgh and parish, Fifeshire, Scotland. Pop. (1931) 791. It is at the northern base of the hill of East Lomond (1,471 ft. high), 2½ m. from Falkland Road station on the L.N.E.R. main line to Dundee, 21 m. N. of Edinburgh as the crow flies. Many ancient houses still stand. Most of the inhabitants are engaged in the manufacture of linen and linoleum. The place is famed for the ancient palace of the Stuarts. An older building that occupied this site was a hunting-tower of the Macduffs, earls of Fife, and was transferred with the earldom in 1371 to Robert Stewart, earl of Fife and Menteith, afterwards duke of Albany, second son of Robert II. Because of his father's long illness and the incapacity of Robert III., his brother Albany was during many years virtual ruler of Scotland, and, in the hope of securing the crown, caused the heir-apparent—David, duke of Rothesay—to be conveyed to the castle by force and there starved to death, in 1402. The conversion of the Thane's tower into the existing palace was begun by James III. and completed in 1538. The western part had two round towers, similar to those at Holyrood, which were also built by James V., and the southern elevation was ornamented with niches and statues. From the palace James V. when a boy fled to Stirling by night from the custody of the earl of Angus, and in it he died in 1542. Here, too, Queen Mary spent some of her happiest days. James VI. upset the schemes of the Gowrie conspirators by escaping from Falkland to St. Andrews, and it was while he was residing in the palace that the fifth earl of Bothwell, in 1592, attempted to kidnap him. In September 1596 a dramatic interview took place in the palace between the king and Andrew Melville and other Presbyterian ministers sent by the General Assembly at Cupar to remonstrate with him on allowing the Roman Catholic lords to return to Scotland. In 1654 the eastern wing was accidentally destroyed by fire, during its tenancy by the soldiers of Cromwell, by whose orders the fine old oaks in the park were cut down for the building of a fort at Perth. In 1715 Rob Roy garrisoned the palace and levied dues on the burgh and neighbourhood. The third marquess of

Bute acquired the estate and buildings in 1888, and undertook the restoration of the palace.

Falkland became a royal burgh in 1458 and its charter was renewed in 1595; before the earlier date it had been a seat of the Templars. It gives the title of viscount to the English family of Cary, the patent having been granted in 1620 by James VI. The town's most distinguished native was Richard Cameron, the Covenanter. His house—a three-storeyed structure with yellow harled front and thatched roof—still stands on the south side of the square in the main street.

FALKLAND ISLANDS, a group of islands in the South Atlantic ocean, belonging to Great Britain, and lying about 250 m. E. of the nearest point in the mainland of South America, between 51° and 53° S., and 57° 40' and 61° 25' W. With South Georgia island, the South Shetlands, South Orkneys, and other dependencies, they form the most southerly colony of the British empire. The islands, inclusive of rocks and reefs, exceed 100 in number and have a total area of 6,500 sq.m.; but only two are of considerable size. The area of East Falkland is about 3,000 sq.m., and that of West Falkland 2,300, while most of the others are mere islets, the largest 16 m. long by 8 m. wide. The two principal islands are separated by Falkland sound, a narrow strait from 18 to 2½ m. in width, running north-east and south-west. The general appearance of the islands is not unlike that of one of the outer Hebrides, dreary and monotonous inland, with much upland bog, but with fine coastal scenery. The coast-line of both main islands is deeply indented and many of the bays and inlets form secure and sheltered harbours, some of which, however, are difficult of access to sailing ships.

East Falkland is, except for a narrow peninsula of 1½ miles wide, bisected by two deep fjords, Choiseul and Brenton sounds. The northern portion is hilly, and is crossed by a rugged and difficult range, the Wickham Heights, running east and west, and rising in Mt. Osborne to 2,245 ft. The remainder of the island consists chiefly of low undulating ground, mostly pasture and morass, with many shallow freshwater tarns, and small streams running in the valleys. There are two fine inlets, Berkeley sound and Port William, at the north-eastern extremity of the island. Port Louis, formerly the seat of government, is at the head of Berkeley sound, but the anchorage there having been found rather too exposed, about the year 1844 a town was laid out, and the necessary public buildings were erected on Stanley harbour, a land-locked harbour within Port William. West Falkland is more hilly near the east island; the principal mountain range, the Hornby hills, runs north and south parallel with Falkland sound. Mount Adam, the highest hill in the islands, is 2,315 ft. high.

The little town of Stanley is built along the south shore of Stanley harbour and stretches a short way up the slope; it has a population of about 900. Government house, grey, stone-built and slated, calls to mind a manse in Shetland or Orkney. Next to Stanley the most important place on East Falkland is Darwin on Choiseul sound—a village of Scottish shepherds and a station of the Falkland Islands Company.

The Falkland islands consist entirely, with the exception of the southern part of East Falkland, which is Permo-Carboniferous, of the older Palaeozoic rocks, Lower Devonian or Upper Silurian, slightly metamorphosed and a good deal crumpled and distorted, in the low grounds clay slate and soft sandstone, and on the ridges hardened sandstone passing into the conspicuous white quartzites. There are no minerals of value, but galena is found in small quantity, and in some places it contains a large percentage of silver. There is also a quantity of fine white sand reported suitable for glass-making, and there are small and sporadic occurrences of high-grade iron ores.

Many of the valleys in the Falklands are occupied by pale glistening masses which at a little distance much resemble small glaciers. Examined more closely these are found to be vast accumulations of blocks of quartzite, irregular in form, but having a tendency to a rude diamond shape, from 2 to 20 ft. in length, and half as much in width, and of a thickness corresponding with that of the quartzite ridges on the hills above. The blocks are angular, and rest irregularly one upon another. The whole mass

looks as if it were, as it is, slowly sliding down the valley to the sea. These "stone runs" are looked upon with great wonder by the shifting population of the Falklands, and they are shown to visitors with many strange speculations as to their mode of formation. One of many theories is that the hard beds of quartzite were denuded by the disintegration of the softer layers in an interglacial period, slid down the slopes by their own weight and have since been completely denuded by the action of water.

CONDITIONS ON THE ISLANDS

The Falkland islands correspond very nearly in latitude in the southern hemisphere with London in the northern. The temperature is equable, the average of the two midsummer months being about 47° Fahr., and that of the two midwinter months 37° Fahr. The climate is not unlike that of the Outer Hebrides but is somewhat colder: occasional heavy snow-falls occur, and the sea in shallow inlets is covered with a thin coating of ice. The sky is almost constantly overcast, and rain falls, mostly in a drizzle and in frequent showers, on about 250 days in the year. The rainfall is not great, only about 26 in., but the mean humidity for the year is high. November is considered the only dry month. The prevalent winds from the west, south-west and south blow continuously, at times approaching the force of a hurricane. "A region more exposed to storms both in summer and winter it would be difficult to mention" (Fitzroy, *Voyages of "Adventure" and "Beagle,"* ii. 228). The fragments of many wrecks emphasize the dangers of navigation, which are increased by the absence of beacons, the only lighthouse being the one maintained by the Board of Trade on Cape Pembroke near the principal settlement.

Of aboriginal human inhabitants there is no trace in the Falklands, and the land fauna is very scanty. A small wolf or dog, the *loup-renard* of de Bougainville, is extinct, the last having been seen about 1875 on the West Falkland. Some herds of cattle and horses ran wild until recently; but these were, of course, introduced, the first having been brought by de Bougainville. Horses and cattle have declined in numbers, being profitably replaced by sheep of which there were over 600,000 in 1926. Except for about 80,000 acres, all available land is used for sheep-farming, which started in East Falkland in 1835. Land-birds are few in kind, and are mostly migrants from South America. They include, however, the snipe and military starling, which on account of its scarlet breast is locally known as the robin. Sea-birds are abundant, and, probably from the islands having been comparatively lately peopled, they are singularly tame. Gulls and amphibious birds abound in large variety; three kinds of penguin have their rookeries and breed here, migrating yearly for some months to the South American mainland. Stray specimens of the great king penguin have been observed, and there are also mollymauks (a kind of albatross), black-crested grebe, Cape pigeons and many carrion birds. Kelp and upland geese abound, the latter being edible; and their shooting affords some sport.

The Falkland islands form essentially a part of Patagonia, with which they are connected by an elevated submarine plateau, and their flora is much the same as that of Antarctic South America. The trees which form dense forest and scrub in southern Patagonia, and in Fuegia are absent, owing to the strong gales and salt-spray, and attempts at planting trees have not met with great success. The greater part of the "camp" (the open country) is formed of peat, which in some places is of great age and depth, and at the bottom of the bed very dense and bituminous. The peat is different in character from that of northern Europe: the lower plants enter but little into its composition, and it is formed almost entirely of the roots and stems of *Empetrum rubrum*, a variety of the common crowberry of the Scottish hills with red berries, called by the Falklanders the "diddle-dee" berry; of *Myrtus nummularia*, a little creeping myrtle whose leaves are used by the shepherds as a substitute for tea; and of sedges and sedge-like plants, such as *Astelja pumila*, *Gaimardia australis* and *Bostkovia grandiflora*. Peat is largely used as fuel, coal being obtained only at a high price.

Two vegetable products, the "balsam bog" (*Azorella caespitosa*)

and the "tussock grass" (*Poa flabellata*) have been objects of curiosity and interest ever since the first accounts of the islands were given. The first is a huge mass of a bright green colour, living to a great age, and when dead becoming of a grey and stony appearance. When cut open, it displays an infinity of tiny leaf-buds and stems, and at intervals there exudes from it an aromatic resin. The "tussock grass" is a wonderful and most valuable natural production, which, owing to the introduction of stock, has become extinct in the two main islands, but still flourishes elsewhere in the group. It is a reed-like grass, which grows in dense tufts from 6 to 10 ft. high from stool-like root-crowns. It forms excellent fodder for cattle, and is regularly gathered for that purpose.

The population was estimated at 2,197 in 1924. The large majority of the inhabitants live in the East island, and the predominating element is Scottish—Scottish shepherds having superseded the South American Gauchos. In 1867 there were no settlers on the West island, and the government issued a proclamation offering leases of grazing stations on very moderate terms. In 1868 all the available land was occupied. These lands are fairly healthy, the principal drawback being the virulent form assumed by simple epidemic maladies. The occupation of the inhabitants is almost entirely pastoral, and the principal industry is sheep-farming. Wool forms by far the largest export, and tallow, hides, bones and frozen mutton are also exported. Trade is carried on almost entirely with the United Kingdom; the value of exports in 1926 was nearly £240,000, most of which was in wool, and of imports nearly £180,000. The Falkland Islands Company, having its headquarters at Stanley and an important station in the camp at Darwin, carries on an extensive business in sheep-farming and the dependent industries, and in the general import trade. The development of this undertaking necessitated the establishment of stores and workshops at Stanley, and ships can be repaired and provided in every way; a matter of importance in such stormy seas. A former trade in oil and sealskin has decayed, owing to the smaller number of whales and seals remaining about the islands and the headquarters of the whaling industry has been moved to South Georgia. Communications are maintained on horseback and by water, and there are no roads except at Stanley. Mail leaves for England monthly, passage being about four weeks.

The Falkland Islands were first seen by Davis in the year 1592, and Sir Richard Hawkins sailed along their north shore in 1594. The claims of Amerigo Vespucci to a previous discovery are doubtful. In 1598 Sebald de Wert, a Dutchman, visited them, and called them the Sebald Islands, a name which they bear on some Dutch maps. Captain Strong sailed through between the two principal islands in 1690, landed upon one of them, and called the passage Falkland Sound, and from this the group afterwards took its English name. In 1764 the French explorer de Bougainville took possession of the islands on behalf of his country, and established a colony at Port Louis on Berkeley Sound. But in 1767 France ceded the islands to Spain, de Bougainville being employed as intermediary. Meanwhile in 1765 Commodore Byron had taken possession on the part of England on the ground of prior discovery, and had formed a settlement at Port Egmont on the small island of Saunders. The Spanish and English settlers remained in ignorance, real or assumed, of each other's presence until 1769–1770, when Byron's action was nearly the cause of a war between England and Spain, both countries having armed fleets to contest the barren sovereignty. In 1771, however, Spain yielded the islands to Great Britain by convention.

The Falkland islands are a crown colony, with a governor and executive and legislative councils. The colony is self-supporting, the revenue being largely derived from the drink duties, and there is no public debt. The Falklands are the seat of a colonial bishop. Education is compulsory. The government maintains schools and travelling teachers; the Falkland Islands Company also maintains a school at Darwin. Stanley was for some years a naval station, but ceased to be so in 1904. It is now a wireless station.

FALKLAND ISLANDS, BATTLE OF. One of the principal actions of the World War, known as the Battle of the Falklands, was fought on Dec. 8, 1914, to the south-eastward of the Falkland Islands, between a British squadron under Vice-Admiral Sir Doveton Sturdee and a German squadron under Vice-Admiral Graf von Spee. This battle was a counter-stroke to the battle of Coronel (*q.v.*).

With the utmost secrecy the two battle-cruisers "Invincible" and "Inflexible" had been detached from the Grand Fleet in the North Sea and sent, with all despatch, to reinforce the British squadron in the South Atlantic. Admiral Sturdee's orders, on leaving England in the "Invincible," were to "Seek out and destroy the enemy." The following table shows the details of the rival forces:—

British.			
Type.	Ships.	Guns.	Nominal speed.
Battle cruisers	"Invincible"	8 12-in.	26 Knots
	"Inflexible"	8 12-in.	26 "
Armoured cruisers	"Carnarvon"	4 7.5-in., 6 6-in.	22 "
	"Cornwall"	14 6-in.	23.5 "
	"Kent"	14 6-in.	23.5 "
Light cruisers	"Glasgow"	2 6-in., 10 4-in.	25 "
	"Bristol"	2 6-in., 10 4-in.	24 "
Armed merchant cruiser	"Macedonia"
German.			
Armoured cruisers	"Scharnhorst"	8 8.2-in.	23 Knots
	"Gneisenau"	6 5.9-in.	23 "
		8 8.2-in.	23 "
		6 5.9-in.	23 "
Light cruisers.	"Leipzig"	10 4.1-in.	23 "
	"Nürnberg"	10 4.1-in.	23.5 "
	"Dresden"	10 4.1-in.	24 "
Supply ships.	"Seydlitz"
	"Baden"
	"Santa Isabel"

Fleet at Port William.—After the defeat of Admiral Cra-dock's squadron at Coronel, the old battleship "Canopus" had returned to the Falklands and was berthed on the mud in Port Stanley, the inner harbour. Her light guns had been erected on shore and the entrance to the harbour mined with electric mines constructed out of old oil drums. A signal station had been erected and the local volunteers organized as a defence force. Thus

being sturdily prepared for eventualities, the little colony had waited.

On his arrival at Port William on December 7, Admiral Sturdee ordered the "Macedonia" to patrol outside the harbour; the "Inflexible" and "Kent" to be ready for 14 knots at half-an-hour's notice and the other ships of his squadron to keep steam for 12 knots at two hours' notice. Only three colliers were available, so all ships could not coal at once. By 6 A.M. on December 8, the "Carnarvon" and "Glasgow" had finished coaling. The "Invincible" and "Inflexible" then began. The "Bristol" had her fires out to remedy defects and the "Cornwall" had one engine opened up at six hours' notice; the "Glasgow" was also repairing machinery and could not be ready for two hours. Such was the situation when, at 7.50 A.M., the observation post on Sapper's Hill reported two strange ships in sight. At 7.56 A.M. the "Glasgow" fired a gun to draw attention to a signal flying in the "Canopus," making known this report.

German Squadron in Sight.—A scene of activity ensued; colliers were cast off and preparations made for leaving harbour. The "Kent," having just taken over guard duty, was ordered to weigh and observe the enemy. The general signal to weigh was

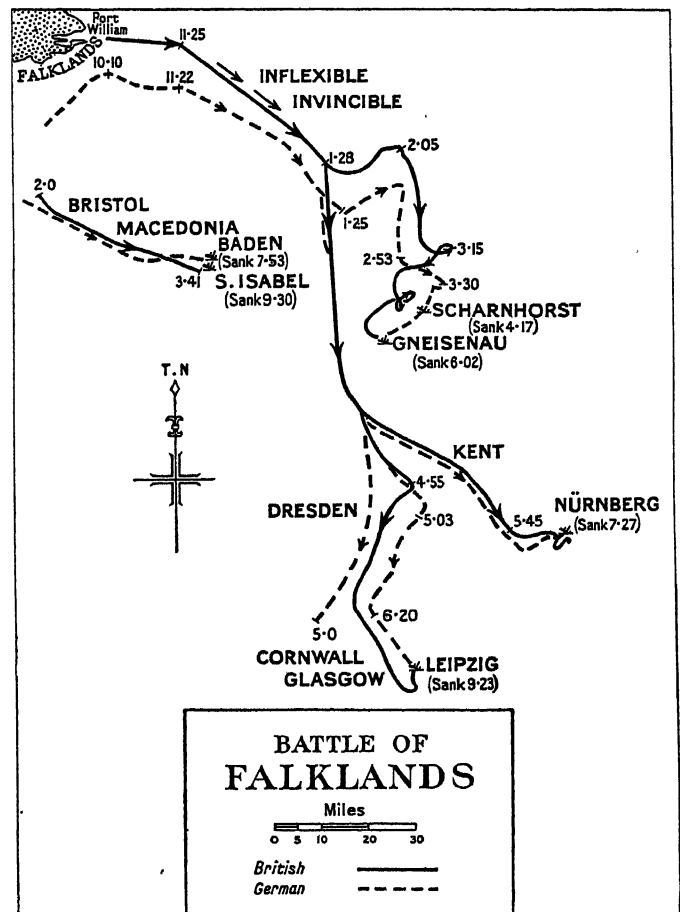

FIG. 1.—GENERAL PLAN OF THE BATTLE OF THE FALKLAND ISLANDS, 1914. The plan shows the course of the engagement from the morning of Dec. 8, 1914, when the British ships, under Admiral Sturdee, left Port William, until the sinking of the last German ship, the "Leipzig," at 9.23 p.m. The "Dresden," the only German ship to escape, is shown bearing away to the south-west at 5.00 p.m.

made at 8.14 A.M.; at 8.30 "Action" was sounded off and all ships were striving to raise steam at the earliest possible moment.

The two ships which had been sighted were the "Gneisenau" and "Nürnberg," which von Spee had sent on ahead to reconnoitre; they were not visible from the "Canopus" but, with the aid of an extemporized observation hut which had been established on the hill, she opened fire on them at 9.15 A.M. with her 12in. guns. The range, however, was too great and the shots fell short; nevertheless, the firing made the two German ships turn away to the south-east.

Von Spee, in the "Scharnhorst" was some 15 miles distant from the harbour, but the clouds of smoke visible over the intervening land made him suspicious. The "Gneisenau" was near enough to make out the masts and funnels of six ships in the harbour, and, worse still, some observers thought they could distinguish the tripod masts of battle-cruisers. The report from the "Gneisenau" confirmed von Spee in his misgivings and he immediately ordered the advanced ships not to accept action. This order was followed by a general signal to his squadron to raise steam in all boilers and steer east.

Von Spee's Intentions.—It is impossible to be sure with what intention Admiral von Spee made for the Falkland Islands. By one account he expected to find there a British squadron weaker than his own; he hoped to draw them to sea, destroy them, and then occupy the Islands. Some colour is lent to this by the report of British officers at the observation post on shore that they could distinguish, through telescopes, men on board the "Gneisenau" dressed and equipped ready for landing. Von Spee was certainly unaware that the Admiralty had despatched two battle-cruisers to these waters. Their arrival just in time was a stroke of luck which the latter fully deserved; but Admiral Sturdee was momentarily at a distinct disadvantage owing to his ships being at anchor with colliers alongside.

Von Spee's position if the British squadron brought him to action in the open was hopeless; but if the Germans had pressed home an attack at the entrance to the harbour, the prospects would have been far from pleasant for the British forces within.

Pursuit of the German Squadron.—By 10.15 A.M. all ships, excepting the "Bristol," had steam up, and 15 minutes later they had cleared the harbour; the enemy was hull-down to the south-east, some 12 or 13 miles distant; so Admiral Sturdee made the signal for "general chase," an order for each ship to steam at her utmost speed in pursuit. The sea was calm, the sky clear, and a light north-westerly breeze was blowing. At 10.50 A.M. it became evident that the British ships were gaining and Sturdee ordered the "Glasgow" to keep three miles ahead, and the "Inflexible" to keep on the port quarter, of the "Invincible." This annulled the "general chase." By 11 A.M. the German ships were clearly visible and the battle-cruisers reduced speed to 24 knots. The "Carnarvon" and "Cornwall" were now lagging behind, their best speed being 20 knots and 22 knots respectively, and, to avoid his ships becoming too widely scattered, Sturdee reduced the speed of the squadron to 19 knots and ordered the crews to be piped to dinner. The German squadron was then doing little more than 15 knots.

Meanwhile, the German auxiliaries had been sighted from the Islands, and the "Bristol," which by extraordinary exertions had managed to raise steam and was just leaving harbour, was ordered to take "Macedonia" under her orders and "destroy the transports." Unfortunately, it was not known then that these ships were colliers.

At 12.20 P.M. Sturdee decided to press the chase and speed was increased to 22 knots; by 12.50 P.M. the British battle-cruisers were steaming 25 knots and were rapidly overhauling the enemy. At 12.55 P.M. fire was opened by the "Inflexible" on the "Leipzig" at a range of 16,000 yards. To save his light cruisers, von Spee ordered them to scatter and make for the South American coast; they turned away to the southward at about 1.20 P.M. Such a contingency had been provided for, and, without further orders, the British cruisers turned off in pursuit (*see fig. 1*).

The Battle-cruiser Action.—As his light cruisers left him, von Spee turned to the eastward to accept action; and Sturdee's battle-cruisers turned into line ahead on a nearly parallel course to the enemy. Fire was now opened on both sides, but the range—about 14,000yd.—was too great, and the shots from the German ships fell short. The range closed to 12,500yd. and about 1.45 P.M. "Invincible" was hit; whereupon Sturdee turned away to open the range and obtain full advantage from his heavier armament. His object was to annihilate the enemy, but in doing so to receive as little damage as possible. By 2 P.M. the range had increased to 16,000yd. and firing ceased for a time (*see fig. 2*).

In order to renew the action, the British battle-cruisers altered course to starboard, and gradually reduced the range to 15,000yd. Fire was then reopened and von Spee again accepted action, manoeuvring his ships to reduce the range sufficiently for his secondary armament to be brought into action. Sturdee allowed the range to fall to about 12,500yd. and then, as the Germans began to fire with their 5.9-in. guns, he sheered off again. With

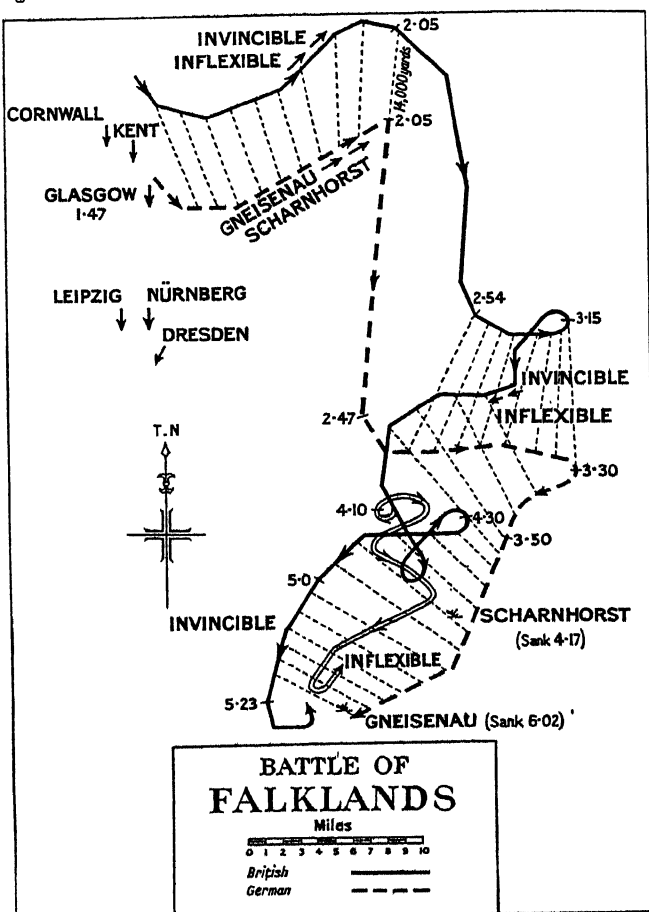

FIG. 2.—DETAILS OF THE FIGHT BETWEEN THE CAPITAL SHIPS. The engagement between "Invincible" (Admiral Sturdee) and "Inflexible," and "Scharnhorst" (Admiral von Spee) and "Gneisenau" is shown in greater detail. Both German ships went down with flags flying, and 187 of the crew of the "Gneisenau" were saved. The result of the battle was that Great Britain regained control of the ocean trade routes until the submarine campaign began.

his superior speed Sturdee was able to keep the range as he wished and the British guns now began to inflict severe damage on the enemy ships.

By 3.10 P.M. the Germans showed signs of damage; the "Scharnhorst" being on fire. The smother of smoke made spotting the fall of shot a matter of some difficulty, so, at 3.15 P.M., Sturdee turned the battle-cruisers round to port; von Spee replied by also turning his ships, and the action now ran to the south-westward.

End of the "Scharnhorst."—By 4 P.M. the "Scharnhorst" was suffering terribly; she was on fire from stern to stern; her superstructure was in ruins and she had a heavy list to port, but she continued to fire gamely with her remaining guns. Her end came at 4.17 P.M., when she turned completely over and sank with flag flying. No one was saved.

The "Gneisenau" Sunk.—After the "Scharnhorst" sank, both battle-cruisers engaged the "Gneisenau," and, to prevent being blinded by smoke, steered on independent courses. The "Carnarvon" had now been able to close sufficiently to open fire, and the doomed German cruiser became a target for a concentrated fire from three directions. Her fire slackened; she was on fire fore and aft and her speed rapidly dropped. Her one remaining gun continued to fire at intervals; but at 5.40 P.M. her splendid fight

against hopeless odds was at an end and she heeled slowly over and sank at about 6 P.M. The British ships closed, lowered their boats and succeeded in rescuing 187 survivors from the icy water.

The Light Cruisers.—When the German light cruisers broke away, they had about 11 miles' start on their pursuers. The British ships had nominally no superiority in speed, but, owing to their recent continuous cruising, the boilers in the German ships were in no condition to withstand severe pressure. At first the enemy kept together (*see* fig. 1). The "Glasgow" was the fastest of the pursuers and soon forged ahead of her consorts, the "Kent" and "Cornwall," and, having crossed ahead of them, she headed for the "Dresden," the fastest of the pursued. It was, however, soon evident that the only chance of bringing the enemy to action before the light failed, was to attack the rearmost ship, in the hopes that this would bring the others back to her assistance.

"Glasgow" and "Cornwall" versus "Leipzig."—At 2.53 P.M. the "Glasgow" opened fire on the "Leipzig" and by 4.15 P.M. the "Cornwall" had closed the range sufficiently to bring her guns into action. The "Leipzig" suffered considerably under the cross-fire from the two British cruisers; her speed too was falling so rapidly that her attackers were in the fortunate position of being able to keep the range as they desired. By 7 P.M. the "Leipzig's" stern was enveloped in flames and she was in sorry plight, but she made no sign of surrender. At about 8.10 P.M. she made signals of distress and the British ships closed and lowered boats to rescue survivors. At 9.23 P.M. there was an explosion and the "Leipzig" disappeared.

"Kent" versus "Nürnberg."—The "Kent" meanwhile had been pursuing the "Nürnberg" and, by extraordinary efforts on the part of her engine-room department, succeeded in exceeding her designed speed. At 5 P.M. the "Nürnberg" opened fire, but the 6-in. guns of the "Kent" were not yet within range. The weather was becoming thick, owing to a fine drizzle having set in, when fortune favoured the pursuer; the "Nürnberg's" boiler tubes gave out and her speed sank rapidly, which enabled the "Kent" to close to effective range. By 6.25 P.M. the "Nürnberg" was a blazing wreck and about 7.30 P.M. she turned over and sank. The boats from the "Kent" searched the sea until 9 P.M. but rescued only seven survivors.

Casualties.—The following table shows the casualties of the British and German forces:—

Ship.	Hits received.	Casualties.	Rounds fired.
British:			
"Invincible" .	22	0 k., 1 w.	573 12-in.
"Inflexible" .	3	1 k., 2 w.	661 12-in.
"Glasgow" .	2	1 k., 4 w.	316 6-in.
"Cornwall" .	18	0 k., 0 w.	1000 6-in.
"Kent" .	36	4 k., 12 w.	646 6-in.
"Carnarvon" .	0	0 k., 0 w.	..
German:			
"Scharnhorst" .	Sunk	All	..
"Gneisenau" .	Sunk	187 saved	..
"Leipzig" .	Sunk	18 "	..
"Nürnberg" .	Sunk	7 "	..
"Dresden" .	Escaped

k=killed w=wounded.

German Colliers Destroyed.—Meanwhile two of the German colliers had been overhauled by the "Bristol" and "Macedonia." They were captured at about 4 P.M. The signalled order to the "Bristol" to "destroy the transports" was literally obeyed in spite of these ships not being transports, but ships full of valuable coal. The "Dresden" escaped and was not hunted down and destroyed until March 14, 1915.

Conclusion.—The Battle of the Falklands was a very decisive victory for the British, inasmuch as it marked the end of a definite phase of the war at sea. As a result, German cruiser warfare collapsed and England held, outside the narrow seas, undisputed control of the ocean trade routes of the world.

FALLACY, the term given generally to any mistaken statement used in argument; in logic, technically, any violation of the conditions of valid inference (Lat. *fall-ax*, apt to mislead). An argument may be fallacious in *matter* (*i.e.*, misstatement of facts), in *wording* (*i.e.*, wrong use of words), or in the *process of inference*. Fallacies have, therefore, been classified as: I. Material, II. Verbal, III. Logical or Formal; II. and III. are often included under the general description *Logical*, and in scholastic phraseology, following Aristotle, are called fallacies *in dictione* or *in voce*, as opposed to material fallacies *in re* or *extra dictionem*.

I. **Material.**—The classification widely adopted by modern logicians and based on that of Aristotle, *Organon* (*Sophistici elenchi*), is as follows:—(1) *Fallacy of Accident*, *i.e.*, confusing what is accidental with what is essential. (2) *Secundum Quid*, *i.e.*, arguing erroneously from a general rule to a particular case, without proper regard to special circumstances which vitiate the application of the general rule; *e.g.*, if manhood suffrage be the law, arguing that a criminal or a lunatic must, therefore, have a vote; or the converse fallacy of arguing from a special case to a general rule; (3) *Irrelevant Conclusion*, or *Ignoratio Elenchi*, wherein, instead of proving the fact in dispute, the arguer seeks to gain his point by diverting attention to some extraneous fact (as in the legal story of "No case. Abuse the plaintiff's attorney"). Under this head come the so-called *argumentum* (a) *ad hominem*, (b) *ad populum*, (c) *ad baculum*, (d) *ad verecundiam*, common in platform oratory, in which the speaker obscures the real issue by appealing to his audience on the grounds of (a) purely personal considerations, (b) popular sentiment, (c) fear, (d) conventional propriety. This fallacy has been illustrated by ethical or theological arguments wherein the fear of punishment is subtly substituted for abstract right as the sanction of moral obligation. (4) *Petitio principii* (begging the question) or *Circulus in probando* (arguing in a circle), which consists in demonstrating a conclusion by means of premises which presuppose that conclusion. Jeremy Bentham points out that this fallacy may lurk in a single word, especially in an epithet, *e.g.*, if a measure were condemned simply on the ground that it is alleged to be "un-English"; (5) *Fallacy of the Consequent*, arguing from a consequent to its condition, *e.g.*, if a man is a drunkard he becomes destitute. Therefore if he is destitute, he is a drunkard. (6) *Fallacy of False Cause*, or *Non Sequitur* ("it does not follow"), bases a conclusion on an insufficient or erroneous *reason*. This is often confused with (7) *Post hoc* (after this, therefore, because of this), wherein one thing is incorrectly assumed as the *cause* of another, as when the ancients attributed a public calamity to a meteorological phenomenon; (8) *Fallacy of Many Questions* (*Plurium Interrogationum*), wherein several questions are improperly grouped in the form of one, and a direct categorical answer is demanded, *e.g.*, if a prosecuting counsel asked the prisoner "What time was it when you met this man?" with the intention of eliciting the tacit admission that such a meeting had taken place.

II. **Verbal Fallacies** are those in which a false conclusion is obtained by improper or ambiguous use of words. They are generally classified as follows: (1) *Equivocation* consists in employing the same word in two or more senses, *e.g.*, in a syllogism, the middle term being used in one sense in the major and another in the minor premise, so that in fact there are *four* not *three* terms ("All fair things are honourable; This woman is fair; therefore this woman is honourable," the second "fair" being in reference to complexion). (2) *Amphibology* is the result of ambiguity of grammatical structure, *e.g.*, of the position of the adverb "only" in careless writers ("He only said that," in which sentence, as experience shows, the adverb has been intended to qualify any one of the other three words). (3) *Composition*, a species of (1), which results from the confused use of collective terms ("The angles of a triangle are less than two right angles"

might refer to the angles separately or added together). (4) *Division*, the converse of the preceding, which consists in employing the middle term distributively in the minor and collectively in the major premise. (5) *Accent*, which occurs only in speaking and consists of emphasizing the wrong word in a sentence ("He is a fairly good pianist," according to the emphasis on the words, may imply praise of a beginner's progress, or an expert's depreciation of a popular hero, or it may imply that the person in question is a deplorable violinist). (6) *Figure of Speech*, misinterpretation of a form of expression or an inflexion; e.g., taking "desirable" to mean what *can be desired* (instead of what ought to be desired) because "visible" means what can be seen.

III. The purely **Logical** or **Formal** fallacies consist in the violation of the formal rules of the syllogism (*q.v.*). They are (a) fallacy of four terms (*Quaternio terminorum*); (b) of undistributed middle; (c) of illicit process of the major or the minor term; (d) of negative premises.

Of other classifications of fallacies in general the most famous are those of Francis Bacon and J. S. Mill. Bacon (*Novum organum*, Aph. i. 33, 38 *sqq.*) divided fallacies into four *Idola* (Idols, *i.e.*, false appearances), which summarize the various kinds of mistakes to which the human intellect is prone (see BACON, FRANCIS). With these should be compared the *Offendicula* of Roger Bacon, contained in the *Opus maius*, pt. i. (see BACON, ROGER). J. S. Mill discussed the subject in book v. of his *Logic*, and Jeremy Bentham's *Book of Fallacies* (1824) contains valuable remarks.

See A. Sidgwick, *Fallacies* (1883); H. W. B. Joseph, *An Introduction to Logic* (1916).

FALLIÈRES, CLÉMENT ARMAND (1841–), president of the French republic, was born on Nov. 6, 1841, at Mézin (Lot-et-Garonne), where his father was clerk of the peace. He studied law and became an advocate at Nérac, beginning his public career there as municipal councillor (1868), afterwards mayor (1871), and as councillor-general of the department of Lot-et-Garonne (1871). He lost his position in May 1873 upon the fall of Thiers, but in Feb. 1876 was elected deputy for Nérac. In the chamber he sat with the Republican Left, signed the protestation of May 18, 1877, and was re-elected in October by his constituency. He held at first a minor part (1880–81) in the Jules Ferry ministry, was then minister of the interior (1882–83), and for a month (Feb. 1883) premier. His ministry had to face the question of the expulsion of the pretenders to the throne of France, owing to the proclamation by Prince Jérôme Napoleon (Jan. 1883), and Fallières, who was ill at the time, resigned when the senate rejected his project. He became minister of public instruction (Nov. 1883–March 1885), then minister of the interior in the Rouvier cabinet in May 1887, and exchanged his portfolio in December for that of justice. He returned to the ministry of the interior in Feb. 1889, and was minister of justice from 1890 to 1892. In June 1890 his department (Lot-et-Garonne) elected him to the senate by 417 votes to 23. In March 1899 he was elected president of the senate, and retained that position until Jan. 1906, when he was chosen by a union of the groups of the Left in both chambers as candidate for the presidency of the republic. He was elected on the first ballot by 449 votes against 371 for his opponent, Paul Doumer. He held office until Jan. 7, 1913, when he was succeeded by Poincaré. For the events of his presidency see FRANCE: *History*.

FALLING STARS: see METEOR.

FALL-LINE, in American geology, a line marking the junction between the hard rocks of the Appalachians and the softer deposits of the coastal plain. The pre-Cambrian and metamorphic rocks of the mountain mass form a continuous ledge parallel to the east coast, where they form a series of "falls" and rapids in the river courses all along this line. The relief of the land below the falls is very slight, and this low country rarely rises to a height of 200ft., so that the rivers are navigable up to the falls, while the falls themselves are a valuable source of power. A line of cities may be traced upon the map whose position will thus be readily understood in relation to the economic importance of the fall-line. They are Trenton on the Delaware, Philadelphia on the

Schuylkill, Georgetown on the Potomac, Richmond on the James, and Augusta on the Savannah. It will be readily understood that the softer and more recent rocks of the coastal plain have been more easily washed away, while the harder rocks of the mountains, owing to differential denudation, are left standing high above them, and that the trend of the edge of this great lenticular mass of ancient rock is roughly parallel to that of the Appalachian system.

FALLMERAYER, JAKOB PHILIPP (1790–1861), German scholar, son of a peasant, was born at Tschötsch, near Brixen in Tirol, on Dec. 10, 1790. In 1809 he ran away from the cathedral choir school at Brixen, and then studied philology first at Salzburg and then at Landshut. After two years' service in the Napoleonic wars (1813–15) and two years of garrison life after the peace, he became a schoolmaster at Augsburg and later at Landshut. In 1827 he won the gold medal offered by the university of Copenhagen with his most important work *Geschichte des Kaisertums von Trapezunt* (Trebizond), based on patient investigation of Greek and oriental mss. at Venice and Vienna. Prior to his discovery of the chronicle of Michael Panaretos, covering the dominion of Alexius Comnenus and his successors from 1204 to 1426, the history of this mediaeval empire was practically unknown. During 1831–47, he travelled widely in the East with intervals spent in Munich, and after the revolution of 1848 became professor of history at Munich university and member of the national congress at Frankfurt-on-Main. There he joined the left, or opposition party, and in 1849 accompanied the rump-parliament to Stuttgart, and was expelled from his chair at the university. The amnesty of April 1850 enabled him to return to Munich. He died on April 26, 1861.

Fallmerayer's contributions to the mediaeval history of Greece are of great value, and his theory that the modern Greeks are of Albanian and Slav descent, with hardly a drop of true Greek blood in their veins has served to modify the opinions of even his greatest opponents. A criticism of his views will be found in Hopf's *Geschichte Griechenlands* (from Ersch and Gruber's *Encykl.*) and in Finlay's *History of Greece in the Middle Ages*.

His other works include *Über die Entstehung der Neugriechen* (Stuttgart, 1835); "Originalfragmente, Chroniken, u.s.w., zur Geschichte des K. Trapezunts" (Munich, 1843), in *Abhandl. der hist. Classe der K. Bayerisch. Akad. v. Wiss.*; *Das albanesische Element in Griechenland*, iii. parts, in the *Abhandl.* for 1860–66. See his *Gesammelte Werke* (3 vols., 1861) containing *Studien und Erinnerungen aus meinem Leben* and a sketch of his life by the editor, G. M. Thomas.

FALLOPIUS or FALLOPIO, GABRIELLO (1523–1562), Italian anatomist, was born at Modena, where he became a canon of the cathedral. He studied medicine at Ferrara and became teacher of anatomy in that city, and later at Pisa and Padua, where he worked with Vesalius. He died on Oct. 9, 1562. Fallopius discovered and described the chorda tympani, the sphenoid sinus, the opening of the ovarian tubes of the human female into the abdominal cavity, the trigeminal, auditory and glossopharyngeal nerves. He named the ovarian tubes, the vagina, the placenta, the muscles of the forehead, occiput and tongue. Only one treatise by Fallopius appeared during his lifetime, namely the *Observationes anatomicae* (Venice, 1561). His collected works, *Opera genuina omnia*, were published at Venice in 1584.

FALLOUX, FRÉDÉRIC ALFRED PIERRE, COMTE DE (1811–1886), French politician and author, was born at Angers on May 11, 1811. His father had been ennobled by Charles X., and Falloux began his career as a Legitimist and clerical journalist under the influence of Mme. Swetchine. In 1846 he entered the legislature as deputy for Maine-et-Loire, and with many other ultra-Catholics he gave real or pretended support to the revolution of 1848. Louis Napoleon made him minister of education in 1849, but disagreements with the president led to his resignation within a year. He had nevertheless secured the passage of the Loi Falloux (March 15, 1850) for the organization of primary and secondary education. This law provided that the clergy and members of ecclesiastical orders, male and female, might exercise the profession of teaching without producing any further qualification. This exemption was extended even to priests who taught in secondary schools, where a university degree was exacted from

lay teachers. The primary schools were put under the management of the curés. Falloux was elected to the French Academy in 1856. His failure to secure re-election to the legislature in 1866, 1869, 1870 and 1871 was due to the opposition of the stricter Legitimists, who viewed with suspicion his attempts to reconcile the Orleans princes with Henri, comte de Chambord. In spite of his failure to enter the National Assembly his influence was very great, and was increased by the intimacy of his personal relations with Thiers. But in 1872 he offended both sections of the monarchical party at a conference arranged in the hope of effecting a fusion between the partisans of the comte de Chambord and of the Orleans princes, divided on the vexed question of the flag. He suggested that the comte de Chambord might recede from his position with dignity at the desire of the National Assembly, and he insinuated the possibility of a transitional stage with the duc d'Aumale as president of the republic. His disgrace with the Catholic party was so complete that he was excommunicated by the bishop of Angers in 1876. He died on Jan. 16, 1886.

Of his numerous works the best known are his *Histoire de Louis XVI.* (1840); *Histoire de Saint Pie* (1845); *De la contre-révolution* (1876); and the posthumous *Mémoires d'un royaliste* (2 vols., 1888).

FALLOW, land ploughed and tilled, but left unsown usually for a year, in order, on the one hand, to disintegrate, aerate and free it from weeds, and, on the other, to allow it to recuperate. The "Sabbath rest" ordered to be given every seventh year to the land by Mosaic law is a classical instance of the "fallow." Improvements in crop rotations and manuring have diminished the necessity of the "bare fallow," which is uneconomical because the land is left unproductive, and because the nitrates in the soil intercepted by the roots of plants are washed away in the drainage waters. At the present time bare fallowing is, in general, only advisable on stiff soils and in dry climates. A "green fallow" is land planted with turnips, potatoes or some similar crop in rows, the space between which may be cleared of weeds by hoeing. The "bastard fallow" is a modification of the bare fallow, effected by the growth of rye, vetches, or some other rapidly growing crop, sown in autumn and fed off in spring, the land then undergoing the processes of ploughing, grubbing and harrowing usual in the bare fallow. (See CULTIVATION; ROTATION OF CROPS; DRY FARMING.)

FALLOW-DEER (*Dama dama*), a medium-sized representative of the family *Cervidae*, characterized by its palmated antlers, which generally have no bez-tine, rather long tail (black above and white below), and a coat spotted with white in summer but uniformly coloured in winter. The shoulder height is about 3ft. The species is semi-domesticated in British parks and occurs wild in western Asia, north Africa, south Europe, and Sardinia. In prehistoric times it occurred throughout northern and central Europe. Bucks and does live apart except during the pairing-season; and the doe produces one or two, and sometimes three fawns at a birth. The Persian fallow-deer (*D. mesopotamicus*), is larger and has a brighter coat, differing in some details of colouring. Here may be mentioned the gigantic fossil deer commonly known as the Irish elk (*Megaceros giganteus*), whose horns are of the fallow-deer type. This deer inhabited Ireland, Great Britain, central and northern Europe, and western Asia in Pleistocene and prehistoric times; and stood 6ft. high at the shoulder. The antlers were greatly palmated and of enormous size, fine specimens measuring 11 ft. between the tips.

FALL RIVER, a city of Bristol county, Massachusetts, U.S.A., on the east shore of Mount Hope bay, at the mouth of the Taunton river, 50 m. S. of Boston; a port of entry and one of the principal cotton-manufacturing centres of the country. It is served by the New York, New Haven and Hartford railroad and by the

famous Fall River Line of the New England Steamship Company and cargo steamers operating to Pacific and Atlantic ports. The population was 120,485 in 1920, of whom 42,331 were foreign-born white (including 10,734 French-Canadians, 7,971 British, 6,428 from the Atlantic islands, and 5,675 from Portugal); and was 115,274 in 1930.

The city faces west, stretching for 9m. along a granite ledge rising steeply from the river. About 200ft. above the city, and 2m. east, are the Watuppa Lakes, from which the little Quequechan (or Fall) river tumbles down. It runs through the city, flowing under the city hall, and its banks are lined with long rows of the great cotton-mills, many of them built of gray granite from the city's foundation. A city plan was adopted in 1923, which will correct the defects in the haphazard lay-out of the streets, utilize the natural advantages of the site, and transform Fall River into a beautiful and conveniently arranged city. On the banks of the Taunton river is the first unit of a hydro-electric plant which eventually will furnish 275,000 h.p. The harbour is large, deep, and easy of access. Its traffic in 1927 amounted to 4,140,000 tons, and included large receipts of coal and oil, and considerable commerce (100,000 tons) through the Panama canal. The aggregate output of the city's factories in 1927 was valued at \$120,324,418, of which over half (\$66,698,113) represented cotton goods. The cotton-mills (over 100) have about 4,000,000 spindles, one-ninth of the total number in the United States, and have an annual capacity of 400,000 bales of cotton. There are large hat factories; an oil refinery (built in 1922) with a capacity of 1,000,000 barrels a month; silk mills, shirt and curtain factories. The assessed valuation of property in 1927 was \$188,935,750. Bank debits in 1926 amounted to \$355,068,000. From the character of the dominating industry and of the population it results that Fall River has a considerable preponderance of women (92.6 males to 100 females, 1920); and a high percentage of boys and girls employed in occupations (18.5% in 1920 of the total population between 10 and 15 years of age). Fall River was incorporated as a town in 1803 and as a city in 1854. In 1860 the population was 14,026. Between 1865 and 1900 the number of spindles increased from 265,328 to 3,000,000, and the population grew to 48,961 in 1880 and 104,863 in 1900. Since 1900 there have been periods of great fluctuation, and the net increase has been relatively slow. In 1904-05 occurred a strike of the textile workers (for higher wages) lasting seven months, and thousands of operatives moved away. It was ended by arbitration by the governor, and resulted in the adoption of a plan for semi-annual conferences at which the wage-scale is adjusted. The industry, and consequently the city as a whole, was seriously affected by the depression of 1920-21, and by the growing competition of the southern cotton-mills. A disastrous fire occurred in 1843; and in Feb. 1928, 12 blocks in the heart of the business district were destroyed by fire. It was at Mount Hope, across the bay, that the Indian chieftain, king Philip, was captured and slain (1676).

FALLS CITY, the county seat of Richardson county, Nebraska, U.S.A., in the south-east corner of the State, on Federal highway 73, and served by the Burlington and the Missouri Pacific railways. The population was 4,930 in 1920 (94% native white), and was 5,787 in 1930 by the Federal census. It is in a fine apple-growing country, and ships also large quantities of poultry and poultry products, cattle, hogs and grain. The manufacturing industries include railroad shops, a flour mill and a creamery. Falls City was founded and incorporated in 1857. It was named from falls in the Nemaha river, which disappeared when the river was straightened.

FALMOUTH, a seaport, market town and municipal borough in the Penryn and Falmouth parliamentary division of Cornwall, England, 29¼ m. W.S.W. of London on a branch from Truro of the G.W. railway. Pop. (1931) 13,492. Falmouth is finely situated on the west shore of Carrick roads, the largest of the many estuaries which open on the south coast of Cornwall. Several streams empty into the estuary, opening to inland navigation by river steamer; the largest is the Fal, near the head of the estuary on the east shore, by which Truro is reached; while the Penryn river and creek joins Falmouth with Penryn on

THE FALLOW-DEER (*DAMA DAMA*) SEMI-DOMESTICATED IN BRITAIN AND CHARACTERIZED BY PALMATED ANTLEERS SOME 25 INCHES LONG

the west, and the picturesque inlet of the Porthcuel river opens out from St. Mawes near the entrance opposite Falmouth. Carrick roads form one of the best refuges for shipping on the south coast, being accessible at all times by the largest vessels. The shores are beautifully wooded, and slope sharply up to about 250 ft. The entrance from the more open Falmouth bay is 1 m. across between St. Anthony Head (with its powerful light) and Zoze point, on the east, and Pendennis point, the promontory of Falmouth, on the west. Pendennis and St. Mawes' castles are Tudor fortresses; the former is celebrated for its gallant defence in the Civil War, when Cornwall was a centre of the royalist cause—another memorial being the church of King Charles the Martyr, built in 1662–63 during the Restoration. Arwenack house is the ancient seat of the Killigrews, who were lords of the manor. Owing to its situation on the neck of a peninsula, Falmouth faces the water on both sides, and considerable improvements have been effected by the corporation in laying out a marine drive and pleasure grounds, etc. Among the principal buildings and institutions are the town-hall and market-house, the Royal Cornwall Sailors' home and hospital, a meteorological and magnetic observatory, and a submarine mining establishment. The Royal Cornwall Yacht club has its headquarters here; the principal prize in the annual regatta is a cup given by the prince of Wales as duke of Cornwall. Engineering, shipbuilding, brewing and the manufacture of manure are carried on, and there are oyster and mussel fisheries controlled by the corporation, and trawl fisheries, especially for pilchard. The growing importance of Falmouth as a ship repairing centre has been met by increased wharfage and the installation of modern workshops, as well as the addition of two new graving docks in 1926 and 1928, respectively 750 ft. and 611 ft. long, the latter being especially intended for the convenience of oil tank steamers. The area of the tidal harbour within the docks is c. 42 ac. Grain, timber, coal and manures are imported, and granite, china clay, copper ore, ropes and fish exported. Falmouth is also in favour as a watering-place. The municipal borough is under a mayor, four aldermen and 12 councillors, and has a separate commission of the peace. Area, 791 ac.

Falmouth (Falemuth) as a haven and port has had a place in the maritime history of Cornwall from early times. The site of the town, formerly known as Smithick and Pennycomequick, formed part of the manor of Arwenack held by the family of Killigrew, the last of whom died in the 18th century. In 1652 the Commonwealth parliament granted a market to Smithick. This market was confirmed to Sir Peter Killigrew in 1660 together with two fairs and a ferry between Smithick and Flushing, on the opposite shore of Penryn creek. By the charter of incorporation granted in the following year the name was changed to Falmouth. In 1664, an act creating the borough a separate ecclesiastical parish empowered the mayor and aldermen to assess all buildings within the town for the support of the rector. This rector's rate occasioned much ill-feeling in modern times, and by act of parliament in 1896 was taken over by the corporation, and provision made for its eventual amortization. In 1832 Penryn was united with Falmouth for parliamentary purposes, two members being assigned to the united boroughs. By the Redistribution act 1885, the number of members was reduced to one. In 1918 the borough was merged in the present county division.

FALSE IMPRISONMENT is the total restraint upon the liberty of another person for however short a time without legal justification. Partial restraint, such as preventing a person from walking in a particular direction, is not sufficient, but actual locking up is not necessary, and the restraint may be either physical or exercised on a show of authority (*Bird v. Jones*, 1845, 7 Q.B. 742). Imprisonment may be justified either at common law or under statute, but justification for interference with the liberty of the subject must be strictly proved. False imprisonment gives the right of a civil action for damages, but, in addition, where the detention is physical and continued a writ of *habeas corpus ad subjiciendum* may be obtained. (See also **ARREST** and **HABEAS CORPUS**.)

FALSE PRETENCES, in law, indicates the obtaining from any other person by any false pretence any chattel, money or valuable security, with intent to defraud. It is an indictable misdemeanour by statute. The broad distinction between this offence and larceny is that in the former the owner intends to part with his property, in the latter he does not. This offence dates as a statutory crime practically from 1757. In English law the only remedy originally available for an owner who had been deprived of his goods by fraud was an indictment for the crime of cheating. These remedies were insufficient to cover all cases where money or other properties had been obtained by false pretences, and the offence was first partially created by a statute of Henry VIII. (1541). The scope of the offence was enlarged to include practically all false pretences by an act of George IV. passed in 1757.

The law is now governed by the Larceny Act 1916, which by s. 32 enacts that every person who by any false pretence (1) with intent to defraud, obtains from any other person any chattel, money or valuable security, or (2) with intent to defraud or injure any other person, fraudulently causes or induces any other person to execute, make, accept, endorse or destroy the whole or any part of any valuable security, is guilty of a misdemeanour and liable to penal servitude for five years. Also by s. 40 of the same act, it is not necessary to prove an intent to defraud any particular person, but it is sufficient to prove that the person accused did the act charged with intent to defraud. And on a trial for larceny, if the facts so warrant, a verdict of false pretences may be returned, and if on a trial for obtaining by false pretences it is proved that the defendant stole the property in question, he is not by reason thereof entitled to be acquitted of obtaining such property by false pretences.

The principal points to notice are that the pretence must be a false pretence of some past or existing fact, made for the purpose of inducing the prosecutor to part with his property, and a pretence of future action is not sufficient. This rule was recognized in the Summary Jurisdiction Act 1899, for where justices propose to deal with a case summarily they must explain to the accused "that a false pretence means a false representation by words, writing or conduct that some fact exists or existed, and that a promise as to future conduct not intended to be kept is not by itself a false pretence." The property, too, must have been actually obtained by the false pretence. The owner must be induced by the pretence to make over the absolute and immediate ownership of the goods, for where temporary possession only is given it is "larceny by means of a trick." It is not always easy, however, to draw a distinction between the various classes of offences. In the case where a man goes into a restaurant and orders a meal, and, after consuming it, says that he has no means of paying for it, it was decided by the court for Crown cases reserved in *R. v. Jones*, 1898, L.R. 1 Q.B. 119, that it is neither larceny nor false pretences, but an offence under the Debtors Act 1869, of obtaining credit by fraud. (See also **CHEATING**; **FRAUD**; **LARCENY**.)

In the United States, false pretences in the various States is a crime by statutes, based largely upon the English statutes passed prior to the American Revolution. While the statutes are broad, they do not include every case of fraud and dishonesty whereby one person gains advantage over another.

FALSETTO, a forced form of sound production employed to obtain notes above the natural range of the voice. The notes of this register are of poor and peculiar quality owing to the vocal cords being only partially set in vibration.

FALSTAFF, SIR JOHN, a character in Shakespeare's *Henry IV.* and *Merry Wives*. In the original draft of *Henry IV. Part I.* he bore the name of the Lollard martyr, Oldcastle, which was changed in deference, it would seem, to protests from the family. Shakespeare substituted the name of Sir John Fastolf (*q.v.*).

FALTICENI, the capital of the department of Suceava, Rumania, on a tributary of the Sereeth, on the fall line between the Transylvanian Alps and the Bessarabian plain. Pop. about 10,000, over half of which is Jewish. A branch railway runs for 15 m. to join the main line between Czernowitz (Cernauti) and Galatz

(Galati). The Suceava department (named after Suceava or Suciava, its former capital) is densely forested; its considerable timber trade centres in Falticeni. It has a summer fair.

FALUN, a town of Sweden, capital of the district (*län*) of Kopparberg, 153 m. N.W. of Stockholm by rail. Pop. (1928) 13,611. It is situated in difficult country near the western shore of lake Runn. Its famous copper mines have been worked since the 13th century. Their produce has gradually decreased since the 17th century, and is now unimportant, but various secondary products are still obtained. The mines belong to the Kopparberg Mining company, the oldest industrial corporation in Sweden, established before 1347. At present it has various industrial interests besides copper mining. Falun has railway rolling-stock factories and there are museums of mineralogy and geology and a school of mining.

FAMA, in classical mythology, the personification of Rumour (Gr. *Φήμη*, "ὄσσα"). The Homeric equivalent *Ossa* (*Iliad*, ii. 93) is represented as the messenger of Zeus, who spreads reports with the rapidity of a conflagration. Homer does not personify *PHEME*, which is merely a presage drawn from human utterances, whereas *Ossa* (until later times) is associated with the idea of divine origin. A more definite character is given to PHEME by Hesiod (*Works and Days*, 764), who calls her a goddess; in Sophocles (*Oed. Tyr.*, 158) she is the daughter of Hope. According to Aeschines the orator (*c. Timarch.*, 128, *de falsa leg.* 145) and Pausanias (i. 17. 1) there was a temple of PHEME at Athens, but apart from this, she is a figure of mythical and poetical imagination rather than cult.

In Rome, Fama is purely a poetical figure (*e.g.*, Virgil, *Aen.*, IV., 173). The *Φήμη καὶ κληδὼν* of Plutarch (*Camillus*, 30, *de fert. Roman.*, 319 A) is simply *Aius Locutius*, misunderstood, *cp.* Livy, V., 50, 5.

FAMAGUSTA, a town and harbour on the east coast of Cyprus (Gr. *Ammochostos*), 2½ m. S. of the ruins of Salamis (*q.v.*). The population in 1901 was 818, nearly all being Muslims who live within the walls of the fortress; the Christian population has migrated to a suburb, Varosia (pop. 2,948). When Salamis (*q.v.* = Roman *Constantia*) was destroyed by the Arabs in A.D. 647, its Christian inhabitants settled at the neighbouring Arsinoe (*Ammochostos* "choked with sand") which had been built by Ptolemy Philadelphus in 274 B.C., and now became the seat of the orthodox archbishopric. Famagusta received many refugees at the fall of Acre in 1291; was annexed by the Genoese in 1376; reunited to the throne of Cyprus in 1464; and surrendered to the Turks in 1571 after a year's siege. The fortifications, remodelled by the Venetians after 1489, the castle, the grand Gothic cathedral of St. Nicolas (now a mosque) and the remains of the palace and many other churches testify to the mediaeval splendour of Famagusta. Acts ii. and v. of Shakespeare's *Othello* pass there, and the "Moor's Tower" is still shown. Since 1903 much has been done to develop the natural harbour and a light railway connects it with Nicosia (*q.v.*).

FAMILIAR, properly meaning belonging to the family or household, but in this sense the word is rare. The more usual meanings are: friendly, intimate, well-known. "Familiar" is also used as a substantive, especially of the spirit or demon which attended on a wizard or magician. The idea underlies the notion of the Christian guardian angel and of the Roman *genius natalis* (*see* DEMONOLOGY; WITCHCRAFT). In the Roman Church the term is applied to persons attached to the household of the pope or of bishops.

FAMILIARITY, in psychology, is defined as a feeling upon which follows closely recognition, so immediate, that its complex nature is hidden. This recognition is based upon subliminal association and there is consequently no need for the presence of mental images. Familiarity is therefore a developed "new" process of the mind, resulting from a fusion or combination of mental processes no longer individually felt. *See* ASSOCIATION OF IDEAS.

FAMILISTS, a term of English origin (later adopted in other languages) to denote the members of the "Family of Love," founded by Hendrik Niclaes who died probably in 1580. His calling was that of a merchant, in which he and his son Franz prospered, becoming ultimately wealthy. Not till 1540 did he

appear in the character of one divinely endowed with "the spirit of the true love of Jesus Christ." For twenty years (1540–1560) Emden was the headquarters at once of his merchandise and of his propaganda; but he travelled in both interests to various countries, visiting England in 1552 or 1553. Niclaes claimed to hold an impartial attitude towards all existing religious parties, and his mysticism, derived from David Joris, was undogmatic. Yet he admitted his followers by the rite of adult baptism, and set up a hierarchy among them on the Roman model (*see* his *Evangelium Regni*, in English *A Joyfull Message of the Kingdom*, 1574?; reprinted, 1652). His pantheism had an antinomian drift; for himself and his officials he claimed impeccability; but whatever truth there may be in the charge that among his followers were those who interpreted "love" as licence, no such charge can be sustained against the morals of Niclaes and the other leaders of the sect. The society spread in the eastern counties, in spite of repressive measures; it revived under the Commonwealth, and lingered into the early years of the 18th century; the leading idea of its "service of love" was a reliance on sympathy and tenderness for the moral and spiritual edification of its members. Thus, in an age of strife and polemics, it seemed to afford a refuge for quiet, gentle spirits and meditative temperaments.

See W. T. Whitley, article "Enthusiasts, religious" in Hastings, *Encyclopaedia of Religion and Ethics*; F. Loofs, article "Familisten" in Herzog-Hauck, *Realencyklopaedie*; F. Nippold, "H. Niclaes und das Haus der Liebe" in *Zeitschrift für die hist. Theol.*, 1862.

FAMILY. The family is a social unit based on the biological facts of procreation and the lengthy period of helplessness of offspring. Since it occurs as a purely instinctive grouping amongst many animals, it was in all probability the first group in the evolution of human culture to acquire a traditional form, out of which developed those more complex groups, such as the clan, common amongst primitive peoples at the present day.

Most speculation on the beginnings of human culture assume a sort of family, instinctively produced, as a basis. According to one view, this earliest form of family is a group led by a mature male, who dominated a number of females and children. Out of this "cyclopean family" developed all the later forms of the family, dependent on a variety of marriage-rules and differences in the mode of determining descent. Others have supposed the monogamous family, consisting of a man and his mate and their children, to be the earliest form. One school, as a reaction against the patriarchal theory, through the discovery of the widespread occurrence of matrilineal descent, denies the family in favour of original promiscuity.

Whether or not there has ever been a social organization lacking the institution of the family, the family can be detected as a fundamental unit in all societies, primitive or otherwise, that have so far been observed.

The family is here defined as a social group, consisting of one or more men living normally in the same habitation with one or more women, and the children, at least during their youth, that have resulted, or appear to be connected with their union. There are no clear instances of families in which several men cohabit with several women, though group-marriage (*q.v.*) has been postulated by several writers to explain certain features of relationship terminology, and certain customs of widespread occurrence. (*See* MARRIAGE and RELATIONSHIP TERMS.) Of the other three types of family, two at least have a wide distribution, the monogamous, in which one man is mated to one woman, and polygynous families, in which one man is mated to several women, while the polyandrous family, in which several men cohabit with one woman, is comparatively rare. (*See* POLYGYNY and POLYANDRY.)

The monogamous family is the usual type of family in every known society, though usually the polygynous family, confined to an upper class of the society, occurs alongside it. It is rare amongst primitives for the polygynous family to be entirely absent. Where, as a result of the development of great social differences within a society, polygynous families of great size occur, some of the more usual characteristics of the family group are lost.

Joint Family.—Although the family is typically a social group of great cohesiveness, consisting of a man and his wife or wives, and their children, it is often a wider group, containing, perhaps, husbands and wives of the children, as well as the children of these, and other relatives as well. The term "joint family" has been used when such family-groups are of normal occurrence in a society. The test of the occurrence of such family groups may be taken to be the common occupation of a habitation, though family groups of this kind can sometimes be detected in the absence of joint habitation.

The joint family may be either bilateral or unilateral, and the unilateral joint family may be either matrilineal or patrilineal. By bilateral is meant comprising relatives of both husband and wife; by unilateral, relatives of one side only by descent, which is matrilineal or patrilineal as the case may be. The patrilineal joint family is common in India, where a distinct family group is common, consisting of a man and his wives and children, together with his sons' children, and perhaps his father, or even grandfather. India also provides an example of the matrilineal joint family in the Nayers of Malabar, where the relations included are those of the wife instead of the husband.

Although the family as a definite social group, usually constituting a household, is always to be found in any society, the distribution and type of family groups occurring in any society depend on that part of the social organization which we may conveniently call the family grouping. The family grouping is something which is different for every member of a society; it is an orientation of individuals about himself, based on relationship, and is somewhat different for every member of even one and the same family group. It is, in connection with the family grouping, as distinct from family groups, that the terms matrilineal and patrilineal family have special significance, particularly in those cases where we do not have joint families, for the single family, as a group, obviously cannot be either matrilineal or patrilineal. Where the family grouping is matrilineal, the nearest members of a person's family will consist of many of the next relatives by direct matrilineal descent of his mother, and very few, if any, relatives of his father. Where the family grouping is patrilineal, the converse is the case. It is obvious that the possible variations in the nature of the family grouping are considerable, even under the same family groups of man and wife with their children.

Matrilocal and Patrilocal Marriage.—Where the grouping is strongly matrilineal, it is commonly found that the husband has come from his own village to take up residence with his wife in her village (matrilocal marriage), and the wife's brothers may have more significance to the children than the father himself; there are numerous instances of this in regions so far apart as Melanesia, Africa and North America. Conversely, where the grouping is strongly patrilineal, the relatives of the mother may count for nothing in the lives of the children—a state of affairs not rare amongst pastoral peoples and others who buy their wives. An intermediate type of grouping, with no more than a slight emphasis of the matrilineal or patrilineal side, is perhaps the commoner state of affairs; in south-east New Guinea, for example, we find a people with matrilineal descent, in which the family grouping could hardly be described as either matrilineal or patrilineal. This is well shown by the absence of any rule of residence, a family frequently dividing its time between residence in the village of the husband and residence in that of the wife.

Finally, it should be noted that, although family-groups may be small, a person's family may embody a very large number of persons, even if we confine the term to persons with whom genealogical relationship can be traced; and if we do not confine the term to genealogical relations—and there is no very good reason why we should—then, owing to the classificatory system of relationships (*q.v.*), which frequently occurs in primitive society, family relationships will be found to penetrate the whole tribe.

BIBLIOGRAPHY.—The family is treated in W. H. R. Rivers's *Social Organization* (1924), and R. H. Lowie's *Primitive Society* (1921), amongst other general works on sociology. A more special treatment of the family occurs in E. Westermarck's *History of Human Marriage*, 3 vols. (1921). An interesting detailed study of the family in one

particular area will be found in B. Malinowski's *The Family among the Australian Aborigines* (1913); see also *Sex and Repression in Savage Society*, 1927. The family is part of the subject-matter of a work, R. Briffault, *The Mothers*, 3 vols. (1927). (W. E. A.)

FAMILY PSYCHOLOGY

The psychology of the family is concerned with the problems and adjustments of human beings living in intimate association. The very nature of the family organization is dependent upon the limit of elasticity in such adjustments on the part of individual members of the group. Like other social institutions, the family is an outcome of mankind's efforts to find satisfaction for a multiplicity of desires. The history of the family is a record of collective learning, carried out by persons through untold time.

Fundamental, therefore, to an understanding of familial organization is knowledge of human nature, and particularly of the processes by which men learn. Much has been discovered about these processes during the present century. Observation of living creatures, experimentally caged and puzzled, has taught psychologists that learning proceeds only in dissatisfied organisms. A fundamental principle underlying all social institutions is derived from experimental study of the learning process: *a puzzled creature tends to learn as fixed habit whatever mode of action happens to bring relief from persistent cravings*. Social change occurs because some group of persons is unsatisfied. (E. L. Thorndike, *The Learning Process*, 1913.)

To what puzzle is the family, then, a solution? For purposes of ordinary reference, the human family consists typically of children and their parents, though it may include adopted persons, or more remote relatives such as grandparents. Briefly, the puzzle of the family has been how to win satisfaction of the appetites for food, sex, security, self-assertion, play and other urgent needs, and at the same time to carry the burden of involuntary reproduction. The manifold and often conflicting desires of men, of women and of children are involved, so that this puzzle has been and still is extremely complicated and difficult. In striving for a solution that will yield the maximum of satisfaction with the minimum of thwarting to all concerned, mankind has tried almost every possible form of familial organization. Like a caged kitten, mankind has done nearly everything that it can do. The form of the family obviously depends largely on the form of mating, and the history of human endeavour shows us (1) group marriage, scarcely different from promiscuity, in which all the men of a community live with all the women of that community and with the children produced by mating at will; (2) polyandry, in which one wife mates with several husbands, living simultaneously with all of them and with their children borne by her; (3) polygyny, in which one husband lives in a household with several wives, and forms a family with them and his and their children; (4) successive polygamy, as when a man or woman takes various mates in succession, after divorce; (5) monogamy, in which one man and one woman marry with the sanctioned formalities and live together with their offspring, as life-long mates. (G. E. Howard, *The History of Matrimonial Institutions*, 1904.)

The times and places in which these various forms of the family occur reveal certain characteristic features of food supply, depopulation, over-population, etc., which are thought by students of the subject to exert decisive influence. Whatever form is established in any given time or place is regarded by the folk as "right" and "the way." We find every kind of organization receiving sanction sometime, somewhere. (W. G. Sumner, *Folkways*, 1911.) Pair marriage, with monogamy as its ideal, seems most nearly in universal favour to-day as the best solution of the relationship between men and women in the family—best, that is, in the sense that it involves more satisfaction and less annoyance within the family than other forms, under conditions of human nature and of the environment as now existing. Powerful forces thus favour the unity of the family based on monogamy, but forces nearly as powerful work constantly for its disruption. (E. C. Parsons, *The Family*, 1906.) It is of interest to notice what these forces are.

FACTORS IN FAMILY LIFE

Considering first the forces which favour monogamous mating

and the familial organization resulting therefrom, we note that the sexes are numerically equal. It is true that more boys than girls are born, in a ratio of about 100 girls to 106 boys. However, mortality is slightly greater among males, so that in adulthood the sexes exist in numbers practically equal, taken the world over. This biological fact in itself favours pair marriage, since under polyandry or polygyny many are necessarily left mateless. Moreover, group marriage renders the paternity of children impossible of determination, and is so disfavoured by possessiveness and jealousy that after centuries of trial and error it is sanctioned scarcely anywhere at the present time, even among savages. Furthermore, it has long been known to be a biological fact that two and only two persons are required to co-operate for the perpetuation of the species. The rearing of offspring falls most naturally, perhaps, to the two who have produced them. Also mutual possessiveness, already mentioned, favours the family based on pair marriage, for man is constituted to resist encroachment upon property or privilege. Thus a man fights those who would possess "his woman," and a woman fights those who would possess "her man." These struggles to exclude competitors for favour would seem in the long run to work for pair marriage, as against other forms.

On the other hand, pair marriage with the monogamic ideal assumes that since there are enough mates for everybody, everyone can and will find a suitable mate. This assumption is not warranted by facts. There is not and never has been provided any adequate social machinery whereby young people might be enabled to make genuine choice, and to find each a suitable life-long mate. Moreover, the standard of living, by constantly rising, works to postpone marriage later and later. Thus a fairly large proportion of adults are at any given time unmarried, and the dissatisfactions and maladjustments arising from this situation affect society as a whole, and to the extent to which they are felt, work against monogamous marriage. Sexual instinct in human beings is not such that each person experiences a unique attraction during life. On the contrary, sexual impulse is in both sexes arousable by a variety of stimuli, regardless of ceremonial and legal restrictions. Mankind seems typically polygamous rather than monogamous by momentary impulse, however unfortunate for other aspects of life the satisfaction of such impulse may be. This fact perpetually threatens the family which is based on the ideal of life-long pair marriage. Furthermore, the desire for mastery over each other, individual differences in endowment, and a host of egoistic impulses, constitutionally latent in every person, work toward hostility and disruption, as the divorce courts prove.

However important the form of relationship between men and women may be for familial structure, it is really the child who chiefly determines how men and women shall live together. Except for reproduction, men and women might live in a great variety of social patterns, prompted only by individual differences in impulse and resources. The civilized family, founded upon pair marriage, with the husband as the head, and with the wife and children dependent upon his ability and bounty, was arrived at through struggling with the great sex difference in reproductive function. It must be remembered that until recently women were typically engaged throughout youth and maturity in conceiving, bearing, feeding, nursing, transporting and burying infants. From girlhood, women were physically attached to infants. The period of gestation for a human infant is long. Once born it must be carried upon the back and fed from the breast for a long time, under primitive conditions. Its birth constitutes an ordeal for the mother, in the course of which she may be crippled, at least for enough days to suffice for starvation unless ministered to by others. Human infants are conceived and borne in the course of nature at the rate of one each year or two, at any season, in the cold as well as in the warm, and they become quite heavy while still too immature to walk far or to run. (B. T. Baldwin, *Physical Growth from Birth to Maturity*, 1921.) How to master the uncertain food supply, ravenous wild beasts, hostile tribes, storms and cold is a hard puzzle for a creature carrying heavy children within and upon her body, year in and year out.

There is, nevertheless, a way to open this hard cage, that will lead to sustenance and shelter without sacrifice of the child. This way is to get the protection of those who are not cumbered with burdensome generative systems. Thus if men could be induced to supply subsistence, women could live without killing or abandoning their infants. At the same time, men were motivated by sex attraction, by the luxury of having routine labours performed for them, and doubtless by pity, to undertake the protection of women and of the helpless offspring to which they were mysteriously subject. Thus men, women and children came to be arranged in family groups, in which men were inevitably lords and masters, because they needed the arrangement least. The satisfaction of the mutual need for sex leaves men unhampered, while it leaves women weighted with the burden of gestation, child-birth and child care. (A. B. Parsons, *Woman's Dilemma*, 1926.)

It must be remembered that at the beginning of this long learning process, men knew no direct responsibility for the child. We have said that women were mysteriously subject to child-bearing. Knowledge of the true cause of child-birth had to be worked out by accumulation of records, comparison of observations and verification of inferences, just as in the case of any other scientific fact. It would almost certainly be a long time before human experience would establish the fact that sexual union is the invariable cause of procreation. Child-birth was originally ascribed to the influence upon mothers of the sun, the rain, the rivers and the trees. (E. S. Hartland, *Primitive Paternity*, 1910.)

The discovery of paternity undoubtedly modified woman's previously existing familial status in various ways. Men learning that they too were creators of children, realized also that in order to identify "his own flesh and blood" a man must ensure the strict fidelity of the mother to himself alone, in matters of sexual union. Special restrictions were thus imposed upon women, and a double standard of morals arose. In the earliest formulations of law, we find that "If the finger have been pointed at the wife of a man because of another man—for her husband's sake she shall throw herself into the river." No similar law required the husband to drown himself in like circumstances. (Code of Hammurabi, 2250 B.C.) With sound knowledge of the true source of infants, women could take steps toward limiting the number of births. The first step in the exercise of this new power was voluntary celibacy. Celibate women had time and energy to examine closely the family situation, to appraise woman's status therein, and to formulate diverse suggestions for mitigating some of the misfortunes due to her subordination. (K. Anthony, *Feminism in Germany and Scandinavia*, 1914.)

However, the almost sudden modification of woman's status, which the present generation witnesses, has come to pass not through feminist propaganda primarily, but through the works of persons who as a group were indifferent to the woman question. Inventors, men of science and philosophers created what is known as "the new woman," with a changing position in the family. During the 19th century, invention based on physics and chemistry harnessed power a thousandfold greater than the power of women's hands. Biologists studied the processes of reproduction, and devised scientific methods of birth-control other than celibacy. They wrought upon the origin of species and carried the conviction to high places that human beings had in the past undergone evolution, and therefore might in future continue to change. Philosophers in the meantime had developed naturalism, humanitarianism and pragmatism—all points of view favourable to the liberation of women as individuals, which science had been rendering practicable. (L. S. Hollingworth, "The New Woman in the Making," *Current History*, 1927.)

By the opening of the 20th century a "new woman" was trying to find place in the family. Freed at the same time from routine hand labour for the family and from incessant, involuntary maternity, married women in large numbers began to attempt differentiated occupation and economic independence. As a result of this breaking up of its formerly undifferentiated matrix, the family has begun to undergo internal modification and reflective scrutiny. Two chief problems now emerge as a result of woman's shift in power and attitude, i.e., the serving of food and the care

of young children. In cities the apartment hotel, the restaurant, the nursery school, the managing housekeeper and the trained nurse afford solutions more or less suggestive of ultimate satisfaction. In small towns and in the country these facilities are lacking as yet, and women still occupy the place which was traditional in the centuries immediately preceding ours.

The same influences that gave women increased power are also giving the child a modified status in the family. Psychology has developed scientific method during the half-century just elapsed. Child-study is one of the conspicuous concerns of modern psychology, offering new insight into child life, and a new respect for the child and for his right to be set free from the family at maturity. However, the increased value of the child, affording him increased dignity of status in the family, arises chiefly from new power over procreation, which renders the child less cheap and less to be taken for granted. As time goes on and all intelligent people gain the power of voluntary parenthood, the value of the child may well become such as to modify social attitudes in ways which we can at present but vaguely foresee. (*The Child: His Nature and His Needs*, The Children's Foundation, 1924.)

To summarize briefly the changes which are in progress in the modern family, we may say that parenthood is becoming a voluntary matter, wives are achieving economic independence in differentiated work, the double standard of morals is being condemned, and children are becoming less frequent and more valued. Our times bear witness to the living of many avowedly experimental lives, in the attempt to revise the family on the basis of new powers over nature. Studies are being compiled of families in which the wife and mother earns an independent salary. (V. M. Collier, *Marriage and Careers*, 1926.) From these studies it appears that men and women of intelligence and good will are consciously searching for a form of familial procedure in which the interests of men, women and children may all receive equal consideration. The outcome of the search is still uncertain.

Since the child is the core of the puzzle, since changes along the lines attempted depend upon voluntary maternity, and since methods of birth-control at present developed require intelligence and character for successful application, it follows that such changes will be confined at first and possibly for a long time to the unusually able. Whether the future will witness two kinds of familial pattern, one for the reflective, the other for the unreflective, or whether the unreflective will eventually change their "ways" through force of example, remains to be seen.

(L. S. H.)

FAMILY ALLOWANCES

The payment of allowances for children and sometimes for wives, grew up out of the economic conditions during and after the World War, though before that vestiges of it existed here and there in a few occupations, notably in agriculture, where payments in kind varying with the size of the labourer's family have long been general in most countries. During the war all the belligerent States paid allowances for the wives and children of the men in the fighting services, and in the public services of most European countries the war bonuses made necessary by the rise in prices were proportioned in some way to the size of the worker's family, or at least differed for married and unmarried. Probably these two war customs prepared the way for the rapid development which has followed in some countries.

In the services of the State and of local authorities the payment of allowances for children has become established in all European countries except Great Britain, Portugal, Spain and Russia. The Federal Government of Australia gives the children of its employees an allowance of 5s. a week until the age of 14. In several of these countries (e.g., Switzerland and Italy) attempts have been made, so far unsuccessfully, to drop the payment as conditions became more normal.

The allowances do not vary with the remuneration of the worker, except in Holland, where they are expressed as a percentage of his salary, with a minimum and a maximum. Everywhere the allowances represent only a small part of the cost of a child; being on a flat rate they are more important to the lower paid than to the higher paid officials. They are paid up to the age of

18 (in Germany 16); later, if education is continued.

In America, there is a growing interest in the subject of family allowances. A movement is on foot in Canada urging upon the Federal Government of that country the advisability of passing, as soon as possible, a family allowance law applicable to the whole Dominion.

In the United States, an investigation of "Family Allowances in Foreign Countries" has been carried on by the Federal Bureau of Labor Statistics, and the results published in its *Bulletin* 401 (Washington, 1926).

Next to the public services, mining is the occupation where the system is most widely established. It is practically universal in the mining industry of France and Belgium, and is in operation in some of the mining districts of Germany, Holland, Czechoslovakia, Poland and Sweden. Here, as elsewhere, the allowance represents only a contribution towards child maintenance. In most countries the married workers' privileges include coal and in some a house free or at a low rate.

The System at Work.—In other industries, the family allowance system is widely extended only in France and Belgium, though there are instances of it in other countries.

In France its development has been greatly helped by the device of the equalization fund (*Caisse de Compensation pour allocations familiales*), which guards successfully against the danger that family allowances paid for by employers might prejudice men with families in obtaining employment. Such funds were first proposed in 1918 by M. Romanet, a benevolent Roman Catholic employer of the metallurgic industry of Grenoble. The idea spread rapidly, and in May 1927 there were 210 equalization funds in France, covering over 16,200 firms and 1,420,000 workers. Twenty-seven of the funds were agricultural. The method is simple:—The fund may be either "professional," i.e., confined to a single industry or kind of occupation, or "regional and inter-professional," i.e., open to all employers who desire to join within a given area. The scale of allowances (which varies considerably in different funds) having been fixed, the number of children covered is ascertained at fixed periods, and each adherent employer is assessed for his share of the cost, the assessment being based either on the amount of his wage-bill, the number of his workers, or the number of hours worked. When the number of workers is the basis, some funds fix a lower scale for women and youths than for adult male workers. Some funds actually pay the allowances to the parents; in others the employer pays and subsequently claims from the fund the excess, or pays into the fund the deficiency of his payment over the sum due from him.

The allowances are usually paid monthly and, in an increasing proportion of funds, not to the workman but to the children's mother. It is found that this method is not only more certain to benefit the children, but less apt to arouse the jealousy of the single man, who is thus led to regard the allowances, not as an addition to wages, and thus an infraction of the principle of equal pay for equal work, but as a recognition of the separate service of parenthood. The desire for an increased population is shown by the grading of the allowances upwards, e.g., in May 1927 the rates of allowances averaged 27 francs per month for one child, 67 for two children, 115 for three, and 181 for four. In the leading funds the rates rise to 60 francs for one, 150 for two, and 240 for three children. Figures for the metal and allied industries fund in the Paris district, covering 200,000 workers, showed that the allowance for one child amounted to about 4% of wages, for two children to 10%, and for five to 40%. Many funds also pay bonuses at childbirth (*primes de naissance*) and during the period of lactation (*primes d'allaitement*). Many maintain subsidiary health services, such as health visitors, day nurseries, convalescent homes, etc.

The cost of the allowances to employers varies from 1 to 7% of the wage-bill. Including the public services, mines, railways and other large enterprises, which pay allowances directly, the number of workers covered in May 1927 was reckoned at 3,700,000, and the annual cost of the allowances at 1,318 million francs.

The system is increasingly popular with employers, who find their reward in the increased well-being and contentment of their

workers. The attitude of the trade unions has changed from one of suspicion to a definite and cordial acceptance of the principle, coupled with resentment of employers' control and demand that it shall be made universal, compulsory and collectively controlled.

In Belgium, the methods adopted are modelled closely on those of France. Progress began several years later, but has been rapid; and the system appears equally destined to become a permanent part of industrial life, welcomed both by employer and employed. In his report for 1925, the British commercial secretary attributed the freedom of the country from industrial strife partly to this cause and said:—"It is almost generally admitted now that the family bonus system is of real economic value, and that by improving the present and future conditions of the working class it is capable of exerting a direct and beneficial influence on the prosperity and producing capacity of the country."

In Germany, during the five years following the World War the payment of family allowances was probably as common as in France but much less generally popular. Employers tended to regard the allowances as a temporary addition to wages which could be dropped when conditions became more normal. Hence few equalization funds were started, and the allowance being paid to the worker with his wage was apt to excite the single man's jealousy, while the married man feared to be prejudiced in seeking work. In 1925 the number of collective agreements containing family allowances showed a falling off. It is not yet certain whether the tendency will be permanent.

Scattered instances of equalization funds and of allowances paid by individual firms are to be found in Holland, Poland, Austria and Palestine, and to a minor extent in Czechoslovakia, Greece, Rumania and Switzerland.

In New Zealand a Family Allowance Act was passed by a Conservative Government in 1926 and came into force in April 1927. The allowance amounts to 2s. per week per child under 15 in excess of two children per family, up to income limit of £4 per week plus any sum payable under the act. The cost has been estimated at £200,000 per annum.

In Australia, since 1907, wages have been subject to a legal minimum, settled by the courts and supposed to be roughly based on the needs of the "normal" family of five persons (four persons in New South Wales). In 1919, owing to the discontent caused by rising prices, a Royal Commission on the basic wage, composed of equal numbers of representatives of employers and employed with an impartial chairman, was set up to determine what was the actual cost of maintenance of a five-member family at a standard of reasonable comfort. The sum fixed for each of the five states averaged £5 16s., the existing basic wage being then £4. The Commonwealth statistician promptly reported that the whole produced wealth of the country would not yield the amount that was necessary. The chairman of the commission, A. D. Piddington, then submitted the proposal that the basic wage should be based on the needs of man and wife and supplemented by an allowance of 12s. per week for each child, paid out of a State fund to which each employer should contribute 10s. 9d. a week per employee. He pointed out that the ordinary conception of the basic wage postulated 2,100,000 non-existent children, the total number of actual children (under 14) of employees being 900,000. The only actual fruit of this proposal, up to 1926, was the aforesaid 5s. allowance paid for each child of a Commonwealth employee. In June 1927 a Conference of State Premiers referred the question to a Royal Commission. Meanwhile a Child Endowment Act was passed in New South Wales in March, 1927, providing for allowances of 5s. per week per child under 14 (up to 16 if incapacitated from earning). Allowances are not payable when the previous year's income exceeds the basic wage plus £13 for each child. The basic wage, assessed on the requirements of man and wife, amounted to £4 5s. per week in Oct. 1927. It is estimated that the endowment will cover 396,000 children at a cost of approximately five millions. This cost is met by a levy on employers amounting to 3% of wages-bill.

Although Great Britain possesses the earliest equalization fund in existence (in fact though not in name) in that established about a century ago by the Wesleyan community for children of minis-

ters, and although allowances for children are also paid in the United and Primitive Methodist Churches and in a few dioceses of the Church of England, the family allowance system has so far not taken much root in the country, except in the fighting service. The subject, however, has been widely discussed since the development of the foreign schemes. It is significant of its growing hold on public opinion that during 1925 the London School of Economics introduced substantial educational allowances for the children of its professorial staff, the Independent Labour Party adopted as part of its programme a state scheme of children's allowances, and the Coal Commission report recommended such allowances as "one of the most valuable measures that could be adopted for increasing the well-being and contentment of the mining population."

The Case for Family Allowances.—Advocates of the principle contend that as the national income or dividend is an uncomfortably tight fit, it will be impossible to satisfy the general demand for a reasonably high standard of life so long as the needs of the family during the years of its greatest dependency are only met through a wage paid equally to the childless man. They further argue that the value of children to the community, as its future citizens and workers, is not adequately recognized by a system which assigns to the family unit an income no larger than that enjoyed by the single individual; that as a result the more thoughtful and ambitious workers are tending drastically to restrict their families, while the less thoughtful and less ambitious practice no such restriction. To this is added the plea that the maximum production of wealth will only be achieved when competition between men and women workers is at once free and fair; and that this is impossible without "equal pay for equal work," and that this again is impracticable until family responsibilities are met by family allowances.

There is a division of opinion among advocates of family allowances in Great Britain between those who prefer the foreign system of equalization funds paid for by employers, those who would like to see family allowances provided through contributory insurance, and those who believe that the whole cost should be met by the State.

FAMINE, extreme and general scarcity of food, causing distress and deaths from starvation among the population of a district or country (Lat. *fames*, hunger). The causes of famine are partly natural and partly artificial. Among the natural causes may be classed all failures of crops due to excess or defect of rainfall and other meteorological phenomena, or to the ravages of insects and vermin. Among the artificial causes may be classed war, and economic errors in the production, transport and sale of food-stuffs, etc.

The natural causes of famine are still mainly outside our control, though science enables agriculturists to combat them more successfully, and the improvement in means of transport allows a rich harvest in one land to supplement the defective crops in another. In tropical countries drought is the commonest cause of a failure in the harvest, and where great droughts are not uncommon—as in parts of India and Australia—the hydraulic engineer comes to the rescue by devising systems of water-storage and irrigation. It is less easy to provide against the evils of excessive rainfall and of frost, hail, and the like. The experience of the French in Algiers shows that it is possible to stamp out a plague of locusts, such as is the greatest danger to the farmer in many parts of Argentina. But the ease with which food can nowadays be transported from one part of the world to another minimizes the danger of famine from natural causes, as we can hardly conceive that the whole food-producing area of the world should be thus affected at once. (See GRAIN PRODUCTION AND TRADE; TROPICAL AGRICULTURE; IRRIGATION.)

Great Famines.—Amongst the great famines of history may be named the following:—

B.C. 436	Famine at Rome, when thousands of starving people threw themselves into the Tiber.
A.D. 42	Great famine in Egypt.
650	Famine throughout India.
879	Universal famine.
941, 1022 and 1033	Great famines in India, in which entire provinces were depopulated and man was driven to cannibalism.
1005	Famine in England.
1016	Famine throughout Europe.
1064-1072	Seven years' famine in Egypt.
1148-1159	Eleven years' famine in India.
1162	Universal famine.
1344-1345	Great famine in India, when the Mogul emperor was unable to obtain the necessaries for his household. The famine continued for years and thousands upon thousands of people perished of want.
1396-1407	The Durga Devi famine in India, lasting 12 years.
1586	Famine in England which gave rise to the Poor Law system.
1661	Famine in India, when not a drop of rain fell for two years.
1769-1770	Great famine in Bengal, when a third of the population (10,000,000 persons) perished.
1783	The Chalisa famine in India, which extended from the eastern edge of the Benares province to Lahore and Jammu.
1790-1792	The Doji Bara, or skull famine, in India, so called because the people died in such numbers that they could not be buried. According to tradition this was one of the severest famines ever known. It extended over the whole of Bombay into Hyderabad and affected the northern districts of Madras. Relief works were first opened during this famine in Madras.
1838	Intense famine in North-West Provinces (United Provinces) of India; 800,000 perished.
1846-1847	Famine in Ireland, due to the failure of the potato-crop. Grants were made by parliament amounting to £10,000,000.
1861	Famine in North-West India.
1866	Famine in Bengal and Orissa; 1,000,000 perished.
1869	Intense famine in Rajputana; 1,500,000 perished. The government initiated the policy of saving life.
1874	Famine in Behar, India. Government relief in excess of the needs of the people.
1876-1878	Famine in Bombay, Madras, and Mysore; 5,000,000 perished. Relief insufficient.
1877-1878	Severe famine in north China; 9,500,000 said to have perished.
1887-1889	Famine in China.
1891-1892	Famine in Russia.
1897	Famine in India. Government policy of saving life successful. Mansion House fund £550,000.
1899-1901	Famine in India; 1,000,000 people perished. Estimated loss to India £50,000,000. The government spent £10,000,000 on relief, and at one time there were 4,500,000 people on the relief works.
1905	Famine in Russia.
1916	Famine in China.
1921	Famine in Russia.

Famines in India.—Owing to its tropical situation and its almost entire dependence upon the monsoon rains, India is more liable than any other country in the world to crop failures, which upon occasion deepen into famine. Every year sufficient rain falls in India to secure an abundant harvest if it were evenly distributed over the whole country; but as a matter of fact the distribution is so uneven and so uncertain that every year some district suffers from insufficient rainfall. In fact, famine is, to all intents and purposes, endemic in India, and is a problem to reckon with every year in some portion of that vast area. The people depend so entirely upon agriculture, and the harvest is so entirely destroyed by a single monsoon failure, that wherever a total failure occurs the landless labourer is immediately thrown out of work, and remains out of work for the whole year. The question is thus one of lack of employment, rather than lack of food. The food is there, perhaps at a slightly enhanced price, but the unemployed labourer has no money to buy it. The problem is very much the same as that met by the British Poor Law system.

Famines seem to recur in India at periodical intervals, which

have been held to be in some way dependent on the sun-spot period. Every five or ten years the annual scarcity widens its area and becomes a recognized famine; every 50 or 100 years whole provinces are involved, loss of life becomes widespread. In the famine of 1901, the worst of recent years, the loss of life in British districts was 3% of the population affected, as against 33% in the Bengal famine of 1770.

The native rulers of India seem to have made no effort to relieve the sufferings of their subjects in times of famine; and even down to 1866 the British government had no settled famine policy. In that year the Orissa famine awakened the public conscience, and the commission presided over by Sir George Campbell laid down the lines upon which subsequent famine-relief was organized. In the Rajputana famine of 1869 the humane principle of saving every possible life was first enunciated.

Fighting Indian Famine.—The measures by which the government of India chiefly endeavours to reduce the liability of the country to famine are the promotion of railways; the extension of canal and well irrigation; the reclamation of waste lands, with the establishment of fuel and fodder reserves; the introduction of agricultural improvements; the multiplication of industries; emigration; and finally the improvement where necessary of the revenue and rent systems. In times of famine the function of the railways in distributing the grain is just as important as the function of the irrigation-canals in increasing the amount grown. There is always enough grain within the boundaries of India for the needs of the people; the only difficulty is to transport it to the tract where it is required at a particular moment. Owing to the extension of railways, in the famines of 1898 and 1901 there was never any dearth of food in any famine-stricken tract; and the only difficulty was to find enough rolling-stock to cope with the demand. Irrigation protects large tracts against famine, and has immensely increased the wheat output of the Punjab; the Irrigation Commission of 1903 recommended the addition of 6½ million acres to the irrigated area of India, and that recommendation was carried out.

As five-sixths of the whole population of India are dependent upon the land, any failure of agriculture becomes a national calamity. If there were more industries and manufactures in India, the dependence on the land would not be so great and the liability to lack of occupation would not be so uniform in any particular district. The remedy for this is the extension of factories and home industries which is a work of time.

On the question of a possible famine in the world's natural resources, see NATURAL RESOURCES, CONSERVATION OF.

FAN, in its usually restricted sense denotes a light instrument held in the hand and used for raising a current of air to cool the face. Among the ancients the fan was also known as a winnow, as a bellows for fire and as a fly whisk. Modern usage also applies the word to an instrument for winnowing grain (winnowing fan) and to various appliances in systems of ventilation. (See FANS.)

In the more familiar sense the forms of the fan may be divided into two main groups—the screen fan and the folding fan. In gen-

FANS OF THE 18TH CENTURY

1. Cabriolet fan, with mounts of painted skin, sticks and guards of painted ivory. This type of folding fan was in vogue about the middle of the reign of Louis XV. It was named after the light two-wheeled carriage, popular in France at that time, which is often represented in the scenes painted or engraved on the mounts
2. Mask fan, popular in Spain during the middle of the 18th century. The leaf is of painted skin and the guards and sticks are carved and painted
3. Fan of painted skin with ivory sticks and guards, used in France during the third quarter of the 18th century
4. Vernis-Martin fan. This variety is one of the rarest and most sought after by collectors. The name is derived from the translucent varnish accidentally discovered by the brothers Martin, French coach painters, while they were attempting to imitate Japanese lacquer. The painting on the fan reproduced is attributed to Boucher
5. Elaborate French fan of the 18th century. On the parchment leaf are painted the figures of Louis XVI., Marie Antoinette, the princess royal and the dauphin. This fan, a product of the period when the most extravagant and luxurious ornament was in vogue, has sticks and guards made of carved and gilded mother-of-pearl

JAPANESE AND INDIAN FANS OF THE NINETEENTH CENTURY

1. Japanese fan with a paper mount, painted by Hokusai. The sticks and guards are of wood
2. Japanese brisé fan of ivory sticks decorated on both sides with lacquer
3. Indian brisé fan of lacquered ivory sticks

eral the former consists of a handle to which is attached a rigid mount; except feather fans, which may be included in this class, the usual mount is made of straw, cane, silk, parchment, etc., and is square, circular, pear or leaf shaped. In some cases the mount is placed at one side, producing a flag-like form, such as the Venetian type of the 16th century, which was also known to the Copts of the early Christian era. The so-called cockade fan, which, as its name implies, has a circular pleated mount that may be folded flat, also belongs to this group. Types of the screen fan are to be found throughout the world in all periods, among both primitive and highly civilized peoples. The folding fan, although the better-known form, has a more circumscribed history. It is said to have been invented in Japan about A.D. 670. It was introduced into China in the 10th century and thence into Europe in the late 15th or early 16th century, probably at the time when the Portuguese under Vasco da Gama established themselves as the supreme trading power in the East. The folding fan is composed of sticks and a mount. The sticks are a number of blades, the one at each end being a guard; they may be ivory, mother-of-pearl or various woods, pierced, carved and often ornamented with inlay and gilding; all are fastened at the handle-end by a pin or rivet. The mount (or leaf), is pleated and stretched over the blades at the top, it may be made of paper, parchment, silk, lace and "chicken-skin" (an especially prepared kid-skin) or other materials, and is usually decorated with painting. A variant of the folding fan, popular in France in the 18th century, is the cabriolet, which will be described later. The distinguishing feature of the *brisé* fan is that it has no mount but is composed of a number of blades fastened at the handle-end by a rivet and radiating toward the top where they are connected by a ribbon; the delicately carved ivory fans of China are exquisite examples of this type.

China.—The fan of the Far East is the most ancient known to us and is a separate chapter in the history of the instrument. Some authorities testify that in China fans have been known since about 3000 B.C. The earliest form was of dyed pheasant or peacock feathers mounted on a handle. Cockade fans and large ceremonial screens are also of ancient origin while the small hand-screens of various shapes, made of palm, bamboo and silk stretched on a frame, have been in use from ancient to modern times. Ivory fans seem to have come into being shortly after the folding fan was introduced into China. The Imperial ivory works within the palace at Peking were founded in the 17th century and became the centre of the best productions. The delicacy of carving in ivory *brisé* fans can hardly be overestimated. Sometimes the decoration is made up of pierced, flat, open work, sometimes of elaborately carved figure or floral subjects with a background formed by ribbing of exquisite quality. Tortoise-shell was used in a similar way, also sandalwood and mother-of-pearl. Filigree fans of silver or silver gilt frequently inlaid with enamel form another variation. A class of Chinese folding fan often seen is the mandarin fan with sticks of carved ivory and the leaf painted with innumerable minute figures with ivory heads and silk costumes applied. Almost every city or district in China has its characteristic fan distinguishable by its colour and ornament and made to suit every class from mandarin to peasant.

Japan.—In Japan also the use of the fan is very closely linked with the life and customs of the people. In Rhead's *History of the Fan* the author says that it is regarded as an emblem of life, widening and expanding as the sticks radiate from the rivet. It plays a part in almost every aspect of their existence: it is presented to the youth on the attainment of his majority; it is used by jugglers in feats of skill; the condemned man marches to the scaffold fan in hand. The earliest examples were made of palm leaves or feathers while the rigid screen fans were introduced from China in the 6th century A.D. Large screens were used for religious and civil ceremonial and as war standards. Most interesting of all the rigid fans is the Gumbai Uchuia, a type of battle fan of iron first known in the 11th century. It is, however, the folding fan, invented by the Japanese in the 7th century, that has played such an important role in their history and art. There are innumerable variations of its form each designed for a particular use and possessing individual characteristics. The Akomé Ogi is

the earliest form of court fan having come into use in the 7th century; it is composed of 38 blades fastened with a rivet, formed of a bird or butterfly, and ornamented at the corners with artificial flowers and 12 long streamers of coloured silks; it was the type used by court ladies until 1868. The Gun Sen is the folding battle fan with sticks of wrought iron and the mount of thick paper painted with the sun, moon or star in red or gold on a black or coloured ground; its initial purpose in battle was as a signal. The Mai-Ogi or dancing fan dates from the 17th century; it has 10 sticks and a mount of thick paper usually decorated with a family crest. The Rikin-Ogi or tea fan, used in tea ceremonies celebrated in each province on the first day of every month, has only three sticks and the paper mount is simply decorated, the fan itself being used for handing around little cakes, fanning being prohibited during this dignified ceremony. Many early fans were designed with the infinite artistry of the great painters of Japan but these are rarely seen to-day. Those most often found in collections are the modern *brisé* of ivory or tortoise-shell decorated with lacquer and inlay and often made for exportation to Europe. (See DRESS: *Eastern*.)

Ancient.—In the cultures of ancient Egypt, Assyria and India, the fan achieved considerable importance both as a civil and religious emblem. Especially in Egypt fans played an important part in royal ceremony; the office of fan-bearer to the king was a highly prized honour; their fans, made of feathers arranged in a half-circle and mounted on long handles, may be seen in Egyptian wall paintings and reliefs. Two actual examples now in the museum at Cairo, were found in the tomb of Tut-ankh-amen (14th century B.C.); the gold mounts with embossed and incised decorations were fitted with brown and white ostrich plumes and the handles were made in one case of gold and in the other of ebony overlaid with gold and lapis-lazuli. In India both the fan and umbrella were held in reverence; the punkah or large screen fans are still hung in rooms and manipulated by servants detailed for the purpose. In Greece peacock feather hand fans were known about 500 B.C. and may be seen in contemporary vase paintings while the rigid palm leaf shaped fan is frequently depicted in the terracotta figurines from Tanagra. As for ancient Italy, an Etruscan cinerary urn in the Metropolitan Museum of Art shows the deceased in the customary reclining posture holding in her hand a feather fan; and in Rome tablet fans of precious woods or finely cut ivory were carried by the exquisites on the Via Sacra for their ladies, while another type was always part of the bridal outfit of a Roman woman.

Mediaeval.—In the Middle Ages the Christian Church perceived the usefulness of the fan in religious ceremonials. The *flabellum*, as it was called, a disc sometimes of silver or silver gilt mounted on a long handle, was held by deacons and used to drive away flies and insects from the sacramental vessels. Accounts of the *flabellum* occur repeatedly in the old inventories of church and abbey property but except for two, whose use was probably secular, no fans of the period exist to-day. With the exception of the large leather fan carried in state processions for the pope, the fan is no longer used in the Western Church, but it still appears in the rites of the Eastern Church. The two famous specimens mentioned above, of the mediaeval period, are of the cockade type with mount of vellum and handle of carved bone. One of these dating from the 11th century from the abbey church of Tournus is now in the National museum at Florence while the other, said to be the oldest existing Christian fan and identified with Theodolinda, queen of the Lombards, is now preserved as a sacred relic in the cathedral of Monza near Milan, where superstition has invested it with magic powers.

Modern European.—The vogue of the folding fan in Europe dates from its introduction through Portuguese trade connections with India and the Far East in the 16th century. Although it may have been known earlier, the impetus supplied by oriental importations produced a new era in its evolution. In popularity it soon supplanted the feather fan mounted on a carved ivory handle and the Venetian flag-like instrument. The type of folding fan found in late 16th century portraits is about a quarter circle in shape with sticks of ivory and a mount composed of alternate strips

of vellum and mica, or of vellum cut out in a geometrical pattern of circles and lozenges similar to the designs of reticello lace of the period. Of this kind, called *découpé* from the perforated vellum mount, there is a beautiful example in the Cluny museum and one almost identical in a private collection in New York. It was at this time that the vogue for fans, already general in Italy and Spain, spread to France and England. Although not then confined to the use of ladies, special conventions were developed and gestures in handling them grew into code signals of amorous import.

In the 17th century Paris became the centre for the manufacture of fans. Louis XIV. issued edicts at various times for the regulation of the industry and in 1678 the Fanmakers' Guild was formed. The revocation of the Edict of Nantes (1685) drove many fanmakers to England and Holland. In consequence a fan trade was established in England where, after the formation of the Fanmakers' Company (1709), the importation of foreign fans, especially from India and China, was for a time prohibited. During this period the shape of the fan gradually grew to a full semi-circle with sticks of ivory or mother-of-pearl pierced or carved. The mounts of paper, vellum, parchment and specially prepared kidskin were painted or engraved, often from designs of such artists as Lebrun, Romanelli, Abraham Bosse and Callot.

It was, however, in the 18th century that the most extravagant and luxurious ornament was expended upon the decoration of the fan. The delicately carved sticks of ivory and mother-of-pearl, sometimes the product of Chinese workmen in Europe, were further enriched with incrustations of gold, silver, enamel and jewels. The mounts were made not only of skin but of silk, lace and paper perforated in imitation of lace, while the suave and gracious designs with which they were painted followed the fashion set by the chief artists and decorators of the day. As it was an age of considerable decorative invention, it is not surprising that new forms of the folding fan should appear. One of the rarest and most sought after by collectors is the so-called Vernis Martin. In form this type of fan is an ivory *brisé*, the blades of which are painted in thin oils and then varnished. It is from the particular translucent varnish that the name is derived, for in attempting to imitate Japanese lacquer, the brothers Martin, coach painters by trade, accidentally developed a method suitable for this decoration. Vernis Martin fans are smaller in size than the usual type of the period and because of their interest to collectors many imitations have been made. About the middle of the reign of Louis XV. another type of folding fan, the *cabriolet*, became the vogue. This was a reflection of the immense popularity achieved by a light two-wheeled carriage introduced to Paris by Josiah Child in 1755. For such fans, the mount instead of being one broad strip, was composed of two or sometimes three narrow strips with an intervening space between them. The strips were then painted or engraved with small scenes which usually included representations of people driving about in the fantastically popular carriage itself.

Toward the end of the reign of Louis XV. the fan industry suffered from a vogue for cheap printed fans. The sticks were thin and often undecorated, the printed paper mounts frequently depicted incidents and personages connected with contemporary political events. Some of the most interesting of these fans commemorate the balloon ascensions of 1784 and 1785 and the meeting of the Estates General in 1789. Other more pretentious fans of the period were much ornamented with spangles and tinsel, often with cheap effect. In England at this time there developed a particular type of ivory *brisé* fan—the ivory pierced and decorated with medallions painted in miniature in the style of Cosway or Angelica Kaufman.

During the period of the First Empire fans retrieved very little of their past elegance. They were small, delicate instruments often with mounts of spangled gauze and sticks of pierced ivory. The lorgnette fan, a variant of the cockade form, was made of pierced horn or ivory and had a little glass inserted at the rivet. As the century advanced the romantic and antiquarian tastes of the Victorian era were reflected in the style and decoration of fans. There was much lifeless imitation of the Louis XV. types,

and there were many large fans with mounts of lace or, frequently, paper with coloured lithographic prints of romantic scenes. The sticks of mother-of-pearl were pierced and gilded and, except in rare cases, were coarse in both design and execution. The invention of Alphonse Baude in 1859 for carving sticks by machinery reveals the lack of taste and discriminating quality of the time, for no mechanical contrivance can duplicate the verve of hand-carving. Somewhat later, however, certain fan-makers attempted to revive the old distinction of design and workmanship. Exhibitions were held in Paris and at South Kensington (1870) and painters of repute made designs for fan mounts, among whom may be cited Gavarni, Diaz, Couture, Solde, Jacquemart and Charles Condor (1868-1900) (*q.v.*).

FANCY, display, showing forth, as a philosophical term, the representative power of the mind. "Fancy" is a shortened form of the older "phantasy" and dates from the 15th century. (Derivation is through the O.Fr. *fantasie*, mod. *fantaisie*, from the Latinized form of the Greek *φαντασία*, *φαντάζω*, *φαίνω*, to show). The older form "fantasy," which is now chiefly used poetically, was in its early application synonymous with imagination, the mental ability to form representations or images of things not present to the senses; it is more usually, in this sense, applied to the lighter forms of the imagination. "Fancy" also commonly means inclination, whim, caprice. The more learned form, "phantasy," as also such words as "phantom" and "phantasm," are chiefly confined to visionary imaginings.

FANFARE, in music, a short phrase or passage of a bold and rousing character played unaccompanied by a brass instrument or instruments, usually the trumpet, more especially on festive or ceremonial occasions.

FANG, an African tribe occupying the Gabun district north of the Ogowé river in French Congo. The name means "men." They call themselves *Paⁿwe*, *Faⁿwe* and *Faⁿ* with highly nasalized *n*. They are a finely-made race of chocolate colour; some few are very dark, but these are of slave origin. They have bright expressive oval faces with prominent cheek-bones. Many of them file their teeth to points. Their hair, which is woolly, is worn by the women long, reaching below the nape of the neck. The men wear it in a variety of shapes, often building it up over a wooden base. The growth of the hair appears abundant, but that on the face is usually removed. Little clothing is worn; the men wear a bark waist-cloth, the women a plantain girdle, sometimes with a bustle of dried grass. A chief wears a leopard's skin around the shoulders. Both sexes tattoo and paint the body, and delight in ornaments of every kind. The men fight and hunt, carry muskets, spears for throwing and stabbing and throwing-knives with blades broader than they are long. They use crossbows made of ebony to hunt apes and birds. In battle the Fang used elephant hide shields; now apparently discarded.

In 1815 the Fang were an inland people inhabiting the hilly plateaus north of the Ogowé affluents, now south of the Gabun they have reached the sea at several points. Their language is of the Bantu family. The Fang were noted cannibals. Among certain tribes the aged alone were permitted to eat human flesh, which was tabu for all others. The Fang are skilful workers in iron and have a curious coinage called *bikéi*, little iron imitation axeheads tied up in bundles called *ntei*, ten to a bundle; these are used chiefly in the purchase of wives. They are energetic traders and are skilled in pottery and in gardening. Their religion appears to be a combination of primitive animism and ancestor worship, with a belief in sympathetic magic.

JAPANESE FOLDING FANS

Top: Fan painted by Ogata Kenzan. Illustrating a type of folding fan widely used in Japan, having ten sticks and a decorated mount of thick paper

Bottom: Japanese folding fan, painted by Sakai Hoitsu. Fans are often regarded in Japan as an emblem of life, widening and expanding as the sticks radiate from the rivet

FANO, a coast town and episcopal see of the Marches, Italy (anc. *Fanum Fortunae*, *q.v.*) province of Pesaro and Urbino, 8 m. S.E. of Pesaro by rail, and 46 ft. above sea-level. Pop. town, 11,689, commune 28,538. S. Croce and S. Maria Nuova contain pictures by Giovanni Santi, the father of Raphael. S. Agostino contains a painting of the Angelo Custode ("the Guardian Angel") by Guercino which is the subject of a poem by Robert Browning. The fine Gothic Palazzo della Ragione (1299) has been converted into a theatre. The palace of the Malatesta has fine porticos and Gothic windows; and there is also an imposing citadel built by them. S. Michele, built against the arch of Augustus, is an early Renaissance building (1475-1490), probably by Matteo Nuzio of Fano, with an ornate portal.

Mediaeval Fano had a chequered story and in the 14th century became subject to the Malatesta. In 1463 Pius II. added it to the states of the Church. Julius II. established here in 1514 the first printing press with movable Arabic type. The harbour was restored by Paul V.; Fano is a favourite sea bathing resort.

FANS are devices for setting air or gases in motion. Mechanical contrivances for this purpose are a necessity in a great number of manufacturing processes. For ventilating, warming or cooling buildings, ships and mines, air must also be propelled large volumes. In cases where a blower or blowing engine (*q.v.*) is not required to give pressures above the range of a fan, the latter is employed, reaching in capacity from the tiny table fans to the huge mine fans requiring over one thousand horse-power to drive. The hand fans and the punkahs do not actually bring fresh volumes of air but only keep in motion the air in the neighbourhood. A rotary fan transfers air or gases completely from one location to another. It may be a blowing fan or an exhausting one, according to the purpose desired, and it may move solid matter along with the air, as dust, wood and other shavings, and powders and woolly substances.

Fans are divisible into two classes, the *screw* or *propeller* type and the *centrifugal* or *impeller* type. The former acts on the principle of the inclined plane, the latter by centrifugal force created in the air which revolves with the impeller wheel. Propeller fans will move large volumes of air, but they are mostly used with "free air," that is, little or no resistance must be caused by piping, flues, etc., or the efficiency of the fan rapidly drops.

FIG. 1.—ELECTRICALLY DRIVEN PROPELLER FAN, DESIGNED TO MOVE LARGE VOLUMES OF AIR AGAINST LITTLE RESISTANCE. WHERE PIPING PREVENTS FREE FLOW THE CENTRIFUGAL FAN MUST BE USED

Hence it is often called a *volume fan*. The simplest design is that of the ceiling fan, depending from a vertical hanger, carrying at the bottom end the electric motor and the fan blades, two, three or four in number. The motor may be pivoted so as to vary the direction of the flow of air. Desk or bracket fans are on a pillar, and the blades are protected with a wire guard; automatic oscillation is often included to increase the area of influence. Types for affixing to a wall or window or partition or for placing in a duct comprise a frame with lugs for the attaching screws, and bearings for the spindle, which is belt driven or by direct motor, fig. 1.

Protection against weather is frequently given by means of a hood, and against back draught when the fan is stopped by an automatic shutter; this has two light doors which close by gravity but fly open easily when the fan commences to run. The quantity of air moved in a given time depends on the speed, but the following table affords an idea of output with Sturtevant fans:—

Diameter of fan in inches	Revolutions per minute	Cubic ft. of air per minute, with "free" inlet and outlet
12	1,300	1,300
15	1,000	2,000
18	850	3,000
24	630	6,000
36	425	12,000
48	320	19,000
60	255	30,000

The blades in fig. 1 are of *open* sort, while another kind, the *box* blade, has the tips encircled by a binding ring, affording greater rigidity, and permitting of higher speeds. Very large propeller fans are built up to about 10 ft. diameter, one of this size giving 246,000 cubic ft. at 250 revolutions per minute, and consuming 42 h.p. The small pressures produced by fans are measured against a column of water in a *water-gauge*, and stated in inches and parts of the inch.

The centrifugal fan takes in air at the *eye* or side opening of the casing, and the numerous blades of the impeller seize it and throw it off tangentially from their tips.

FIG. 2.—THE CENTRIFUGAL FAN
This type is able to work against resistances which would render the propeller fan ineffective

The casing is built of such shape that its opening provides the tangential discharge, fig. 2, which may be arranged horizontally, or upwards, downwards or at an angle. Steel plate is employed to make the casing, but in the large-mine fans there is a good deal of masonry enclosure. Shapes of blades differ considerably; in some fans they are relatively few in number and of large area, in others numerous and narrow. The Sirocco fan made by Davidson & Co. Ltd. of Belfast in the eastern hemisphere and by the American Fan Blower Corporation in the western hemisphere led a practice in the latter direction, the wheel possessing a lot of

FIG. 3.—THE WHEEL OF SIROCCO CENTRIFUGAL FAN
The blades are numerous and narrow, and the centrifugal effect created within the wheel is very marked

narrow, long blades (fig. 3) with their outer edges curved forward in the direction of rotation. The eye or intake is of equal diameter to the wheel. When the fan runs, centrifugal force is created upon the body of air within the wheel. This causes a partial vacuum in the central space between the blades, to be immediately filled by air entering the inlet. As the air moves outwards over the blades its speed increases. The greater the wheel speed the higher the velocity. Double-inlet fans comprise two wheels on the same shaft, each drawing from the side; large duty can be obtained in this way in limited space. Many large fans are driven at each end of the shaft, the steam engine being in duplicate for this. The surface fans of mines are capable of being used either to exhaust air from the mine, or to blow fresh air down. This is done by means of an arrangement of doors and dampers in the fan. Fig. 4 illustrates the arrangement as applied to a steam-driven outfit by The Waddle Patent Fan and Engineering Co. Ltd., Llanelly (Wales). The door A closes the by-pass drift when the fan is exhausting. When it is required to blow fresh air down the upcast pit, A is swung on its hinges, thus shutting off the main drift from the fan inlet. Then door B is lifted to admit fresh air to the fan, and flap-doors C dropped shut, the fresh air being consequently dis-

charged along the by-pass drift (uncovered by door A) and along the main drift to the upcast shaft. The ordinary air-lock doors for getting into the fan drift are at D, and serve as an additional inlet for fresh air.

For supplying the blast to cupolas, forge fires, furnaces and other services requiring high pressures a narrow kind of fan is utilized, having the blast wheel enclosed in a cast-iron casing.

FIG. 4.—DIAGRAM OF THE WADDLE MINE FAN INSTALLATION SHOWING ARRANGEMENT OF DOORS BY WHICH THE FAN CAN BE USED EITHER FOR EXHAUSTING, OR FOR BLOWING FRESH AIR DOWN THE PIT

Another special construction is the dust fan wheel, which is built very strongly to withstand the impact of materials sucked in (such as chips and small pieces of wood from the machines) and the flow of air is such that the blades do not become choked with the material.

Applications of Fans.—Air supply for ventilating purposes is necessary in cases where natural ventilation does not suffice, not only for people but for the ventilation of various kinds of rooms carrying on processes, or cargo holds, engine-rooms, fig. 5, as well as individual machines, notably electric generators (*see COOLING SYSTEMS*). A big liner will have more than one hundred fans on board. For warming the air in heating systems steam or direct-fired heaters are installed, the former utilizing live or exhaust steam, the latter wood, coal, coke or oil fuel. Air-washers are also used in conjunction with fans when it is essential to avoid the carrying in of dirt into a building or amongst machines, or goods in process of manufacture; sprays of water break up the air and cause the dust and grit to fall by gravity into a tank. The cooling of the air is obviously beneficial, for certain purposes. Warm air for drying purposes is applied either in rooms, cabinets or tunnels in which the goods to be dried are placed. Substances include various foodstuffs, as bacon, tea, fruit, vegetables, grain, milk, sweetmeats and so on, also glass, starch, rubber, leather, paint, various paper goods, chemicals, and some things in course of manufacture, as tins and boxes.

Timber seasoning is effected by a fan sending warm air through the kilns; a certain degree of humidity has to be maintained, either by mixing steam with the air, or re-circulating part of the air which has already extracted moisture from the timber. Recording instruments have to be installed to take readings of temperature and humidity, so that control may be exercised.

In addition to the supply of air to forges, cupolas and furnaces, fans are also employed to create draught for steam-boiler furnaces, giving increased steaming power, and economy of fuel. Low-grade fuels can be burned satisfactorily, because of the extra volume of air forced through the fire, and there is incidentally reduction of smoke, while chimney height may be considerably less than for natural draught. Another type of pressure application is that of pneumatic elevating and conveying, transporting through tubing such light materials as sawdust, wool, bark, chaff, cotton, cork, etc., and carriers for messages, coins, etc.

Great value is obtained from fans in industries which create dust, grit, cuttings, fibres, steam and fumes, the extraction and

FIG. 5.—VENTILATION OF A SHIP'S ENGINE ROOM
Fans in duplicate suck fresh air down through cowls, and, heated air rises through the shafts

complete removal of these being effected through ducts. Many reasons may be mentioned why this is necessary, some having to do with the workers' health, others non-interference with the machines or processes by the waste products, and in many cases safety from fire or explosion. The general principle is that of placing a hood about the spot where the products come off, the fan suction whisking them away instantaneously. But for this some machines would be unworkable; some wood-working machines would bury themselves in their cuttings in a few minutes, brushing away being impracticable as well as dangerous. A big sheet-metal casing termed cyclone separator receives the refuse and in its conical body a whirling motion causes the refuse to fall to the bottom and thence to boilers to act as fuel. Refuse which reaches the floor of a factory is brushed along to a *sweep-up*, fig. 6 (Sturtevant), which sucks everything away similarly to the hoods on the machines. Industries requiring dust removal plants include principally wood-working, metal-grinding, polishing, cleaning by tumbling barrel, sand-blasting, leather and textile processes, brush factories, paint works, paper mills, potteries, linoleum works, granaries, cement works, collieries and quarries. Prevention of atmospheric pollution is another field for the fan collection system, dust particles which are carried up the chimney in power plants, especially when cheap and small fuels are burned. The dust nuisance has often compelled power stations to buy more expensive fuel on this account. An extreme case is quoted at a Scotch colliery, where coal-dust and slack is fed to the boilers, being a fine and dirty mixture. When a Davidson collector was installed no less than 450 lb. of dust per hour were trapped, from two boilers, using 5,500 lb. of fuel per hour.

FIG. 6.—STURTEVANT "SWEEP-UP"
Set in the floor of a factory and connected to a fan, this device sucks away shavings, sawdust and bits of wood brushed to the opening

(F.H.)

FANSHAWE, SIR RICHARD, BART., cr. 1650 (1608-1666), English poet and ambassador, translator of Camoens, son of Sir Henry Fanshawe, remembrancer of the exchequer, of Ware park, Hertfordshire, and of Elizabeth, daughter of Thomas Smith or Smythe, was educated in Cripplegate by the famous schoolmaster, Thomas Farnaby, and at Jesus college, Cambridge. In 1635 he was appointed secretary to the English embassy at Madrid under Lord Aston. At the outbreak of the Civil War he joined the king. He was appointed secretary for war to the prince of Wales, with whom he set out in 1645 for the western counties, Scilly, and afterwards Jersey. He compounded in 1646 with the parliamentary authorities, and was allowed to live in London till Oct. 1647. In 1647 he published his translation of the *Pastor Fido* of Guarini (*q.v.*) which he reissued in 1648 with the addition of several other poems, original and translated. In 1648 he was appointed treasurer to the navy under Prince Rupert. In November of that year he was in Ireland, where he actively engaged in the Royalist cause till the spring of 1650, when he was despatched by Charles II. on a mission to obtain help from Spain. This was refused, and he joined Charles in Scotland as secretary. He was taken prisoner at the battle of Worcester. After a brief confinement he was allowed to choose his own place of residence. His works include: *Selected Parts of Horace* (1652), *Querer por solo querer: To Love only for Love's Sake* (pr. 1670) and *Fiestas de Aranjuez* (pr. 1671) from the Spanish of Antonio de Mendoza. But the great labour of his retirement was the translation (1655) of the *Lusiad*, by Camoens. It is in ottava rima, with the translation prefixed to it of the Latin poem *Furor Petroniensis*. In 1658 he published a Latin version of the *Faithful Shepherdess* of Fletcher.

In April 1659 Fanshawe re-entered Charles's service in Paris. After the Restoration he was engaged in diplomatic missions in Spain and Portugal. He died at Madrid, on June 26, 1666. He had a family of 14 children, of whom five only survived him, Richard, the youngest, succeeding as second baronet and dying unmarried in 1694.

Fanshawe's translations of *Pastor Fido* and his *Lusiad* have

not been superseded by later scholars, and his own poems are of real merit.

BIBLIOGRAPHY.—*Memoirs of Lady Fanshawe* (née Anne Harrison), written in 1676 and published in 1829 (from an inaccurate transcript); these were reprinted from the original manuscript and edited by H. C. Fanshawe (1907); article in the *Dict. of Nat. Biography* and authorities there quoted; J. W. Mackail, "Sir Richard Fanshawe" in *Trans. Roy. Soc.* vol. 28. *Add. mss. British Museum*, 15,228 (poems); *Harl. mss. Brit. Mus.* 7,010 (letters).

FANTAN, a form of gambling highly popular among the Chinese and extensively played in the United States. It is a very simple game. A square is marked in the centre of an ordinary table, or a square piece of metal is laid on it, the sides being marked 1, 2, 3 and 4. The banker puts on the table a double handful of small coins—in China "cash"—or similar articles, which he covers with a metal bowl. The players bet on the numbers, setting their stakes on the side of the square which bears the number selected. When all have staked, the bowl is removed, and the banker or croupier with a small stick removes coins from the heap, four at a time, till the final batch is reached. If it contains four coins, the backer of No. 4 wins; if three, the backer of No. 3 wins, and so on. Twenty-five per cent is deducted from the stake by the banker, and the winner receives five times the amount of his stake thus reduced. In Macao, the Monte Carlo of China, play goes on day and night, every day of the week, and bets can be made from 5 cents to 500 dollars, which are the limits.

Fantan is also the name of a card game, played with an ordinary pack, by any number of players up to eight. The deal decided, the cards are dealt singly, any that are left over forming a stock, and being placed face downwards on the table. Each player contributes a fixed stake or "ante." The first player can enter if he has an ace; if not he pays an "ante" and takes a card from the stock; the second player is then called upon and acts similarly till an ace is played. This (and the other aces when played) is put face upwards on the table, and the piles are built up from the ace to the king. The pool goes to the player who first gets rid of all his cards. If a player fails to play, having a playable card, he is fined the amount of the ante for every card in the other players' hands.

FANTASIA, a name in music for a composition possessing little structural form, and having the general style of an improvisation; also for a combination or medley of familiar airs connected together with original passages of more or less brilliance. The word, however, was originally applied to more formal compositions, based on the madrigal, for several instruments. Fantasias appear as compositions of a distinctive type in Bach's works, in the case of which they frequently serve as preludes to fugues, e.g., the "Chromatic Fantasia and Fugue." Brahms used the term for some of his shorter piano pieces, and it has also been applied on occasion to much larger and more elaborately organized works, alike for the piano and for the orchestra, such as Schubert's "Wanderer" fantasia, Schumann's Op. 17 and Tchaikovsky's symphonic fantasia *Francesca da Rimini*.

The Italian word is still used in Tunis, Algeria and Morocco with the meaning of "showing off" for an acrobatic exhibition of horsemanship by the Arabs.

FANTI, MANFREDO (1806–1865), Italian general, was born at Carpi on Feb. 24, 1806, and educated at the military college of Modena. In 1831 he was implicated in the revolutionary movement organized by Ciro Menotti (see FRANCIS IV., of Modena), and was condemned to death and hanged in effigy, but escaped to France, where he was given an appointment in the French corps of engineers. In 1833 he took part in Mazzini's abortive attempt to invade Savoy, and in 1835 he went to Spain to serve in Queen Christina's army against the Carlists. There he remained for thirteen years, rising to a high staff appointment. But on the outbreak of the war between Piedmont and Austria in 1848 he hurried back to Italy, and although at first his services were rejected both by the Piedmontese government and the Lombard provisional government, he was afterwards given the command of a Lombard brigade. In the general confusion following on Charles Albert's defeat on the Mincio and his retreat to Milan,

where the people rose against the unhappy king, Fanti's courage and tact saved the situation. He was elected member of the Piedmontese chamber in 1849, and on the renewal of the campaign he again commanded a Lombard brigade under General Ramorino. After the Piedmontese defeat at Novara (March 23) peace was made, but a rising broke out at Genoa, and Fanti with great difficulty restrained his Lombards from taking part in it. But he was suspected as a Mazzinian and a soldier of fortune by the higher Piedmontese officers. He was court-martialled, and, though acquitted, he was not employed again until the Crimean expedition of 1855. In the second Austrian war in 1859 Fanti commanded the second division, and contributed to the victories of Palestro, Magenta and San Martino. After the peace of Villafranca he converted the army of the Central Italian League (composed of the provisional governments of Tuscany, Modena, Parma and Romagna), into a well-drilled body of 45,000 men. He steered a clear course between the exaggerated prudence of Baron Ricasoli, who wished to recall the troops from the frontier, and the impetuosity of Garibaldi, his second-in-command, who was anxious to invade Romagna prematurely, even at the risk of Austrian intervention. Fanti's firmness led to Garibaldi's resignation. In Jan. 1860 Fanti became minister of war and marine under Cavour, and incorporated the League's army in that of Piedmont. In the meanwhile Garibaldi had invaded Sicily with his Thousand, and the king of Sardinia, Victor Emmanuel, decided at last that he too must intervene; Fanti was given the chief command of a strong Italian force which invaded the papal states, seized Ancona and other fortresses, and defeated the papal army at Castelfidardo, where the enemy's commander, General Lamoricière, was captured. In three weeks Fanti had conquered the Marche and Umbria and taken 28,000 prisoners. When the army entered Neapolitan territory the king took the chief command, with Fanti as chief of the staff. After defeating a large Neapolitan force at Mola and organizing the siege operations round Gaeta, Fanti returned to the war office at Turin to carry out important army reforms. His attitude in opposing the admission of Garibaldi's 7,000 officers into the regular army with their own grades made him unpopular, and led to a severe reprimand from Cavour. In 1861 he resigned office and took command of the VII. army corps. He died in Florence on April 5, 1865. His loss was greatly felt in the war of 1866.

See A. Di Giorgio, *Il Generale M. Fanti* (Florence, 1906).

(L. V.; X.)

FANTI, a Gold Coast people living on the Cape Coast—Elmina-Secondi littoral and hinterland, and speaking a language closely related to Ashanti (*q.v.*). They have an organization similar to that of the Ashanti, and though less warlike in temperament, probably derive from the same stock.

See Sarbah, *Fanti Customary Law* (1904).

FANTIN-LATOUR, IGNACE HENRI JEAN THÉODORE (1836–1904), French artist, was born at Grenoble on Jan. 14, 1836. He studied first with his father, a pastel painter, and then at the drawing school of Lecoq de Boisbaudran. He was the friend of Ingres, Delacroix, Corot, Courbet and others. He exhibited in the Salon of 1861 and many of his more important canvases appeared on its walls in later years, though 1863 found him with Harpignies, Manet, Legros and Whistler in the Salon des Refusés. Whistler introduced him to English artistic circles in London. He died on Aug. 28, 1904. His portrait groups, arranged somewhat after the manner of the Dutch masters, are as interesting from their subjects as they are from the artistic point of view. "*Hommage à Delacroix*" showed portraits of Whistler and Legros, Baudelaire, Champfleury and himself; "*Un Atelier à Batignolles*" gave portraits of Monet, Manet, Zola and Renoir, and is now in the Luxembourg; "*Un Coin de table*" presented Verlaine, Rimbaud, Camille Peladan and others; and "*Autour du Piano*" contained portraits of Chabrier, D'Indy and other musicians. His paintings of flowers are perfect examples of the art. In his later years he devoted much attention to lithography. After "*L'Anniversaire*" in honour of Berlioz in the Salon of 1876, he regularly exhibited lithographs, some of which were examples of delicate portraiture, others being elusive and imaginative drawings illustrative of the music of Wagner (whose cause he cham-

pioned in Paris as early as 1864), Berlioz, Brahms and other composers. He illustrated Adolphe Jullien's *Wagner* (1886) and *Berlioz* (1888). There are excellent collections of his lithographic work at Dresden, the British Museum and the Louvre.

See Germain Hédiard, *Les Maîtres de la lithographie* (1892-99); Loys Delteil, *L'Oeuvre lithographique de Fantin-Latour* (1907); A. Jullien, *Fantin-Latour, sa vie et ses amitiés* (1909).

FANUM FORTUNAE (mod. *Fano*), an ancient town of Umbria, Italy, at the point where the Via Flaminia reaches the north-east coast of Italy. As its name (the temple of Fortune) shows it was of Roman origin. It is first mentioned, with Pistorium and Ancona, as held by Julius Caesar in 49 B.C. Augustus planted a colony there, and round it constructed a wall (of which some remains exist), as is recorded in the inscription on the triple arch erected in his honour at the entrance to the town (A.D. 9-10), which is still standing. Vitruvius tells us that there was, during Augustus's lifetime, a temple in his honour and a temple of Jupiter, and describes a basilica of which he himself was the architect. The arch of Augustus bears a subsequent inscription in honour of Constantine, added after his death. A colonnade was built above the arch but was removed in 1463 (shown in a relief on the façade of the church of S. Michele).

FAN VAULT, in architecture, a type of English late Gothic vaulting, in which many equidistant non-structural, decorative ribs of similar curvature rise from each support in a generally conoidal form. These conoids either intersect at the ridges or leave small, flat areas between the circles which are their top and outside circumferences. The entire surfaces thus formed are usually covered with a network of tracery. The earliest example is in the cloisters of Gloucester cathedral (1351-1412). Other notable examples are that at King's college chapel, Cambridge (c. 1512), and that of the chapel of Henry VII., Westminster Abbey, of about the same date, notable for the fact that the conoids are supported on pendants from great cross arches and not directly on the piers. (See VAULT; GOTHIC ARCHITECTURE.)

FĀRĀBĪ or **ALFARABĪ** (Abū Naṣr Muḥammad ibn Tarkhān ul-Fārābī) (c. 870-950), Arabian philosopher, was born of Turkish stock at Fārāb, Turkistan. At Baghdad, he learned Arabic and studied mathematics, medicine and philosophy. Later he went to the court of the Ḥamdānīd Saif addaula, where he lived a quiet life. He died in Damascus.

Alfarabi's philosophy, which greatly influenced Avicenna and Averroes, is coloured by Neoplatonism. God, the unmoved mover possessing necessary existence and absolute perfection, produces the world by the intermediary of the active intellect. As far as man is concerned this active intellect is the final form and the only immortal part. Alfarabi's epistemology is a naïve realism. By his commentaries and interpretations especially on the *Organon*, *Nich. Ethics*, and the *Physics*, Alfarabi introduced Aristotle to the Arabs. His *De Scientiis* and *De Intellectu* appeared in *Alpharabii Opera Omnia* (Paris, 1638). Dieterici has published *Alfarabi's philosophische Abhandlungen* (Leyden, 1890, Ger. trans. 1892), *Alfarabi's Abhandlung des Musterstaats* (1895, Ger. trans. 1900) and *Die Staatsleitung von Alfarabi* in German (1904). C. Baumker has edited *De ortu scientiarum* (1919), and M. Horten has translated and explained *The Book of Gems* with the commentary of Ismā'īl (1906).

See Steinschneider's article in *Mémoires de l'Académie* (St. Petersburg [Leningrad], 1869); Brockelmann, *Gesch. der arab. Literatur*, vol. i. (Weimar, 1898); Duhem, *Le Système du Monde*, t. 4 (1916).

FARAD. A unit of electric capacity. The capacity of a conductor or condenser is one farad when a quantity of electricity, equal to one coulomb increases its potential by one volt. (See ELECTRICITY and CONDENSER.)

FARADAY, MICHAEL (1791-1867), English chemist and physicist, was born at Newington, Surrey, on Sept. 22, 1791. His parents had migrated from Yorkshire to London, where his father worked as a blacksmith. Faraday himself was apprenticed to a bookbinder. He continued to work as a journeyman bookbinder till March 1813, when he was appointed assistant in the laboratory of the Royal Institution of Great Britain on the recommendation of Sir Humphry Davy, whom he accompanied

on a tour through France, Italy and Switzerland from Oct. 1813 to April 1815. He was appointed director of the laboratory in 1825; and in 1833 he was appointed Fullerian professor of chemistry in the institution for life, without the obligation to deliver lectures. He died at Hampton Court on Aug. 25, 1867.

The parents of Faraday belonged to the very small and isolated Christian sect which is commonly called after Robert Sandeman. Faraday himself attended the meetings from childhood; and at the age of 30 he made public profession of his faith.

Faraday's earliest chemical work was in the paths opened by Davy, to whom he acted as assistant. He made a special study of chlorine, and discovered two new chlorides of carbon. He also made the first rough experiments on the diffusion of gases, a phenomenon first pointed out by John Dalton (*q.v.*). He succeeded in liquefying several gases; he investigated the alloys of steel, and produced several new kinds of optical glass. A specimen of one of these heavy glasses afterwards became historically important as the substance in which Faraday detected the rotation of the plane of polarization of light when the glass was placed in a magnetic field, and also as the substance which was first repelled by the poles of the magnet. He also improved laboratory methods. See his work on *Chemical Manipulation*, and the articles LIQUEFACTION OF GASES.

FIRST PERIOD OF ELECTRICAL DISCOVERIES

But Faraday's chemical work was soon overshadowed by his electrical discoveries. The first experiment which he has recorded was the construction of a voltaic pile with seven halfpence, seven disks of sheet zinc, and six pieces of paper moistened with salt water. With this pile he decomposed magnesium sulphate (first letter to Abbott, July 12, 1812). His first notable discovery was the production of the continuous rotation of magnets and of wires conducting the electric current round each other. The consequences deducible from the great discovery of H. C. Oersted (July 21, 1820) were still imperfectly understood. In the summer of 1821 Faraday wrote for the *Annals of Philosophy* an historical sketch of electro-magnetism, and he repeated the experiments he described. This led him in the beginning of September to discover the method of producing the continuous rotation of the wire round the magnet, and of the magnet round the wire. He did not succeed in making the wire or the magnet revolve on its own axis.

Although the fact of the tangential force between an electric current and a magnetic pole was clearly stated by Oersted, and clearly apprehended by Ampère, Wollaston and others, the realization of the continuous rotation of the wire and the magnet round each other was a scientific puzzle requiring no mean ingenuity for its original solution. For on the one hand the electric current always forms a closed circuit, and on the other the two poles of the magnet have equal but opposite properties, and are inseparably connected, so that whatever tendency there is for one pole to circulate round the current in one direction is opposed by the equal tendency of the other pole to go round the other way, and thus the one pole can neither drag the other round and round the wire nor leave it behind. Faraday solved the problem by causing the current, in some part of its course, to run in parallel in two channels, one on each side of the magnet, in such a way that during the revolution of the magnet the current is transferred from the channel in front of the magnet to the channel behind it, so that the middle of the magnet can pass across the current without stopping it, just as Cyrus caused his army to pass dryshod over the Gyndes by diverting the river into a channel cut for it in his rear.

Faraday's crowning discovery was the induction of electric currents. In Dec. 1824 he had attempted to obtain an electric current by means of a magnet, and on three occasions he had attempted to produce a current in one wire by means of a current in another wire or by a magnet. On Aug. 29, 1831, he obtained the first evidence that an electric current can induce another in a different circuit. In nine more days of experimenting he had arrived at the results described in his first series of "Experimental Researches" read to the Royal Society on Nov. 24, 1841.

During his first period of discovery, besides the induction of electric currents, Faraday established the identity of electrifi-

cation produced in different ways; the law of the definite electrolytic action of a current; and the fact, upon which he laid great stress, that every unit of positive electrification is related in a definite manner to a unit of negative electrification, so that it is impossible to produce what Faraday called "an absolute charge of electricity" of one kind not related to an equal charge of the opposite kind. He also discovered the difference of the capacities of different substances for taking part in electric induction. Henry Cavendish had before 1773 discovered that glass, wax, rosin and shellac have higher specific inductive capacities than air, and had actually determined the numerical ratios of these capacities, but this was unknown both to Faraday and to all other electricians of his time, since Cavendish's *Electrical Researches* remained unpublished till 1879.

SECOND PERIOD OF ELECTRICAL DISCOVERIES

The first period of Faraday's electrical discoveries lasted ten years. In 1841 he found that he required rest, and it was not till 1845 that he entered on his second great period of research, in which he discovered the effect of magnetism on polarized light, and the phenomena of diamagnetism.

Faraday had for a long time kept in view the possibility of using a ray of polarized light as a means of investigating the condition of transparent bodies when acted on by electric and magnetic forces. He began to work on this problem in 1822, and returned to it repeatedly during the next 13 years. The first evidence which he obtained of the rotation of the plane of polarization of light under the action of magnetism was in 1845, the transparent substance being his own heavy glass. He began to work on Aug. 30, 1845, on polarized light passing through electrolytes. After three days he worked with common electricity, trying glass, heavy optical glass, quartz, Iceland spar, all without effect, as on former trials. On Sept. 13 he worked with lines of magnetic force. Air, flint, glass, rock-crystal, calcareous spar were examined, but without effect.

Heavy glass was experimented with. It gave no effects when the same magnetic poles or the contrary poles were on opposite sides (as respects the course of the polarized ray), nor when the same poles were on the same side either with the constant or intermitting current. But when contrary magnetic poles were on the same side there was an effect produced on the polarized ray, and thus magnetic force and light were proved to have relations to each other. This fact will most likely prove exceedingly fertile, and of great value in the investigation of the conditions of natural force.

On Nov. 6 he sent in to the Royal Society the 19th series of his "Experimental Researches," in which the whole conditions of the phenomena are fully specified. The negative rotation in ferromagnetic media is the only fact of importance which remained to be discovered afterwards (by M. E. Verdet in 1856).

But his work for the year was not yet over. On Nov. 3 a new horseshoe magnet came home, and Faraday immediately began to experiment on the action in the polarized ray through gases, but with no effect. The following day he repeated an experiment which had given no result on Oct. 6. A bar of heavy glass was suspended by silk between the poles of the new magnet. "When it was arranged, and had come to rest, I found I *could* affect it by the magnetic forces and give it position." By Dec. 6 he had sent in to the Royal Society the 20th, and on Dec. 24 the 21st series of his "Researches," in which the properties of diamagnetic bodies are fully described. Thus these two great discoveries were elaborated, like his earlier one, in about three months. The discovery of the magnetic rotation of the plane of polarized light, though it did not lead to such important practical applications as some of Faraday's earlier discoveries, has been of the highest value to science, as furnishing complete dynamical evidence that wherever magnetic force exists there is matter, portions of which are rotating about axes parallel to the direction of that force.

(See ELECTRICITY: *Historical Introduction* and MAGNETISM.)

His published works were *Chemical Manipulation, being Instructions to Students in Chemistry* (1st ed. 1827, 2nd 1830, 3rd 1842); *Experimental Researches in Electricity*, vols. i. and ii.

(1844 and 1847); vol. iii. (1844); vol. iii. Richard Taylor and William Francis (1855); *Experimental Researches in Chemistry and Physics* (1859); *Lectures on the Chemical History of a Candle* (edit. by W. Crookes, 1861); *On the Various Forces in Nature* (edit. by W. Crookes, no date).

See J. Tyndall, *Faraday as a Discoverer* (1st ed. 1868, 2nd ed. 1870); Bence Jones, *The Life and Letters of Faraday* (2 vols., 1870); J. H. Gladstone, *Michael Faraday* (1872); S. P. Thompson, *Michael Faraday; his Life and Work* (1898). (J. C. MA.; X.)

FARAH, a town of Afghanistan, on the river that bears its name on the main road between Herat and Kandahar, 160 m. S. of Herat and 225 m. W. of Kandahar. It commands the approaches to India and Seistan from Herat. The town (2,460 ft. above sea-level) is a square walled enclosure in the middle of the plain. Owing to its unhealthiness it is only occupied by the Afghan regiment quartered there. It is probably the Phra mentioned by Isidore of Charax in the 1st century A.D.

FARAH, a river of Afghanistan. It rises in the southern slopes of Siah-Koh, which forms the southern wall of the valley of Herat, and after a south-westerly course of about 200 m. falls into the Seistan Hamun. At the town of Farah it has a width of 150 yd. in the dry season with 2 ft. of water and a clear, swift stream. It is liable to floods, when it becomes impassable for weeks. The lower valley of the Farah Rud is fertile and well cultivated.

FARAZDAQ (Hammām ibn Ghālib ibn Sa'sa', known as al-Farazdaq) (c. 641–c. 728), Arabian poet, was born at Basra. At the age of fifteen Farazdaq was known as a poet. He devoted his talent largely to satire and attacked the bani Nahshal and the bani Fuqaim. When Ziyād, a member of the latter tribe, became governor of Basra, the poet fled, first to Kufa, and then, as he was still too near Ziyād, to Medina, where he was well received by Sa'īd ibn ul-Āsi. Here he remained about ten years, writing satires on Bedouin tribes, but avoiding city politics. But he lived a prodigal life, and his amorous verses led to his expulsion by the caliph Merwan I. On the death of Ziyād he returned to Basra, where he secured the favour of Ziyād's successor 'Obaidallāh ibn Ziyād. Much of his verse at this period is concerned with his dispute with his wife, his cousin Nawār, whom he had married against her will. Another subject occasioned a long series of verses, namely his feud with his rival Jarīr (*q.v.*) and his tribe the bani Kulāib. These poems are published as the *Naka'id of Jarīr and al-Farazdaq* (ed. A. A. Bevan, Leiden, 1906 ff.). In political life Farazdaq was prevented by fear from taking a large part. He seems, however, to have been attached to the house of 'Alī. During the reign of Moawiya I. he avoided politics, but later gave his allegiance to 'Abdallāh ibn Zohair.

The fullest account of his life is contained in J. Hell's *Das Leben Farazdaq nach seinen Gedichten* (Leipzig, 1903); Arabian stories of him in the *Kitāb ul-Aghāni* and in Ibn Khallikān. A portion of his poems was edited with French translation by R. Boucher (Paris, 1870); the remainder have been published by J. Hell (Munich, 1900).

FARCE, a form of comedy in dramatic art, the object of which is to excite laughter by ridiculous situations and incidents. It originated from the Latin *farciare*, to stuff, and with the meaning of "stuffing" or forcemeat it appears in old cookery books in English. The French *farce*, the form to which we owe our word, was originally the "gag" that the actors in the mediaeval drama inserted into their parts, generally to meet the popular demand for a lightening of humour or buffoonery. It has thus been used for the lighter form of comic drama (see DRAMA), and also figuratively for a piece of idle buffoonery, sham or mockery.

FAR EASTERN AREA, an administrative unit of Asiatic Russia, created in 1922, upon the fall of the independent Far Eastern People's Republic: it occupies 2,846,323 sq.km., but its population in 1926 was only about 1,843,000. Eastward from Chaum bay the Arctic ocean forms its northern boundary, and the Bering sea, the Okhotsk sea and the Gulf of Tartary wash its eastern shores. The Yakutsk and Buriat-Mongol Soviet Republics lie to the west, the boundary running for the most part along the crests of the Anadyr, Stanovoi and Yablonoi mountains. Mongolia, Manchuria and Korea lie to the south; the Peking Convention of 1860 defined the boundary between Russia and

Manchuria as following the Argun, Amur, Ussuri and Sungacha rivers to Lake Khanka, thence crossing the lake westwards to the Pai-ling river, thence along a mountain range to the junction of the Hu-pu-tu (Khutbu) with the Suifen river, and thence along the Hunchun river, and along the range of mountains between that river and the sea, up to the Tumen river 6 m. inland from its mouth. However, most maps show the boundary as running along the whole course of the Hu-pu-tu river. The ocean boundary lies along the Bering strait, separating Russia from Alaska and Lawrence island, and passes south of Cape Lopatka separating the Kurile isles from Kamchatka. The Commander islands, off the east of Kamchatka peninsula, and the part of Sakhalin island north of lat. 50°, form part of the Far Eastern Area. A commission is at present (1928) considering the following alterations of the boundary between the Yakutsk Republic and the Far Eastern Area (1) the provision of an outlet to the sea for the Yakutsk Republic through Ayan, a port on the sea of Okhotsk; (2) the creation of an autonomous Tungus area, formed partly from the south-eastern Yakutsk Republic and partly from the Uda river territory of the Far Eastern Area, with Chumukan as its administrative centre; (3) the union of the Aldan-Amur goldfield under one administration; (4) the union of the Kolyma river district with the Okhotsk river district. It should be noted that an isolated portion of the Trans-Baikal province belongs to the Buriat Mongol Republic (*q.v.*). Much of the area is unproductive, and difficulties of position, structure and climate combine to retard its development. A great part of Kamchatka has not yet been topographically or geologically surveyed, and uncertainty exists as to the continuity of the Yablonoi and Stanovoi mountains, and as to the north-eastern termination of the latter. The relation of the Great Khingan to the Stanovoi is also not yet worked out. Much of Kamchatka, both peninsular and continental, is occupied by mountains, and in the Amur province a range of granitic and schistose mountains, called the Little Khingan, or Bureya or Dousse Alin, runs parallel to the Great Khingan from the north bank of the Amur river, while still further east is the Sikhota Alin range, occupying most of the Maritime Province. The only volcanic activity is in Kamchatka peninsula, where a series of partly active and partly extinct volcanoes runs along the east coast. Kluchevskaya, 16,130 ft., is probably the highest active volcano in Asia. The Trans-Baikal region, with the Selenga, Vitim and Aldan plateaux, forms part of a terrace rising 3,000 to 5,000 ft. above the general 1,200 to 1,500 ft. level of the high eastern plateau of Asia. Tundra occupies one-third of the Far Eastern Area, and in addition part of north Sakhalin is tundra. If these tundra regions are excluded, 64% of the remaining land is forest clad. The forests may be divided roughly into three groups, (1) the Daurian type stretching from the west of Transbaikalia to the Zeya river, consisting mainly of larch and birch, with open prairies which in spring become grassy seas, where the peony, aconite and similar blooms reach a height of 4 to 5 ft.; (2) the Manchurian type, extending eastward from the Bureya river and southward along the western slopes of the Sikhota Alin range. The prevailing trees are fir, silver fir and Manchurian cedar, amongst which are sprinkled broad-leaved Manchurian varieties, *e.g.*, velvet tree, Greek nut, Manchurian ash, Mongolian oak and a few species of maple; (3) the Okhotsk-Kamchatka flora occupying Okhotsk and Kamchatka, the eastern slopes of the Sikhota Alin, the northern parts of the Amur and Maritime provinces and the island of Sakhalin. It consists mainly of the Siberian fir and cedar, with a few birch, aspen, alder and poplar trees. In spite of this wealth, the timber industry is little developed, partly because of the lack of road communication and sea tonnage and partly because of the lack of suitable port facilities; the capital to provide these is lacking. The Amur river forms an excellent summer waterway for timber, but Nikolaevsk at its mouth has no facilities for timber haulage and embarkation. The river is frozen from November to May and at Nikolaevsk to June. At present, therefore, Vladivostok is the main timber port, but the fact that timber must be carried by rail to it increases the cost and hence puts Russian timber at a disadvantage on the world market.

Vladivostok also is the natural outlet for Manchurian timber, and with better dock facilities could double its trade. Oak, cedar, fir and planks of aspen for match manufacture are chiefly exported, while Imperatorskaya bay (now Soviet bay) exports soft woods to Australia, and Olga bay exports pit props. Attempts are being made to replace the export of raw timber by local industries dependent on timber, and match, veneer and plywood factories have been established in the Ussuri valley, while in Transbaikalia, the Amur province and Primorsk there are now more than 30 timber mills, those round Vladivostok manufacturing barrels for the fishing industry. At Spasskaya (Yevgenevka) on the Ussuri railway, is a factory producing turpentine, tar, wood alcohol, vinegar, resin and potash.

In spite of destructive exploitation in the past, hunting and trapping still form the chief occupation of the native tribes, and a supplementary source of income for the Russian settlers. The Arctic fox and white bear are found only north of lat. 60°, and the former is not so abundant as in western Siberia. The blue, the red and the black or silver fox are trapped in quantity, especially by the Koryaks. The raccoon dog, a native of China and Japan, is found in the Amur basin and valued for its skin in winter and its flesh in summer. The polar bear is found where there are seals, but the brown or Kamchatkan bear is common in the forests and yields both fur and food; the black or Tibetan bear is found in the south. The Gilyak tribes are specially skilled in bear hunting, and the bear has religious significance for many native tribes. The marten and sable are decreasing; the best sable comes from the Nerchinsk, Amgun and Zeya districts and the poorest quality from Sakhalin. Ermine, glutton, skunk and otter are also decreasing. The hare is trapped for local use, though many tribes will not eat its flesh. Squirrels are not found in Kamchatka, but in the south they are common, and their skin is in great demand for gloves, hoods and carriage aprons. The reindeer is widespread in the tundra region, the Koryaks and Chukchee often owning herds of two to five thousand head, which provide them with meat, leather and means of locomotion. War conditions of 1914-22 had a disastrous effect, and it has been calculated that of 1,622,000 reindeer, only 687,000 survived. The elk is also found, and the wapiti and maral deer are valued for their horns. From the horns of the maral deer a powder called *panty* is obtained which is in great request amongst Chinese physicians. The musk deer is hunted in the Amur region and Sakhalin; its flesh is eaten, its skin used for clothing and its thin leg bones made into arrowheads. The roebuck, stag, rock-deer and spotted deer are found, and in the island of Askold near Vladivostok, the siku. The musk ox is extinct, except possibly in Sakhalin.

The Commander islands were at one time famous for the fur seal, but promiscuous killing has greatly diminished its numbers. Near Chita and in the jungles of the Primorsk area, tigers are much dreaded; the snow leopard, lynx and two varieties of wild cat are also found. Fish is abundant and varied, both in the rivers and the sea; many native tribes rely on fish for food in much the same way as we rely on bread. It is salted or frozen for winter use, and towards the end of winter is often eaten in an advanced state of decomposition. The best market for exported fish is Japan. Attempts are being made to foster a tinned fish industry, and Kamchatkan tinned salmon, mainly put up under Japanese direction, finds an increasing market. The scarcity of salt greatly hampers the fish preserving industry, and the government is (1928) financing the Yakutsk salt mines on Vilyui river, a tributary of the Lena, to meet the need. Herrings are abundant in Peter the Great gulf and could find a ready market in Siberia if better transport and refrigerator facilities were provided. The Keta or dog-salmon is common except in south Kamchatka, and from its skin the natives make sails, clothes and boots. For a detailed account of the numerous kinds of fish see *A Handbook of Siberia and Arctic Russia*, I.D. 1207. London 1920, in which there is also a detailed account of the various native tribes.

Climate.—The climate varies much, since the region extends from 70° N. to 42° N. The north-east corner, including the

Anadyr mountains, lies within the frozen Arctic tundra zone, where summer is very short, with a temperature never rising above 60° F, and winter is long and cold, with a January mean of -10° F to -40° F. Precipitation is slight. Three factors influence the climate of the remaining area, (1) the cold current of the Okhotsk sea considerably lowers the temperature; thus the centre of the frozen Kamchatka desert lies in about the same latitude as Moscow; (2) the south-east monsoon brings rain, especially in July and August, to all the Pacific coastal areas, thus making summer stormy, wet and cool and unfavourable to agriculture; (3) the continental situation and high elevation of Transbaikalia and part of the Amur province cause severe winters, often lasting seven months, though in the remaining five summer months the heat is sufficient to allow sub-tropical plants, e.g., rice, to be grown. The slight snowfall exposes the ground to the severe winter frosts and prevents the cultivation of winter wheat. The range of temperature here may be 70° F, and even at Vladivostok is 64.6° F. The annual rainfall in Transbaikal and the west of the Amur province is 300 to 500 mm.; in the eastern Amur and the Maritime area 500 to 700 mm. and towards the south 700 mm. Dense fogs are common on the coast in summer. Sakhalin and Kamchatka have less severe extremes of climate and heavier rainfall all the year round; in east Kamchatka precipitation is about 1,000 mm. per annum. Ayan, on the south coast of the Okhotsk sea, gets the same heavy rainfall, but the north coast of this sea is completely dry.

Agriculture and Industry.—Rumours of rich black earths in the southern parts attracted the first settlers, but black earth exists only in the Transbaikal, where it is of poor quality and rapidly degenerates; climatic conditions here are unfavourable for agriculture. The soils in the Amur and Maritime provinces, formerly accepted as black earths, prove to be dark coloured bog, semi-bog and ash coloured soils; when capital for draining them becomes available, they should prove productive. On the narrow coastal fringe, the impenetrable clayey and stony rocks led to bogging and flooding during the semi-tropical summer rains. Agriculture is therefore most favourably carried on in the light, easily worked, muddy alluvial soils of the Amur, Ussuri, Zeya and Bureya valleys. The most densely sown area is round Blagovyeschensk, from which district sown land thins out in every direction; the chief crops are wheat 52.2%, oats 39.3%, grasses 2.2%, potatoes 1.4%, rye 1.3%, other crops being buckwheat, millet, sunflower seed, barley, flax and hemp. Melons are also grown. The Ussuri valley and the district near Vladivostok, especially from Lake Khanka to the Suifen river are well cultivated. Of late years rice has been introduced so successfully that its northern limit is now 49° N., instead of 42° N. Experiments are being carried out with a view to establishing the cultivation of tobacco, sugar-beet and silk; the chief crops at present are oats, wheat and buckwheat. Soya beans are increasingly grown and carrots, potatoes, tomatoes, cabbages and fruits, especially the apple, ripen well in the short summer. Hay in this district is so rank and coarse that cattle sometimes refuse it. Wild grapes are found in the southern Ussuri district. Beekeeping, since its introduction in 1871, forms a valuable supplement to agriculture, except where the opium poppy is grown. The only other cultivated region is in Transbaikal, along the valleys of the Ingoda, Onon and Argun rivers, where irrigation of a primitive kind is practised, rye, oats, wheat and buckwheat forming 92.4% of the harvest. The northern limit of agriculture in the Maritime province is 43° N., as against 65° N. in the Yakutsk Republic, but a small patch of land near the Tym and Poronaya rivers in Sakhalin, another near the mouth of the Uda river, and a third in the Kamchatka peninsula form tiny islands of possible cultivation much to the north of the general limit. War and civil war diminished the size of the sown area, and the quality of the harvest, which is still (1928) much below the 1913 level. Even then, however, sufficient grain for the needs of the population was not grown. Most imported grain is floated down the Sungari river from Manchuria; the remainder either comes from North America via Vladivostok or from western Russia via the Siberian railway. The home meat supply is also deficient, and fat cattle

from Mongolia form a staple import. Dairying and cattle breeding of a fairly intensive type are carried on in the Ussuri district to supply the towns of Khabarovsk and Vladivostok, but are much hampered by insect pests. In Transbaikal an extensive nomad form of cattle-breeding is carried on, the herdsman often taking their flocks into Manchuria for the winter. Horses are bred and used as working animals in the summer and for posting routes in the winter. The rearing of sheep and goats wherever possible was emphasized by war conditions, which cut off the supply of imported cloth and made the country dependent on homespun. Strong and hardy camels are bred in Transbaikal. Pigs in this region are of poor quality, but in the Ussuri district they are better bred and a bacon industry is developing.

The mineral wealth is as yet not completely surveyed. Gold output has diminished markedly since 1917 and will probably need to be put on a machine using basis in place of the old hand methods; it is mainly obtained from alluvial washings. The rich quartz deposits could not be profitably exploited under present conditions. Climatic conditions make work possible only in summer, and most of the gold is found in places where the ground never really thaws; if the summer is dry, water for washing is deficient; if wet, flooding is troublesome. Population is scanty, roads almost non-existent and the cost of bringing machinery and food supplies is exceedingly heavy. The chief regions are the Nerchinsk, the Zeya and its tributaries, the Bureya, and especially its tributary, the Niman; Blagovyeschensk and Zeya-Pristan have government gold laboratories. The Amgun mines near Kerbinski have proved too costly to exploit, but the Orsk mines on Lake Chlya, near Nikolaevsk, are more successful. The more accessible mines in the Ussuri district are worked out, but a new source has been opened on the Iman river. Quartz gold was extracted formerly from Askold island near Vladivostok. The silver mines of Nerchinsk, in Transbaikal, which were worked as early as 1704 and reached their maximum output in 1774, are no longer worked, since the easily reached layers are exhausted and the Kirghiz silver mines are more productive. Zinc and silver-lead mines are worked near Tyutikha bay and Soviet bay. Wolfram, bismuth, asbestos, platinum, molybdenum, osmiridium and tin are found and many precious stones, unworked for lack of demand. Antimony occurs in quantity in the Amur province. Brown coal of a low calorific value has been mined in the Transbaikal and Amur province since the coming of the railway. In the Maritime province both brown coal and a better variety are mined for the Ussuri railway, but the best coal is obtained from Sakhalin; the Japanese markedly developed the mines during their occupation. The eastern shores of Sakhalin also produce good quality naphtha, and this and the coal are worked by a Japanese concession. Iron was worked in the Transbaikal in the 18th century and an iron foundry existed at Petrovsk on the Balaga river; it declined after the opening of the trans-Siberian railway, but revived temporarily in 1914-22. Chinese competition, with better fuel and ore conditions, is now reducing its prosperity. The Olga bay iron industry is more prosperous. North-east Kamchatka has undeveloped resources of gold, platinum, silver-lead ore, iron, coal, granite, marble and naphtha. In 1925 concessions were granted to the following British firms, (1) "Lena Goldfields" for 30 years. (2) "The Priamur Mines" for 36 years to develop the iron, zinc, lead and silver at present unworked in the Olga bay district. (3) "The Tetukhe Mining Corporation" for 36 years to develop the zinc, silver, lead and sulphate near the Tetukhe river. (4) "The Ayan Corporation" for 36 years to work the gold mines in Kamchatka. The industries of the Far Eastern Area are at present mainly restricted to peasant products for local needs, homespun, sewn leather footwear, flour-milling, etc. Leather is distinctly a peasant industry, except in Vladivostok and the Transbaikal. Vladivostok and Blagovyeschensk are important flour-milling centres, and a macaroni industry was established at the former town in 1923. Both towns have shipbuilding and repairing industries; the latter for the Amur river fleet. The former Khabarovsk arsenal now produces agricultural implements. The damage to the railway bridges and rolling stock and to the river fleet during 1914-1922 is still

felt. Roads are lacking in many places and are often impassable in the rainy season. The opening of the final railway link between Khabarovsk and the Transbaikai in 1914-15, has not yet had time to make its influence felt. Coastal transport is difficult owing to the uncharted seas and the summer fogs and winter ice. The Far Eastern Area thus presents itself as an area of potential wealth as yet undeveloped. Its present exports of timber, fish, furs, coal, oats, beans, rice, hempseed and bran hardly cover its imports of grain, fats, tea, sugar, meat, cattle, agricultural and other implements, machinery and small necessities such as paper, soap and chemicals. The seasonal nature of its industries and the difficulties of agriculture, combined with transport difficulties are a check on colonization, and yet intensive colonization is the only means of creating a demand for manufactures of a non-seasonal character. Its chief towns (*q.v.*) are Vladivostok, Blagovyeschensk, Khabarovsk, Chita and Nerchinsk.

Native Tribes.—Many native tribes still survive. Until recently the Palaeo-Siberian races, akin to the North American Indians, occupied all eastern Siberia and some Japanese islands. They have been pressed out by invaders towards the north-east, and of the present 35,000 population of Kamchatka, about 30,000 are natives. The Chukchee are the most important. Their original territory was mainly from east of Chaun bay to the north of the Anadyr region, but the increase of their reindeer herds has caused them to expand, at the expense of the Yukaghirs. They inhabit the tundra and its taiga fringe, seeking the latter for shelter in the autumn and camping in summer near a glacier or in the open tundra. They were probably originally a maritime people who later developed reindeer breeding and they are today divided into the Reindeer and the Maritime Chukchee. The latter live mainly by seal and walrus hunting and their boats are made from walrus hide. The Reindeer Chukchee hunt wild reindeer, wolves, bears and foxes to supplement their reindeer breeding. The Koryak tribe, closely related to the Chukchee, extends from the Stanovoi mountains to the sea, and along the west coast of Kamchatka to lat. 55° N. They are also divided into a Maritime and a Reindeer section, the latter intermarrying with the Chukchee and the former with the Kamchadals. They fish, hunt and breed reindeer, and have developed much artistic skill in carving wood, ivory, whalebone and horn and in basketwork and rug-making. Kamchadal is a name applied to the principal tribe of the Kamchatkan peninsula; pure aborigines are rare, much intermixture between them and escaped convicts having occurred. Their chief occupation is salmon fishing, though some are hunters and trappers. They train sledge dogs and are expert sledge drivers. The Gilyaks of the coastal region on either side of the Amur present an ethnological problem, one type approximating to the Amu, another to the Tungus and a third being distinct from either. Hunting, fishing and trading are their chief occupations and till recently they carried on a slave trade with the Ainu and Goldi. The bear is their sacred animal, and there is a bear cage near each of their villages. A few Eskimo are found in the north and a few Aleuts in the Commander islands.

Of the Neo-Siberian tribes, sometimes called the Ural-Altaic, the Tungus are the most important in this region; they are a branch of the same Mongolic tribe as the Manchu. They stretch from the Taimir peninsula along the Yenisei valley across the Vitim plateau to the sea coast almost from Korea to Kamchatka; the Amur and Ussuri are Tungus streams. The Lamuts and Olennye of the Chukchee peninsula are a branch of the Tungus. The southern Tungus fall into two linguistic groups, one including the Orochon, Manegir, Birar and Kile, the other the Olcha, Oroke, Negda and Samagir. Physical and linguistic divisions do not, however, correspond, *e.g.*, the Olcha resemble the Gilyaks physically, and the Samagir resemble the Goldi of the Amur, Ussuri and Sungari region. In Transbaikai many Tungus have become sedentary and intermingled with the Russian settlers, but the nomadic cattle-breeding Tungus, forming about 45% of the whole, have preserved their nationality and language and are demanding recognition of an autonomous area. The Buriats of Transbaikai are the principal Mongol tribe in Siberia; the eastern branch is known as the Aga-Buriat, as distinct from the Buriat Mongol

(*q.v.*). In 1925 the first congress of native peoples of the Transbaikai, Amur and Primorsk regions was held. It laid down a broad basis for preserving native cultures and suggested plans, (1) for combating shamanism (*q.v.*), the sale of women, and the spread of such diseases as syphilis, leprosy, etc., (2) for establishing co-operation among the natives to prevent their exploitation, (3) for enabling the natives to adapt themselves gradually to timber and other industries, in view of the fall in the value of hunting and fishing. Though as yet it is early to expect results, the congress is significant of a new outlook on problems of the relations of native tribes and incoming settlers and traders. In 1926 a station providing veterinary aid to native reindeer breeders and medical help for the natives was established in St. Lawrence bay near Bering strait.

Colonization.—The history of the opening up of the Far Eastern region is full of romantic interest, and the hardships suffered in its wild country and inhospitable climate were perhaps greater than in opening up any other region. The wealth of fur attracted traders from early times. The Cossack Dezhnev in 1648, after whom East Cape has been re-christened Dezhneva, sailed through Bering strait eighty years before Bering, and discovered the Anadyr, where he was joined by other Cossacks who had come by land from the Kolyma river along the Anyui and over the watershed. In 1647 Okhotsk fortress was built and by 1697 Kamchatka was explored and a fortress built at Verkhne-Kamchatsk. In 1643 Poyarkov sailed down the Zeya and the Amur to the Pacific and returned via Okhotsk. In 1649-50 Khabarov, a merchant of Olekminsk sailed down the Amur and wintered at the place which now bears his name. He also selected the future Blagovyeschensk as a suitable site. About this time Verkhne-Udinsk and Nerchinsk were founded, but the Amur was ceded to China in 1689. The final occupation of the Amur is mainly due to Count Muraviev-Amurski, who, in 1849, sent Nevelski to explore the mouth of the river, and Nikolaevsk was founded by him. Two years later de Castries bay and Mariinsk were occupied and outposts established in Sakhalin. The journeys of Middendorf, 1844-45; Akhte and Schwarz, 1852, and in 1854-57 of the Siberian expedition increased the knowledge of and interest in the district. At the same time the Siberian branch of the Russian Geographical Society was formed in Irkutsk as a centre for Siberian research. During the Crimean War, Petropavlovsk in Kamchatka was successfully held against the English and French, and later a flotilla was sent down the Amur to help the Pacific fleet. The settlement of peasants along the left bank began in 1856 with colonies at the mouth of the Kumara, the Zeya and the Sungari, and at the entrance to the Little Khingan gorge. In 1858, by the treaty of Aigun, China ceded to Russia the left bank of the Amur from the Argun to the sea, and the Peking Convention of 1860 confirmed the cession to Russia of the Ussuri region. For some years a zone of free trade existed along the frontier, but this was discontinued in 1912 and much smuggling now goes on. In 1872 Vladivostok was made the Russian Pacific Naval base. In 1896 Russia abandoned the longer and more difficult railway route along the Amur in Russian territory in favour of a joint Chinese-Russian railway through Manchuria to link the Transbaikalia railway with Vladivostok, and in 1898 obtained the lease of Port Arthur, and after the Boxer rebellion of 1900 established herself in Manchuria and Korea. But by the Treaty of Portsmouth 1905, at the end of the Russo-Japanese war, Russia recognized Japan's right to Korea, ceded her rights to Port Arthur and retired from Manchuria. Sakhalin was divided between Russia and Japan at lat. 50° and Japan gained fishing rights in the Bering and Okhotsk seas. Russia was then compelled to build the Amur railway which was completed in 1915. Following on the 1917 revolution, a rising took place in Vladivostok in 1918, and Japanese and British naval forces occupied the town. Much confused fighting took place, Semenov's troops, the retreating Czecho-Slovak army, the White Guards, Allied troops and especially Japanese troops and Bolshevik forces all taking part. From 1920 to 1922 an independent Far Eastern Republic existed, but in November 1922 the Soviet power finally established itself and the Far Eastern Area was incorporated in

the R.S.F.S.R., though the Japanese did not evacuate northern Sakhalin until May 1925. Colonization in the area was attended in early days with great difficulties and casualties were heavy. The region of oldest settlement is the Transbaikalia, where Cossacks were established in the middle of the 17th century; thence they were progressively moved eastwards, settling on the Amur river in 1857. In 1869 peasant colonization of the Amur district began and the opening of the Odessa to Vladivostok sea route in 1878, which lessened the transit time from two years of difficult land travel to a few weeks' sea voyage, gave a great impetus to the settlement of the Maritime and Ussuri districts. Besides Cossacks and peasants political and religious refugees and exiles also settled in the district and have formed a valuable element in the population. Some, notably Bogoras in his studies of the peoples of the Chukchee region, have added considerably to the scientific exploration of the district. Criminal exiles, on the other hand, have been a great source of disorder; many convicts escaped and they and the ex-convicts whose term of imprisonment was completed, frequently terrorized the native tribes and settlers. In 1907 the custom of sending criminals to Sakhalin island was discontinued. Since 1925 the Soviet government has been offering special facilities to settlers in the Far East, especially to those intending to work in the lumbering and fishing industries, and arrangements are being made for the settlement in 1928-29 of about 150,000 men, with their wives and families, in the Primorsk region. Schemes are also being worked out to bring settlers from the Caspian fishery district and to encourage them to combine cattle breeding and fishing. There is much infiltration of Koreans, Chinese and Japanese into the district, the two latter as traders and craftsmen; the Koreans, with their frugal and industrious habits and their familiarity with difficult local conditions, are specially fitted to become agricultural settlers. It is estimated that in 1923, 90% of Koreans in this area were cultivators, some even settling in Kamchatka, while only 23% of Chinese were landworkers. So far all attempts to settle Russians in Kamchatka have proved unsuccessful. A striking feature of the colonization of the area has been the rapid growth of the towns. Blagovyeschensk increased from 32,834 in 1897 to 57,500 in 1926; Vladivostok from 28,896 to 102,454; Khabarovsk from 14,971 to 43,567; Nikolaevsk-Ussuri from 10,868 to 32,121; Chita from 11,511 to 57,731 and even Petropavlovsk in Kamchatka has increased from 398 to 1,670. This growth in spite of the troubled conditions and lack of development of the surrounding districts is an indication of the probable future importance of the region.

FAREHAM, a market town and seaport in the Fareham parliamentary division of Hampshire, England, 84½ m. S.W. from London by the S.R., is a junction station on the line from Portsmouth to Southampton, with branch to Gosport and Stokes Bay on the south, and north-west to Eastleigh. Pop. of urban district (1931) 11,575. It lies at the head of a creek opening into the north-western corner of Portsmouth harbour. The principal industries are the manufacture of sackings, ropes, bricks, coarse earthenware, terra-cotta, tobacco-pipes and leather. Fareham has a considerable trade in corn, timber and coal, the creek being accessible to vessels of 300 tons. Three miles E. of Fareham, on Portsmouth harbour, are the interesting ruins of Porchester castle, an extensive walled enclosure retaining its Norman keep, and exhibiting in its outer walls considerable evidence of Roman workmanship. St. Mary's parish church (rebuilt and restored in the last century) retains some fine Norman portions; it belonged to an Augustinian priory founded by Henry I. At Titchfield, 3 m. W. of Fareham, are ruins of the beautiful Tudor mansion, Place house, on the site of a Premonstratensian abbey of the 13th century, of which there are also fragments. At Knowle, 3 m. N.N.W.

of Fareham, is the large county asylum, where in 1927 there were over 1,000 patients. Fareham became an urban district in 1894. The council owns the water and electricity supplies.

The fact that Fareham (Fernham, Ferham) formed part of the original endowment of the see of Winchester fixes its existence certainly as early as the 9th century. It is mentioned in the Domesday Survey as subject to a reduced assessment on account of its exposed position and liability to Danish attacks. There is evidence to show that Fareham had become a borough before 1264, but no charter can be found. It was a mesne borough held of the bishop of Winchester, but it is probable that during the 18th century the privileges of the burgesses were allowed to lapse, as by 1835 it has ceased to be a borough. Fareham was represented in the parliament of 1306, but two years later it petitioned against representation on the ground of expense. A fair was held under grant of Henry III., and in the 18th century was mainly important for the sale of toys; it was abolished in 1871. Fareham in mediaeval times was a free port and had a considerable trade in wool and wine.

FAREL, GUILLAUME (1489-1565), French reformer, was born of a noble family near Gap, Dauphiné. He studied in Paris under Jacobus Faber (Stapulensis), on whose recommendation he was appointed professor in the college of Cardinal Lemoine. In 1521, on the invitation of Bishop Briçonnet, he went to Meaux, and took part in efforts of reform within the Roman communion. The persecuting measures of 1523, from which Faber found a refuge at Meaux, determined Farel to leave France. Oecolampadius welcomed him to Basel, where in 1524 he put forth thirteen theses sharply antagonizing Roman doctrine, and defended them with so much heat that Erasmus joined in demanding his expulsion from the city. He thought of going to Wittenberg, but his first halt was at Strassburg, where, Bucer and Capito received him kindly. At the call of Duke Ulrich of Württemberg he went as preacher to Montbéliard, but was forced to leave early in 1525.

Retracing his steps to Strassburg and Basel, at the end of 1526 he obtained a preacher's post at Aigle, then a dependency of Bern, and, with reference to his protection by that city, adopted the pseudonym Ursinus. He obtained in 1528 a licence from the authorities to preach anywhere within the canton of Bern, but extended his labours to the cantons of Neuchâtel and Vaud, in Oct. 1530 breaking into the church of Neuchâtel with an iconoclastic mob. In 1532 he visited the Waldenses and on the return journey halted at Geneva, then at a crisis of political and religious strife. On June 30, 1532, the Council of Two Hundred had ordained that in every church and cloister of the city "the pure Gospel" should be preached; against this order the bishop's vicar led the opposition. Reaching Geneva in Oct. 1532, Farel at once began to preach at his lodging, and soon attracted crowds. Summoned before the bishop's vicar, he was violently thrust from the court and bidden to leave the city within three hours. He escaped with difficulty to Orbe by boat. Through the intervention of the government of Bern, liberty of worship was granted on March 28, 1533 to the Reformation party in Geneva. Farel, returning, achieved in a couple of years a complete supremacy for his followers. On New Year's Day 1534 the bishop interdicted all preaching unauthorized by himself, and ordered the burning of all Protestant Bibles. This was the signal for public disputations in which Farel took the leading part on the Reformation side, with the result that by decree of Aug. 27, 1535 the mass was suppressed and the reformed religion established. Calvin, on his way to Basel for a life of study, touched at Geneva, and by the importunity of Farel was there detained to become the leader of the Genevan Reformation. The severity of the disciplinary measures which followed procured a reaction under which Farel and Calvin were banished the city in 1538. Farel was called to Neuchâtel in July 1538, but his position there was made untenable, though he remained at his post during a visitation of the plague. When (1541) Calvin was recalled to Geneva, Farel also returned; but in 1542 he went to Metz to support the Reformation there. In 1544 he returned to Neuchâtel. No one was more frequently and confidentially consulted by Calvin. When the trial of Serve-

tus was in progress (1553), Calvin was anxious for Farel's presence, but he did not arrive till sentence had been passed. He accompanied Servetus to the stake, vainly urging him to a recantation at the last moment. Calvin's death, in 1564, affected Farel deeply. He died at Metz on Sept. 13, 1565.

See C. Ancillon, *Vie de G. Farel* (1691); the article in Bayle; M. Kirchhofer, *Das Leben W. Farel's* (1831-1833); Ch. Schmidt, *Études sur Farel* (1834); F. Bevan, *W. Farel* (1893); J. J. Herzog, in Herzog-Hauck's *Realencyklopädie* (1898).

FARGO, WILLIAM GEORGE (1818-1881), pioneer American expressman, was born in Pompey (N.Y.), on May 20, 1818. He became a freight agent for the Auburn and Syracuse Railway Co. in 1841, and express messenger between Albany and Buffalo a year later, and in 1843 a resident agent in Buffalo. In 1844 he organized, with Henry Wells (1805-78) and Daniel Dunning, the first express company to engage in the carrying business west of Buffalo. The lines of this company were rapidly extended to Chicago, St. Louis, and other western points. In March 1850, when the American Express Co. was organized, Fargo became secretary, and in 1851 he organized the firm of Wells, Fargo and Co. to conduct an express business between New York and San Francisco by way of the Isthmus of Panama. In 1861 Wells, Fargo and Co. bought the Overland Mail Co., of which Fargo had been one of the original promoters. From 1862-66 he was mayor of Buffalo, and from 1868 to his death, in Buffalo, on Aug. 3, 1881, he was president of the American Express Co. He was a director of the New York Central and of the Northern Pacific railways.

FARGO, the largest city of North Dakota, U.S.A., on the eastern boundary of the State, on the Red river, opposite Moorhead, Minn., and 25 m. N.W. of St. Paul; the county seat of Cass county. It is on Federal highways 10 and 81; has a municipal air port; and is served by the Chicago, Milwaukee, St. Paul and Pacific, the Great Northern and the Northern Pacific railways. The population in 1925 (State census) was 24,921, and was in 1930, 28,619 by the Federal census. About 15% are of foreign birth, chiefly Scandinavian and Canadian. Fargo is the most important city in the Red river valley ("the granary of the world"). It is an important market for farm-machinery and has a large general wholesale trade. Wholesale transactions in 1926 amounted to \$37,745,500; retail trade to \$19,652,600. The factory output in 1927 was valued at \$5,571,055. The assessed valuation of property in 1927 was \$32,177,435. Bank debits to individual accounts in 1926 amounted to \$186,238,000. Fargo is the seat of several private schools, and of the North Dakota agricultural college, which was provided for by the State Constitution, and established in 1890 by the first legislative assembly. It owns 1.5 sections of land in the north-western part of the city and extending beyond the city limits, of which 100 ac. is used for the campus. The biennial appropriation for maintenance in 1925 was \$543,000. Resident enrolment (exclusive of correspondence courses) is over 1,400. The agricultural experiment station maintains branches at Langdon, Edgeley, Dickinson, Hettinger, McLeod and Williston. A tent colony was established here when the Northern Pacific crossed the river in 1871, and permanent settlement began in 1873, after the Indian title to the land had been extinguished. The city was chartered in 1875, and was named after W. G. Fargo, of Wells, Fargo and Company. It has a commission form of government. The population was 5,664 in 1890; 9,589 in 1900; 14,331 in 1910; and 21,961 in 1920.

FARIA Y SOUSA, MANUEL DE (1590-1649), Spanish and Portuguese historian and scholar, commentator of *Os Lusíadas* and author of a history of the Portuguese in all parts of the world. This work appeared in portions after his death under the titles: *Europa Portuguesa* (1667); *Asia Portuguesa* (1666-75); *Africa Portuguesa* (1681).

FARIBAULT (fârî-bō), a city of Minnesota, U.S.A., situated on the Cannon river, about 50 m. S. of St. Paul; the county seat of Rice county. It is on Federal highway 65, and is served by the Chicago Great Western, the Chicago, Milwaukee, St. Paul and Pacific, the Minneapolis, Northfield and Southern, and the Rock Island railways. The population was 11,089 in

1920 (88% native white) and was in 1930, 12,767 by the Federal census. It is in a farming and dairying country, and on the eastern edge of the beautiful lake region of southern Minnesota. Its diversified manufacturing industries had an output in 1927 valued at \$6,767,670, and there are five nurseries within the city. The largest peony farm in the country is here. Faribault is the seat of the State schools for the deaf (established 1863), for the blind (1874), and for the feeble-minded (1879); of the Seabury Divinity school (Protestant Episcopal; incorporated 1860) and several private academies; and of the cathedral of Our Merciful Saviour (1868-69), the first Protestant Episcopal church in the United States built and used from the outset as a cathedral. Jean Baptiste Faribault, a French fur-trader and pioneer, made his headquarters in this region in the latter part of the 18th century. Permanent settlement dates from 1848, and the city was incorporated in 1872. A French millwright, Le Croix, introduced here, about 1860, a process of making flour which revolutionized the industry in the United States. His mill was soon destroyed by flood, and he moved to Minneapolis, where the process was adopted on a large scale. Faribault was the home for a time of Gen. James Shields (1810-79); and for many years of Bishop Henry Benjamin Whipple (1859-1901), the pioneer bishop of the Protestant Episcopal church in Minnesota, famous for his missionary work among the Indians.

FARIDKOT, an Indian State in the Punjab. One of the Cis-Sutlej States, under British influence since 1809. Area 638 sq. m., and population in 1921, 150,661. The chief, Raja Pahar Singh was rewarded with increase of territory for service to the British in the first Sikh war. In the mutiny of 1857, too, his son and successor, Wazir Singh, did good service. Estimated gross revenue £138,000. Faridkot is irrigated by a branch of the Sirhind canal. The State contributed large sums and the services of sappers and other troops for the World War.

FARIDPUR, a town and district of British India, in the Dacca division of Bengal. The town, which has a railway station, stands on an old channel of the Ganges. Pop. (1921), 14,503. There are a Baptist mission and a college. The district has an area of 2,371 sq. m. and a population of 2,249,858. In the north the land is comparatively high, with a light sandy soil, covered with water during the rainy season, but dry during the cold and hot weather. From the town of Faridpur the ground slopes, until in the south, on the confines of Bakarganj, it becomes one immense swamp, never entirely dry. The villages are built on artificially raised sites or the high banks of the deltaic streams. Along many of the larger rivers the line of hamlets is unbroken for miles together, so that it is difficult to say where one ends and another begins. The plains between the rivers are almost invariably more or less depressed towards the centre, where usually a marsh or lagoon is found. These marshes, however, are gradually filling up by the silt deposited from the rivers; in the north of the district there now only remain two or three large swamps, and in them the process may be seen going on.

The principal rivers are the Ganges, the Arial Khan and the Haringhata. The Ganges, or Padma as it is locally called, flows along its northern boundary as far as Goalundo, where it receives the waters of the Jamuna or main stream of the Brahmaputra; thence the united stream turns southwards and forms the eastern boundary of the district. Rice is the great crop of the district.

The north of the district is crossed by the line of the Eastern Bengal State railway to Goalundo, an important place of call for the Ganges and Brahmaputra steamers, and a branch runs to Faridpur town. Most of the trade is conducted by river. The subdivisional town of Madaripur (pop. 25,297) in the south of the district, is a centre of steamer traffic and also of the jute-baling industry of eastern Bengal.

See J. C. Jack, *The Economic Life of a Bengal District* (1916).

FARĪD UD-DĪN 'ATTĀR (1119-1229), Persian poet and mystic, was born at Nishapur, c. 513 A.H. (A.D. 1119), and was put to death c. 627 A.H. (A.D. 1229). His real name was Abu Talib (or Abu Hamid) Mohammed ben Ibrahim, and Farīd ud-dīn was simply an honourable title equivalent to Pearl of Religion. He followed for a time his father's profession of druggist or per-

fumer, and hence the name 'Attar (one who sold 'itr, otto of roses; hence, simply, dealer in drugs), which he afterwards employed as his poetical designation. Farid soon gave up his shop and began to study the mystic theosophy of the Sufis under Sheik Ruknaddin, and before long was recognized as one of its principal representatives. He travelled extensively, visited Mecca, Egypt, Damascus and India, and was invested with the Sufi mantle by Sheik Majd-ud-din of Baghdad. The greater portion of his life was spent in the town of Shadyakh, but he is not unfrequently named Nishapuri, after the city of his boyhood and youth. Farid was a voluminous writer, and left no fewer than 120,000 couplets of poetry, though in his later years he carried his asceticism so far as to deny himself the pleasures of poetical composition. His most famous work is the *Mantik uttair*, or language of birds, an allegorical poem containing a complete survey of the life and doctrine of the Sufis. It is extremely popular among Mohammedans both of the Sunnite and Shiite sects, and the manuscript copies are consequently very numerous. The birds, according to the poet, were tired of a republican constitution, and longed for a king. As the lapwing, having guided Solomon through the desert, best knew what a king should be, he was asked whom they should choose. The Simorg in the Caucasus, was his reply. But the way to the Caucasus was long and dangerous, and most of the birds excused themselves from the enterprise. A few, however, set out, but by the time they reached the great king's court, their number was reduced to thirty. The thirty birds (*si morg*), wing-weary and hunger-stricken, at length gained access to their chosen monarch the Simorg; but only to find that they strangely lost their identity in his presence—that they are he, and he is they. In such strange fashion does the poet image forth the search of the human soul after absorption into the divine.

The text of the *Mantik uttair* was published by Garcin de Tassy in 1857, a summary of its contents having already appeared as *La Poésie philosophique et religieuse chez les Persans* in 1856; this was succeeded by a complete translation in 1863. Among Farid ud-din's other works may be mentioned his *Pandnāma* (Book of Counsel), of which a translation by Silvestre de Sacy appeared in 1819; *Bulbul Nama* (Book of the Nightingale); *Wasilet Nama* (Book of Conjunctions); *Khusru va Gul* (The King and the Rose); and *Tadhkiratu 'l Awliyā* (Memoirs of the Saints) (ed. R. A. Nicholson in *Persian Historical Texts*).

(London, 1798), pp. 84, 124, containing translations of part of the *Pandnāma*; E. H. Palmer, *Oriental Mysticism* (1867); E. G. Browne, *Literary History of Persia* (1906).

FARINA, SALVATORE (1846-1918), Italian novelist, was born at Sorso, Sardinia, on Jan. 10, 1846, and after studying law at Turin and Pavia settled in Milan. He wrote *Il Signor Io* (1880), *Il Tesoro di Donnina* (1873), *Amore a cent'occhi* (1883), and other volumes. He died Dec. 15, 1918.

See his own *Ricordi* (1910-13); also V. Dendi, *Uno romanziere dimenticato: Salvatore Farina* (Pisa, 1921).

FARINA (food): see **POTATO**.

FARINACCI, ROBERTO (1892-), Italian politician, was born Oct. 16, 1892, at Isernia, in the province of Campobasso. Educated at Cremona, he entered the railway administration, becoming station-master at Cremona. While still a very young man he took to politics, and on the outbreak of the World War conducted an active interventionist propaganda. As soon as Italy went to war he volunteered for active service, but 18 months later was ordered to resume his civilian duties. After the Armistice he was one of the first to join Mussolini's Fasci di Combattimento and he organized the movement in Cremona. In 1921 he was returned to the Legislature as member for Mantova-Cremona, but was unable to take his seat in the Chamber, being under age. He had now become the leading figure in Cremona, and through the daily paper founded by him, *Cremona Nuova*, acquired an increasing influence in the Fascist party. He also found time to complete his studies and secured a university degree in law. When Mussolini came into power, although not given office, Farinacci continued to be one of the Premier's most trusted

advisers. In 1924 he was again returned to the Legislature and in March 1925 he became, on Mussolini's nomination, general secretary of the Fascist party. He was superseded (March 31, 1926), being succeeded by Augusto Turati (not to be confused with the Socialist deputy). The real reasons for the change were not divulged. In any case Farinacci remained a force in the party.

FARINATO, PAOLO (1524-1606), Italian painter, architect and engraver of the Veronese school. He was born at Verona and probably studied first under his father, Giovanni Battista, and then under Nicolo Giolfino. He was the head of a family of artists who were active in Verona for half a century as painters of façades and as decorators of walls in churches and palaces. Paolo's name first occurs in 1549, when Philip II. of Spain is said to have admired one of his pictures at Villafranca and expressed the desire to acquire it. His reputation was well established in 1552 when Ercole Gonzaga invited him to co-operate with Paolo Caliari, Domenico Brusasorci and Battista dal Moro in the decoration of Mantua cathedral, where his painting of St. Martin is still to be seen. There are numerous works by him in the churches of Verona (S. Maria Organo, San Nazaro e Celso, San Giovanni in Fonte) and in the neighbourhood. Among his last pictures, dated 1603, are the "Betrothal of St. Catherine" in the museum of Verona, and the "Miracle of the Loaves and Fishes," in the church of San Giorgio, a very large painting replete with figures, of which the master recorded with pride that he painted it in his 79th year. His style is characterized by marked peculiarities—by the overlong proportions of his figures, by their sometimes contorted poses, and by a feeling for space, pageant and movement. His colour scheme is low and silvery in tone, Vasari praises his compositions "with large number of figures, executed in good design." Though Paolo Farinato's paintings are rarely met with out of Verona, his drawings, easily recognizable by their pronounced style, are to be found in most of the great European collections. Among his first engravings are "Venus and Cupid" (1566) and "St. John the Evangelist" (1567). He often signed his engravings and paintings with the figure of a snail. From the year 1573 onward he kept a careful chronological register of his works with details of his contracts. There are, moreover, numerous architectural designs in the diary; and his activities as an architect in connection with the fortress of Palma and the Castello S. Felice at Verona are mentioned by Ridolfi. His death must have occurred soon after July 23, 1606, the date of his last will. He was buried in S. Paolo in Campo Marzo, having made arrangements for his tomb twelve years previously. He then, in 1594, adopted the surname of the distinguished Florentine family "Farinati degli Uberti," and used this name henceforth in his signatures, and inscribed it on his epitaph, although his ancestors were not connected with the Florentine patricians, but were probably sellers of bread—"farinati." Paolo's two sons, Orazio and Giovanni Battista, and his daughter Vittoria, were also painters. As the Farinati were among the most important artists in Verona at the time when Paolo Veronese was forming his style, they doubtless contributed to the local influences which moulded the early work of the greatest of Verona's painters; thus young Caliari worked in conjunction with a nephew of Paolo Farinato, Battista Farinato, called "Zelotti" (c. 1532-92). So similar was the work of these two young men that it is very difficult now to apportion it on stylistic evidence.

See Vasari Milanese and Ridolfi, *Le Maraviglie* (1648); L. Simeoni published the artist's register of his works in *Madonne Verona I. to V.*; Bartsch enumerates 10, and Passavant 11, engravings by the artist. (I. A. R.)

FARINELLI (1705-1782), whose real name was CARLO BROSCHE, one of the most extraordinary male soprano singers that ever lived, was born on Jan. 24, 1705, at Naples. He was the nephew of Cristiano Farinelli, the composer and violinist, whose name he took. He studied under N. A. Porpora, and, to the possession of a marvellous voice, added a brilliant technique. In 1722 he made his first appearance at Rome in his master's *Eumene*, arousing the greatest enthusiasm. Porpora had written an obbligation for a popular German trumpet player to one of the boy's songs, and the singer surpassed the trumpet, holding and swelling a note

of prodigious length, purity and power, and in the variations, roulades and trills which he introduced into the air. In 1724 he appeared at Vienna, and at Venice in the following year, returning to Naples shortly afterwards. He sang at Milan in 1726, and at Bologna in 1727, where he first met and acknowledged himself vanquished by the singer Antonio Bernacchi (b. 1700), to whose instruction he was much indebted. With ever-increasing success and fame Farinelli appeared in nearly all the great cities of Italy; and returned a third time to Vienna in 1731. He now modified his style, it is said on the advice of Charles VI., from mere *bravura* of the Porpora school to one of pathos and simplicity. He visited London in 1734, arriving in time to lend his powerful support to the faction which in opposition to Handel had set up a rival opera with Porpora as composer and Senesino as principal singer. But not even his aid could make the undertaking successful. His first appearance at the Lincoln's Inn Fields theatre was in *Artaserse*, much of the music of which was by his brother, Riccardo Broschi. His success was instantaneous, and the prince of Wales and the court loaded him with favours and presents. Having spent three years in England, Farinelli set out for Spain, staying a few months on the way in France, where he sang before Louis XV. In Spain, where he had only meant to stay a few months, he ended by passing nearly twenty-five years. His voice, employed by the queen to cure Philip V. of his melancholy madness, acquired for him an influence with that prince which gave him eventually the power, if not the name, of prime minister. This power he was wise and modest enough to use discreetly. For ten years, night after night, he had to sing to the king the same four songs, and never anything else. Under Ferdinand VI. he held a similar position, and was decorated (1750) with the cross of Calatrava. He utilized his ascendancy over this king by persuading him to establish an Italian opera. After the accession of Charles III. Farinelli was asked to leave Spain, but was allowed to retain his salary on condition that he lived at Bologna and not at Naples, the reservation being imposed for political reasons. He died at Bologna on July 15, 1782.

See G. Sacchi, *Vita del Cav. Don Carlo Broschi* (1784); C. Ricci, *Burney, Casanova et Farinelli in Bologna* (1890); J. Desastre, *Carlo Broschi* (1903); Franz Häbbeck, *Die Gesangkunst der Kastraten* . . . (1923).

FARINGDON, properly GREAT FARINGDON, a market town in the Abingdon parliamentary division of Berkshire, England, 10 m. N.W. of London on a branch of the G.W.R. from Uffington. Pop. of rural district (1931) 10,636. It lies on the slope of a low range of hills which borders the valley of the Thames on the south. The old church of All Saints, with low central tower, is mainly Transitional Norman and Early English, and contains many monuments and brasses, including those of the Unton family (16th century) and a chapel of the Pye family, to whom Faringdon house was restored after being held by the Royalists in the Civil War. The present mansion was rebuilt by Henry James Pye (1745-1813), poet laureate from 1790 to 1813, who also caused to be planted the conspicuous group of fir-trees on the hill east of the town called Faringdon Clump, or the Folly. Edward the Elder is reputed to have died at Faringdon in a palace of the Saxon kings.

FARINI, LUIGI CARLO (1812-1866), Italian statesman and historian, was born at Russi, near Ravenna, on Oct. 22, 1812. After completing a brilliant university course at Bologna, which he interrupted to take part in the revolution of 1831 (see CARBONARI), he practised as a physician at Russi and at Ravenna. In 1843 he was expelled from the Papal States. He resided successively in Florence and Paris, and travelled about Europe as private physician to Prince Jerome Bonaparte, but when Pius IX. was elected to the holy see and began his reign with apparently Liberal and nationalist tendencies, Farini returned to Italy and was appointed secretary-general to G. Recchi, the minister of the interior (March 1848). But he resigned with the rest of the ministry on April 29. Pius now sent Farini to Charles Albert, king of Sardinia, to hand over the command of the papal contingent to him. He was again secretary to the ministry of the interior in the Mamiani cabinet, and later director-general of the

public health department. He resigned office on the proclamation of the republic after the flight of the pope to Gaeta in 1849, resumed it for a while when Pius returned to Rome with the protection of French arms, but when a reactionary and priestly policy was instituted, he went into exile at Turin. There he contributed to Cavour's paper *Il Risorgimento*, in *La Frusta* and *Il Piemonte*, of which latter he was at one time editor. He also wrote his chief historical work, *Lo Stato Romano dal 1815 al 1850*, in four volumes (Turin, 1850). In 1851 he was appointed minister of public instruction in the D'Azeglio cabinet, an office which he held till May 1852. In the Sardinian parliament and in the press Farini was a staunch supporter of Cavour (*q.v.*), and urged that Piedmont should participate in the Crimean War, if indeed he was not actually the first to suggest that policy (see G. B. Ercolani's letter in E. Parri's memoir of Farini). In 1856 and 1857 he published two letters to Gladstone on Italian affairs, which created a sensation. When on the outbreak of the war of 1859 Francis V., duke of Modena, was expelled and a provisional government set up, Farini was sent as Piedmontese commissioner to that city; but although recalled after the peace of Villafranca he was determined on the annexation of central Italy to Piedmont and remained behind, becoming a Modenese citizen and dictator of the state. He negotiated an alliance with Parma, Romagna and Tuscany, when other provisional governments had been established, and entrusted the task of organizing an army for this central Italian league to General Fanti (*q.v.*). Annexation to Piedmont having been voted by *plebiscite* and the opposition of Napoleon III. having been overcome, Farini returned to Turin, when the king conferred on him the order of the Annunziata and Cavour appointed him minister of the interior (June 1860), and subsequently viceroy of Naples; but he soon resigned on the score of ill-health. Cavour died in 1861, and the following year Farini succeeded Rattazzi as premier, in which office he endeavoured to carry out Cavour's policy. Ill health compelled his resignation in 1863, and he died on Aug. 1, 1866.

His son Domenico Farini had a distinguished political career and was at one time president of the chamber.

BIBLIOGRAPHY.—Several letters from Farini to Mr. Gladstone and Lord John Russell were reprinted in a *Mémoire sur les affaires d'Italie* (1859), and a collection of his political correspondence was published under the title of *Lettres sur les affaires d'Italie* (Paris, 1860). His historical work was translated into English in part by Mr. Gladstone and in part under his superintendence. See E. Parri, *Luigi Carlo Farini* (Rome, 1878); L. Carpi in *Il Risorgimento Italiano*, vol. iv. (Milan, 1888); and G. Finali's article, "Il 27 Aprile 1859," in the *Nuova Antologia* for May 16, 1903.

FARM, in the most generally used sense, a portion of land leased or held for the purpose of agriculture; hence "farming" is equivalent to the pursuit of agriculture, and "farmer" to an agriculturist. (See AGRICULTURE; DAIRY; FARM MANAGEMENT, etc.)

FARM ACCOUNTS: see FARM MANAGEMENT.

FARMAN, HENRI, French airman, the son of an English journalist, born in Paris, May 26, 1874, was first a bicycle racer, then a painter, later a racing motorist. With his brother Maurice he made a successful biplane; in 1908 he made the first aerial voyage from Bouy to Reims, won the *grand prix d'aviation* and in 1909 the Michelin cup. He founded the Farman works at Boulogne-sur-Seine, making many aeroplanes, including the *Goliath*, which made a voyage to Dakar in 1919. In 1920 he flew to Constantinople, establishing a world record for flight duration and the world height record. He obtained a prize for establishing a record by remaining in the air for 34 hours.

So successful were the efforts of the brothers Farman to produce a practical flying machine that a special type of aeroplane soon became known as the Farman machine. The first trials of the Farman aeroplane were conducted at Issy-les-Moulineaux, during the period November 1907-January 1908. Henri Farman was the first aviator to fly 100 miles (1909). As early as 1908 he established a school of aviation and construction works at Buc, near Versailles.

His brother, Maurice, established works for aeroplane construction at a later date, but in 1912 the two brothers united their resources in merging their mutual interests. They supplied

machines not only to the French military authorities but to other countries and the Farman aeroplane was well tried and approved during the World War. Other aeroplanes have improved considerably on some of the earlier Farman models, but to the Farman brothers belongs the credit of the early biplane successes.

FARM BUILDINGS. There is such variety in the character and management of agricultural holdings that there must needs be equally great variety possible in the designs of the farm buildings. The farmhouse and labourers' cottages could be included under this heading, but they are omitted in this reference which will be restricted to the outbuildings.

Farms may be divided roughly into the following classes, pastoral farms, arable farms, mixed farms and dairy farms, but there are a great number of modifications of these systems. Local customs and climatic variations also have important effects upon the design of homesteads, but the chief aim in all cases is to have just those buildings which will satisfy the primary object of the farm, the suitability of each building for its purpose and its convenience for economic work being very important to ensure success in farming.

The usual homestead consists of several units bearing no relation to one another as a result of additions and alterations which have been made from time to time. This lack of proper arrangement costs the farmer much time and labour which should be and can be saved if the buildings are in a compact group and well arranged.

They may be advantageously planned in one rectangular block because this form lends itself to their best arrangement for economy in the working of the farm. Such a plan results also in the saving of floor and roof areas, external walls and length of drainage and, in consequence, of erection and expense in maintenance.

The primary points which demand most careful thought and consideration are situation, water supply and drainage. As to situation, the best aspect is generally south or south-east because it admits of an arrangement by means of which the rays of the sun are able to visit every part of the steading at some time during the course of the day. With a view to easy disposal of drainage, the steading should be built on a slope and on, or within easy distance of, a public road in order to minimise the expense of the upkeep of private roads. It should be as near as possible to the centre of the farm, but this desideratum should not be allowed to outweigh the other considerations. Physical difficulties may be present to affect the question and in the case of some types of mixed farms it might be conveniently placed in or near to the centre of the arable portion, because the carting in such instances is a big item. Again, if a river or stream is available and capable of affording a constant supply of water throughout the year it might be placed next to it even if it were not in or near the centre of the farm by so doing.

The water supply, by whatever means provided, should be laid on at different and suitable points or, at any rate, the central source of supply should be in the most accessible and convenient places as regards the stable, cowsheds and yards.

The drainage requires two separate systems, one to deal with the roof and surface water and the other to carry off liquid manure. If the water is not collected for use from roofs the surface drains may empty into the nearest field, ditch or pond. The liquid manure should be drained off on approved methods to a liquid manure tank which if possible should be placed in a central position so as to save expense. The liquid voided by live stock has a very high manurial value and should be properly conserved.

After these initial considerations attention should be given to the grouping of the buildings, and here the main principles are the same in nearly all classes of homesteads. The food department should be adjacent to the cattle sheds and communicate with them by means of internal passages; the disposal of the manure should be convenient and the yards should be of economic size and accessible, so that the stock may be conveniently watered and fed.

For small holdings the number of buildings is reduced to a minimum and will consist of the barn to the north with cattle

sheds adjoining to the south, thus keeping the food department close to the stock and satisfying the first principle of economic grouping.

From this nucleus extension may be made to any size of holding. Taking as an example a mixed farm of from three to four hundred acres, the block plan will consist usually of from three to four ranges of buildings. The north range is comprised of the taller buildings of two stories and provides the food department. On the ground floor of this range are, from left to right, the implement shed; the root shed; the mixing room in which all the food for the stock is prepared, the roots sliced or pulped and the chaff, corn and cake collected; the fodder store and the cart shed. On the floor above and over the root store extending to the cart shed are the cake room, chaff cutting room and granary. The chaff, cake and corn are delivered into the mixing room by means of traps or shoots. A feeding passage runs the whole length of this range on the ground floor and communicates with the cattle sheds which are generally placed at right angles to it and in the middle of the block, the yards being on either side of them. On a dairy farm, however, the cowsheds should be further away from the yards and may occupy the south range.

Covered yards, well ventilated, are best as they afford shelter both to stock and manure and for that reason are an improvement on the old open yards; the manure made in them is often as much as 50% better than that produced in open yards.

Lighting and ventilation of all the animal sheds, as well as their drainage, should be of the most efficient kind. Light should be admitted through walls, roof or both where possible and ventilation should be introduced by means of inlets at a low level and outlets at the highest points of the buildings. A free circulation of cold, fresh air goes a long way to promote the health of the stock and give them a sound constitution but it is important that the backs of the animals should not be exposed to draughts. The floors of the cowsheds should be constructed of such material and in such a manner as to render it practicable to remove all liquid matter which may fall on them and the channels should be made of an impervious material.

A double cowhouse is proportionately less costly than a single one for a large number of cows. The cows may be planned to stand back to back or facing one another with a feeding passage down the middle of the building; if sufficient width is given to the feeding passage the latter is probably the better arrangement but on the other hand it entails the keeping clean of two dunging passages.

The cattle sheds and yards are bounded by the east, west and in some instances a south range which comprise the remaining structures needed to make the set of buildings complete for the object of the farm. These may include boxes, nag stall, trap house, tool-shed, workshop, etc. Stables should be sheltered, situated on a hard road and close to the cart shed. They should have an entrance from the road for the horses to enter and if possible an entrance into the yard for the manure to be thrown out.

The cart and implement sheds should not face a position where the sun and driving rain will damage the paint and warp and crack the shafts. From east through north to north-west is the best range of aspect.

Where a silo is to be included as a permanent structure it should be an adjunct to the food department and be placed on the north range. On dairy farms the piggeries should be kept separate and apart from the main block of buildings.

On hill farms where the main stock is sheep, there will be several field houses and beyond these the main consideration will be the farm house and stables.

Space does not permit a description of the lay-out of the other types of farm buildings but the general arrangement is the same except in the case of purely dairy farms. If the dairy is not part of the farm house it should be placed beyond the reach of any sort of contamination.

BIBLIOGRAPHY.—For a more detailed treatment of the subject reference may be made to the following works:—A. D. Clarke, *Modern Farm Buildings* (1899); S. Taylor, *Modern Homesteads* (1905); C. P. Lawrence, *Economic Farm Buildings* (1919); W. A. Foster and D. G.

Carter, *Farm Buildings* (1922); J. C. Morton, *A cyclopaedia of agriculture*, vol. 1, and articles in the *Journal of the Ministry of Agriculture*, vols. 29, 30, and in the *Cyclopaedia of American Agriculture*, vol. 1. (A. H. H.)

United States.—Owing to the variety of types of farming, kind and quantity of stock or crops raised, economic conditions, topography, climate and other local influences there exists a considerable variation in the design, equipment and grouping of buildings, even within a single State. For this reason only very general principles can be applied to the grouping of farm buildings; each farm constitutes a specific problem that must be worked out in the light of the existing conditions and particular requirements.

The cost of farm buildings, particularly dairy barns, is such that the farmer has difficulty in obtaining an adequate return on his investment. This has led to efforts to simplify and standardize farm building design. The ultimate aims in farm structures are economic durability; economy of materials and labour in construction; arrangement and equipment to conserve time and labour in the performance of operations; and the maintenance of conditions, such as temperature, humidity, light and ventilation, which may be most conducive to the welfare of stock and the preservation of stored crops.

For comprehensive discussion of the various structures and their grouping reference should be made to the publications of the U.S. Department of Agriculture and to *Agricultural Engineering* published by the American Society of Agricultural Engineers.

FARM COLONY. An artificial settlement of unemployed persons on the land. Farm colonies are relatively little known in Great Britain, but they have been in existence in Germany for 45 years and in Holland for over 90 years. It was the Unemployed Workman's Act of 1905 which created the possibility of such an experiment in Great Britain. A feeling had grown up amongst social and land reformers that the question of the land and the question of the unemployed were closely bound together, and therefore to several classes of the unemployed, especially the unskilled, almost the only resource was work on the land offering at least a chance of productive and useful employment.

There can be no doubt about the numbers of the unemployed or the need for better cultivation of the soil, but the problem is not so easy of solution even though we have waste labour and waste land, for often the waste labour is the wrong kind of labour for agricultural purposes and very frequently the waste land costs too much to bring into cultivation. There are various types of farm and labour colonies some of which are really outside the scope of this article, such as penal colonies for the unemployable. There is for example the colony of Merxplas near Antwerp and two other colonies in Belgium designed to stamp out mendicity. Merxplas alone has 4,500 men, and with the other two colonies at Wortel and Hoogstraten possesses about 3,000 acres of land. There is a similar system in Holland, where there are three Government colonies which may be described as penal settlements for beggars and tramps.

A farm colony is really designed for the unskilled unemployed. As long ago as 1894 an experiment was made at a farm at Laindon in Essex by the Poplar Board of Guardians assisted by the late Joseph Fels. This followed the experiment in 1893 in connection with the Salvation Army colony at Hadleigh, Essex, which is still in existence, but is now more a training farm for boys who are sent abroad to the overseas Dominions. About 200 boys at a time between the ages of 14 and 19 were in 1928 being trained in this farm colony and at times there were in addition some 70 or 80 unemployed men who are being trained for agricultural work and for emigration. Another farm colony was purchased in 1928 by the Salvation Army in the vicinity of St. Albans. The Hadleigh colony has an area of 3,000 acres. It is four miles from Southend. The land is a stiff clay, rather cold and poor in character. It has however immensely improved in value. About a hundred acres are planted with fruit trees and with it are pasture land, market gardens and chicken farms. Hadleigh is not a very great loss to the Salvation Army and indirectly it is of immense value in the training of boys for overseas work.

In Germany there are something like 30 colonies which were

founded under the auspices of the German Labour colony central board for the unskilled unemployed. These colonies were and are run by philanthropy, but subsidised by the provincial governments. The first was started in Oct. 1888 on the initiative of Pastor von Bodelschwingh. These farm colonies are run on religious lines but all unemployed men able to work are admitted without distinction of character or religion so long as there is room. The only form of punishment is dismissal; colonists dismissed for bad behaviour cannot be admitted into another colony without the consent of the colony which discharged them. About 50% are men of good character but in need of training. Perhaps the best German farm colony is that at Lulerheim which has created out of somewhat unpromising material in the shape both of waste land and waste labour a very successful labour colony. The buildings themselves have been constructed in the main by the colonists with a little paid assistance.

Perhaps it is to Holland that we ought to look for the best type of farm colony for the unemployed. The most famous example is that at Frederiksoord situated in Vriesland, north-east of the Zuyder Zee and about 9m. from Steenwyck. It is one of three, the other two being Willemsoord and Wilhelminasoord. These colonies consist of 10,000 acres of heath and sand which have been brought under cultivation by townbred unemployed men, many of them over 40 years of age. They are sent from the town by the Society of Beneficence. Frederiksoord has a population of between 1,000 and 2,000 and the work is chiefly agricultural although it does include dairying, brick making and other trades. These colonies receive married men with their families as well as unmarried men and if the man has a wife and children and is accepted in one of these colonies he is usually housed in a separate cottage with a garden and the younger children are sent to a Government school on the colony. A specialty is made of horticulture in which there is excellent tuition and the gardens are a good illustration of what can be done by unskilled labour even on poor soil. There are large farms in connection with the colonies and men serve a probation upon the farms, but where a colonist has demonstrated his ability to learn the industry of agriculture he is given after a probation of two years a free farm of about 7½ acres. Two years is the shortest possible period of probation.

It seems safe to say that farm colonies in England will not succeed without Government assistance and that side by side with such colonies there should be set up market gardens and rural industries developed upon co-operative lines. In the main, however, these colonies should serve as training schools for men who wish to become agriculturalists in such countries as Canada or New Zealand. In that case a loss per head is expected but the reward comes in the creation of the right kind of emigrant for the overseas Dominions.

(P. A.)

In the United States this phrase is used to indicate a group of farmers living in the same region and co-operating in some manner. The best examples of such colonies are the groups of settlers on the arid and semi-arid lands of Western States who are banded together for the irrigation of otherwise unproductive land. Individual settlers, with the limited means at their disposal, were unable to build the large canals and irrigation structures necessary. This led to organizations of more or less compact units as water users associations or irrigation districts for financing the construction and operation of irrigation works. Under the costlier Federal and irrigation district developments colonization methods have become more important. The larger the number of people grouped together, the more necessary it is to have arrangements for marketing and programmes of cultivation. The 24 operating projects under the Bureau of Reclamation, Department of the Interior, have a population of more than 140,000 on 38,100 irrigated farms, and the 204 project cities and towns have an additional population of 390,200.

FARMER, JOHN (fl. 1591-1601), English madrigalist, of whose life little is known. He was living in London in 1599 when he published his *First Set of English Madrigals to Four Voices*, "newly composed by John Farmer," and for four years before that time he was organist at Dublin cathedral. He also set to music the thirteen canticles and hymns prefixed to the psalms

(and five of the psalms themselves) in *The Whole Book of Psalms* (Thomas East, 1592).

FARMER, RICHARD (1735-1797), Shakespearian commentator, the son of a maltster, was born at Leicester and educated at the local grammar school and at Emmanuel college, Cambridge. He graduated in 1757, became classical tutor, and in 1775 master of his college. In 1788 he became a canon at St. Paul's. In 1766 he published his famous *Essay on the Learning of Shakespeare*, maintaining that the poet's acquaintance with ancient and modern Continental literature was exclusively derived from translations, of which he copied even the blunders. "Shakespeare," he said, "wanted not the stilts of language to raise him above all other men." Farmer was immensely popular in his own college, and loved, it was said, above all other things, old port, old clothes and old books.

FARMERS' CLUBS. One of the effects of the general outbreak of agricultural enthusiasm in England at the end of the 18th century was the formation of associations throughout the country for the promotion of improvements in farming. For the most part these were societies which made the holding of an annual show of livestock their primary object. Later on, in the early part of the 19th century, another form of association became popular. Farmers' clubs were established, their main object being to hold meetings for the discussion of questions of agricultural interest, chiefly those relating to the practice of farming. In those days no gathering of farmers—or indeed of any class—for any purpose involving prolonged attendance was conceivable unless a substantial meal formed part of the proceedings. It is indeed probable that the idea of Farmers' clubs originated in the "market ordinary." In the old leisurely times the farmers of a district who met week after week round the dinner table of the favoured inn would naturally discuss farming and these discussions might in some cases take a more or less orderly and formal course.

That Farmers' clubs may have originated in some such way is suggested by the Faversham Farmers' club which was started in 1727 and still survives. This is frankly a dining club with a very limited membership and there does not appear to have been at any time any provision for discussion in its rules which were concerned only with the regulation of the dinner. The meal started at 2 o'clock and members were directed by the rules not to stay later than 8 o'clock in winter or 9 o'clock in summer. It may be assumed that during this 6 or 7 hours the members discussed, informally, farming questions. It was during the second quarter of the 19th century that the formation of Farmers' clubs became general. One of the earliest was the West Herefordshire club formed in 1839. Others were formed about the same date at Harlesden (Norfolk), Ipswich and Probus (Cornwall). In 1847 it was stated that there were then 170 Farmers' clubs in the country.

The London Farmers' club was founded in 1842. It was intended to provide a club house in London where members might meet to discuss agricultural questions and where also farmers visiting the metropolis might find the ordinary facilities and amenities of a social club. It first had quarters in the York hotel, Bridge street, Blackfriars, but in 1863 these had to be somewhat suddenly vacated as the hotel was acquired and pulled down to make a site for Ludgate Hill station. At that time the Salisbury Square hotel was about to be built and many members of the club took shares, it being hoped to secure a controlling interest. The intention was expressed in the name of the Company which built the hotel, it being called "The Agricultural Hotel Company, Ltd." The club never acquired control but accommodation for it was provided and in 1865 it took up its quarters there, remaining however then only ten years, but returning in 1886. In May 1903, the club removed to its present rooms at Whitehall court.

Whether as the result of these repeated removals or for other reasons the club for many years led a somewhat precarious existence with only a limited membership. In recent years it has steadily grown in membership and influence and has now nearly 1,500 members. But throughout its career the Farmers' club has maintained a high reputation for the papers read at its meetings.

They included subjects of timely interest dealing mainly with the practice, science and economics of farming. Among the subjects recently discussed have been "Intensified Grazing," "Open air Dairying," "Three times Milking," "Consumers' requirements for meat and how Farmers can supply them," "Modern Swine husbandry," "Farm Valuations," "The Liming of land," etc. In its earlier days questions coming within the scope of agricultural politics were more often considered by the club. The subject of tenant right frequently engaged its attention, being discussed about a score of times in the first half century of its existence. As long ago as 1847 a deputation from the club waited on Lord John Russell to urge "the necessity of some legislative enactment for the establishment of a general system of tenant right." When, 30 years later, the first legislation was passed on the subject the club strongly protested against its permissive character. On the disastrous outbreak of cattle plague in 1865-66 the club took vigorous action to impress on the Government the urgency of taking effective measures to suppress it.

Local Farmers' clubs differed widely in size and importance. In some cases their activities were confined to holding periodical meetings, usually once a month during the winter, but in many cases a room was engaged at an inn in the market town for the exclusive use of members on market days. Comparatively few attempted, like the London Farmers' Club, to provide a room or rooms for the use of members at all times. This type of club was practicable only when its centre was in a large town and it drew a part of its membership at least from the town and its immediate vicinity.

(R. H. R.)

United States.—Numerous local or State agricultural societies were founded in the United States in the late 18th and early 19th centuries, established, largely, by city professional men to improve farming practices. Such of those as survived came under the control of actual farmers. In the latter half of the 19th century various national farmers' societies were formed and attained a large membership (*see* AGRICULTURAL SOCIETIES AND SHOWS).

Chiefly since 1900, many local farmers' clubs have been formed. Some of these exist for local co-operative action in purchasing, cow testing, and other activities, but most of them are social and educational. Some conduct programmes with discussions of agriculture. The wide circulation of farm periodicals, the extension work conducted by the Government, and the existence of numerous organizations dealing with production matters cause most of these clubs, however, to lay stress rather on marketing problems, on current events of special agricultural interest, and, most extensively of all, on community improvement. Dramatic, musical, motion picture and literary programmes are given. There are occasional lectures by visiting speakers. A number of such community clubs have carried out successful movements for the erection of clubhouses for community purposes. Local branches of various farm organizations, especially the Grange, perform in some communities many of the functions of local farmers' clubs.

Among clubs covering a wider territory the Saddle and Sirloin Club is most conspicuous. Founded in 1903, it comprises in its membership leaders in various branches of the livestock industry. Membership is by invitation. The club has quarters in the Stock Yard Inn, Chicago, where it maintains a livestock library and a portrait gallery of leaders in the industry. It conducts essay contests for students in agricultural colleges and has stimulated the formation of clubs composed of students interested in animal husbandry.

Many organizations devoted to various breeds of livestock are known as clubs, such as the American Jersey Cattle, the American Yorkshire, and the American Plymouth Rock clubs. These, however, are essentially societies or associations, rather than clubs in the sense in which the word is commonly used.

A number of farm women's clubs also exist. Some of these are affiliated with the National Federation of Women's Clubs, while in some States they have federations of their own. In Ohio more than 100 are thus federated. The programmes of farm women's clubs differ little from those of women's clubs generally. In many rural villages membership of the women's clubs is made up in part of farm women, in part of women residing in town.

Farm boys' and girls' clubs exist chiefly for recreation or for carrying out specific projects such as crop growing, livestock raising, canning and garden making. The development of the latter type of club, partly under private auspices, partly under government encouragement, constitutes a striking phenomenon. The number of farm boys and girls enrolled in such organizations is (1928) more than 600,000. In many instances these clubs have stimulated their communities to improved agricultural and domestic practices.

(N. A. C.)
FARMERS' EDUCATIONAL AND CO-OPERATIVE UNION OF AMERICA, commonly known simply as the Farmers' Union, a society of farmers founded in 1902 by Newt Gresham of Emory, Texas. It was at first confined to Rains county, Texas. Its success there in collective bargaining in connection with cotton led to rapid expansion, especially in the South, the Middle West and the Far West. It never reached New England or the Middle States. Many of the local unions were formed from still existing community branches of the defunct Farmers' Alliance, which had wielded considerable political and other power from 1879 to 1892. Co-operative enterprises of great number and variety were started. Many of these soon disappeared, but others were and still are successful. The States in which the Union is strongest—Oklahoma, Iowa, Kansas and Nebraska—are those in which its co-operative programme is most effectively carried out. The Union advocates liberal political and economic policies, including direct election of the president and of Federal judges, occupational representation in Congress, opposition to militarism and prohibition of speculation in farm products. It has co-operated to some extent with organized labour. The organization is democratic, endeavouring to reach chiefly the mass of farmers rather than the leaders. The national side of the Union's work has been moulded largely by C. S. Barrett, a farmer and former teacher, who has been president of the society since 1906.

See Charles S. Barrett, *Mission, History and Times of the Farmers' Union* (1909); C. B. Fisher, *The Farmers' Union* (1920).

(N. A. C.)

FARMERS' ORGANIZATIONS. In the United States these organizations have grown to greater dimensions than in any other country, although they do not as yet occupy the place of supreme importance in agriculture that co-operation occupies in some other countries; for instance, Denmark. For similar organizations in other agricultural countries the articles thereon should be consulted. See also AGRICULTURE; AGRICULTURAL ARTICLES; AGRICULTURAL CO-OPERATION; AGRICULTURAL SOCIETIES AND SHOWS; MARKETING.

The organizations in the United States may be grouped roughly as educational organizations, improvement associations and co-operative business enterprises. In the first of these groups are the organizations which are engaged chiefly in educational work or in carrying out programmes for the betterment of the farmers' social or economic conditions or both. The second group of organizations includes those which the farmer has evolved to aid him in producing better crops and animals, such as seed-improvement associations and organizations for the exchange of information regarding cultural practices for crops; associations for improving the various strains of animals and for keeping registration records; cow-testing associations; and the calf and pig clubs. The largest of the groups consists of associations which the farmer has set up to assist him in handling his business transactions. This group includes more than 10,000 co-operative marketing associations, about 1,000 collective purchasing associations, about 2,000 mutual-insurance companies of various kinds and a large number of associations that furnish on a co-operative basis telephone service, electric current for light and power, water for irrigation purposes and transportation at cost.

Principal Organizations.—General farmers' organizations include the Grange, or Patrons of Husbandry, the Farmers' Educational and Co-operative Union of America, the American Farm Bureau Federation, the National Board of Farm Organizations and many others formed on practically a country-wide basis. For details of these organizations, see the articles dealing with them.

Marketing.—The organization of farmers for business purposes has been mainly in the field of co-operative marketing. The most reliable estimates place the total annual business of co-operative marketing associations at about \$2,500,000,000. This business is conducted by approximately 12,000 associations.

The first nation-wide survey of the extent of co-operation among farmers was begun in 1913. Data for the years 1912, 1913, 1914 and 1915 were collected and tabulated. The most complete information was secured for the year 1915. Reports were received from 5,424 co-operative associations with an estimated membership of 651,186 and an estimated volume of business amounting to \$635,838,684. The largest volume of business, \$289,689,200, was credited to the farmers' grain elevators. Fruit and vegetable associations with \$201,542,600 were second, and associations marketing dairy products were third with \$89,061,300. The second survey was made in connection with the taking of the 1919 census. Sales through farmers' marketing organizations at this time were reported as \$721,983,639, and 511,383 farms reported sales through such organizations. At the same time 329,449 farms reported purchases totalling \$84,615,669 through farmers' buying associations. The third survey was undertaken by the U.S. department of agriculture in 1921. Reports had been received from 10,500 associations up to 1925, and it is on these reports that the estimate of total business, already given, is based. The interesting feature of these figures as compared with those given for 1915 is the increase in the amount of business done by cotton and livestock marketing associations. In fact, large-scale co-operation in the South has developed entirely since 1920.

Local Associations.—In January, 1926, there were approximately 11,500 active local co-operative associations—independent organizations and units of federations—whose members were for the most part limited to farmers using the same shipping point. The local association is the earliest form of co-operation among farmers in the United States. It performs, as a rule, the services of a country dealer. Fruit and vegetables are assembled, packed and stored by local associations; milk is manufactured into butter and cheese; grain is bought; live stock is assembled and shipped and supplies are purchased and distributed by this type of organization. In most instances such an association handles only one commodity or a group of related commodities, such as several vegetables, or butter and eggs. Approximately 9,500 of the local associations operate independently. They sell their products to local dealers or through commission merchants in the terminal markets. In some cases they employ the services of private distributing firms, or more rarely sell direct to wholesalers.

Large-scale Associations.—About 2,000 local organizations, however, are member units of federations formed for the purpose of performing the selling services which the small independent local associations cannot handle to the best advantage. The federation is an organization in which the local units are the members and own the stock of the organization, if it is incorporated with capital stock. More than 450 creameries in Minnesota, for example, have affiliated to form a federation to sell the butter manufactured by them. Two hundred local citrus-packing associations in California sell their products through a co-operative central agency which they own and control. In this manner the group of local units is adequately represented in the markets at a reasonable cost. Approximately 50 federations were in operation in 1925. The annual sales aggregated \$400,000,000, and more than 220,000 farmers were members of the local units that affiliated to form these federations.

A third type of co-operative organization is the centralized regional association. The first co-operative organization of this type was formed in 1912. Since 1920, associations for the marketing of tobacco, cotton, fluid milk and dried fruit have been formed according to the centralized plan. A centralized regional association usually extends over a large area, frequently an entire State, or a producing region including portions of several States. It combines the functions of the independent local association and the federation. All members affiliate directly with the organization. It owns the local warehouses and other necessary local facilities, and performs the local functions of assem-

bling, storing, grading or processing the product in addition to the marketing functions of distributing and selling. About 75 associations of this kind have been formed. Their total sales in 1925 were approximately \$600,000,000. It will be noted, therefore, that approximately one-third of the co-operative marketing business was carried on in 1925 by 125 centralized regional and federated regional organizations. Sales agencies for the co-operative handling of live stock have been established at 19 of the terminal markets. During 1927 these agencies received live stock which sold for more than \$267,000,000. Co-operative terminal market agencies have also been formed in a few markets for the sale of grain.

Capper-Volstead Act.—The rapid growth of large-scale co-operative organizations, which began in 1920, created a demand for State laws providing for the incorporation of the co-operative associations. In 1927, 47 of the States had laws permitting co-operative organizations to incorporate, with or without capital stock, and to incorporate in their articles of incorporation and by-laws provisions that would ensure the co-operative nature of the enterprises. Many of these laws also define the status of co-operative associations with reference to State anti-trust laws. In 1922 Congress enacted the Capper-Volstead Act which, in effect, sets forth the right of producers of agricultural products to act together in associations, and prescribes certain conditions which organizations of agricultural producers must meet in order to be considered co-operative for the purposes of the act. The second section of the Capper-Volstead Act provides that the secretary of agriculture may take steps to prevent the undue enhancement of prices of agricultural products by co-operative organizations.

Co-operative Marketing Act.—Research, educational and service work with farmers' co-operative associations became a specific Government activity through the Co-operative Marketing Act, approved July 2, 1926. The act provided for the establishment of the division of co-operative marketing in the bureau of agricultural economics, department of agriculture, and for enlargement of the department's research, educational and service work relating to co-operative marketing of agricultural products, co-operative purchasing of farm supplies, and other co-operative activities among farmers.

The steady growth of co-operative marketing among farmers in the United States indicates that it has become established as a permanent method of marketing farm products. Since 1924 the development of new co-operative enterprises has been comparatively slow. More effort is being directed toward strengthening existing organizations and introducing more efficient methods of marketing farm products.

FARM (STATIONARY) MACHINERY. The machines to be described here are installed in buildings on the farm and are used mainly in connection with the preparation of foodstuffs for livestock. They may be operated by hand or power. In the latter case some form of *transmission machinery* must be employed to enable the power unit (steam or oil engine, agricultural tractor or electric motor) to drive the machinery. Where only one machine is used this is driven direct by a belt from the engine, but where a number of machines are installed it is usual to employ shafting and secondary pulleys (*i.e.*, belt wheels) for driving each machine. When several machines are to be operated simultaneously, the drive from the engine is taken by a belt to the shafting which carries the pulleys and belts for operating the various machines. Fast and loose pulleys are usually employed side by side so that by moving the belt from one to the other on the shaft a particular

machine may be started or stopped without interfering with the operation of other machines. In some cases clutches may be used instead of fast and loose pulley. Stationary machines must be driven at the correct speed as specified by the makers, if efficient service is to be secured, and care must be taken to see that pulleys of the correct size are used.

Chaff Cutters.—The chaffing or chopping of hay and straw into short lengths is done to facilitate mixing with other food-

stuffs and to assist the feeding of livestock. In a modern chaff-cutter the hay or straw is fed into a trough, at the bottom of which is a moving belt for conveying the uncut fodder to toothed rollers: these rollers hold the long stalks while the knives descend and cut the fodder into the required lengths. The knives which may be convex, concave or straight are usually attached to the spokes of the flywheel (which is connected to the driving mechanism by a spindle or shaft), and so set that they cut the fodder against the mouth of the machine as it is pushed forward by the feeding rollers, which are driven by gearing from the driving shaft of the machine. The length of cut is varied by adjusting the feeding-trough: the speed of the knives can be varied to suit the cut, and some machines have three-speed gearing for this purpose. The upper feeding roller is usually kept in position by a spring so that it can adjust itself to deal with uneven thicknesses of fodder. Power-driven chaff cutters are required in Great Britain to have a cover over the knives and to have a device to prevent the hand or arm of the operator being drawn into the machine. In hand-fed machines there is usually a device for reversing the direction of rotation of the feeding rollers in the event of the operator's arm being drawn along with the fodder. As an additional safeguard, idle rollers may be placed on the outside of the feeding rollers. Large machines may have dust-extractors and bagging attachments or blowers for conveying the cut fodder to a store.

Mills (Crushing, Grinding, Kibbling).—These machines are used principally for milling cereals, maize, pulse, etc., before feeding to livestock, so as to aid digestion, as, for example, in the case of crushed oats, or to facilitate mixing with other fodder, *e.g.*, ground corn or chaffed hay or straw. The degree of grinding is very coarse compared with flour, though some mills used by farmers can grind wheat sufficiently fine for making whole-meal bread. In America the machines described below are known as "feed-grinders" or "feed-mills" and may have attachments for cutting

pea-vines, peanut-hay and other roughage which is afterwards ground. Such machines are often fitted with bagging or blowing devices. *Crushers* or *kibblers* are used mainly for oats, maize and linseed, which are bruised, broken or flattened without being ground into a meal. The essential components are two roughened or fluted rollers which crush the corn as it passes between them. One roller is fixed and the other adjustable so that different grain can be crushed or the fineness of crushing varied. In some machines the fixed roller has a much larger diameter than the other and serves as a flywheel. The grain is fed from a hopper by gravity and the machine may be either hand- or power-driven. *Grist* or *grinding mills* are invariably power-driven and utilise small disks (smooth, rough or fluted) revolving at a high speed in a vertical plane for grinding the corn which is fed from a hopper. The mill is placed on a suitable stand and must be firmly fixed to a solid foundation. Stone was originally used for the grinding disks, but chilled metal and artificial or composition stones are now commonly employed. The disks may be flat or conical in shape and provision is made for adjusting them to vary the fineness of grinding. Where a farmer desires to grind whole-meal flour the mill may be provided with a meal-sifter. Combined crushing and grinding mills are also made: the essential components resemble those described above, but the hopper is usually divided into two compartments so that both operations may be carried on simultaneously.

Cake Breakers.—These machines are made for hand and power operation. They consist of a feeding slot and one or two pairs of toothed or spiked metal rollers which break the cake as it passes between them. The distance between the rollers can be varied to alter the size of the broken pieces: these are passed over a riddle in order to separate the meal and fine particles from the nuts. The breaking rollers should be securely protected or covered so that there is no possibility of the man feeding the machine being trapped by them, and any cog wheels used for driving the rollers should be encased by a metal covering.

Root Cleaners, Cutters and Pulpers.—These machines are used mainly for swede turnips which are hard. Mangolds and white or soft turnips are usually fed whole, though they may occasionally be sliced. *Cleaners* consist of a number of iron bars joined together in the form of an open cylinder which can rotate in an inclined plane. The roots are fed into a hopper at one end and pass by gravitation along the cleaner as it rotates into the cutter or pulper, any loose soil falling through the iron bars in the process. The rate of cleaning is regulated by altering the inclination of the cylinder to the horizontal. *Cutters* or *pulpers* are of various types and may be operated by hand or power. The simplest hand machine is the *stamp* or *lever* cutter which slices the roots by means of a receptacle with knives set in echelon at the sides and a hinged handle with a block of wood for pressing the roots between the knives. The commonest types work on the rotary principle and have a hollow barrel or drum carrying cutting devices of various shapes on the periphery. The roots are fed from a hopper and the barrel, which is mounted on a frame, can rotate in both directions so that the roots can be sliced by one set of knives and cut into fingers by the other. It is usual to slice roots for cattle and cut them into fingers for sheep. For *pulping* roots, rotating disks with cutting projections are used, but these machines appear to be going out of use. Power root-cutters may have an elevator for feeding the roots or for disposing of the roots after cutting.

Fencing of Machinery.—There are no general statutory requirements for the protection of farm-workers as there are for the protection of factory-workers. Manufacturers make it a rule to provide guards for dangerous machinery, but many precautions must, of necessity, be left to the user. All flywheels, pulleys, belts, shafting, cog wheels, etc., which are within reach of the workers should be securely fenced or protected in order to prevent accidents. Many accidents can be prevented by laying out the shafting and machinery in such a way as to remove the belting and moving-parts as far as possible from the workmen.

FARM MANAGEMENT. This subject is considered in this article solely in its relation to the farmer as a business man. The scientific production of crops and livestock products is considered elsewhere in these pages.

Farming is a one-man business in the sense that it is carried on entirely by relatively small capitalists; there is no joint-stock enterprise in British agriculture. In this respect the farmer as a business man has lagged behind his brother in urban industry. The village craft has given place to the factory or the foundry with all the opportunities presented by large scale organization for mass production, specialization of labour and scientific management of every kind. The farm regarded as a unit of production remains practically what it has always been, with only such modifications as have been introduced by the partial change from self-sufficing agriculture to production in a greater degree for the market. This failure on the part of the farmer to participate in what has come to be regarded as progress in industry can hardly be charged against him as evidence of want of imagination or organizing ability. There is probably something inherent in agriculture, as practised in this country, which makes it a one-man business. Production from the land is carried on under conditions which change from day to day and from season to season, so that departmentalization of production and specialization of labour, which are characteristic features of large scale enterprise, are impossible. A man cannot be set to drill wheat all the year in the way that a man can be set to fit tyres to the wheels of motor-cars, for wheat sowing lasts for but a short time in the year. Even during that period the work may be interrupted by conditions of the weather, and though the contrast is less sharply marked in the case of workmen engaged entirely in the care of livestock, it is true to say that owing to the dovetailing and interdependence of the various departments of the farm and the rapid decisions as to the work of the employees which is called for, specialization of management may be as difficult as specialization of labour, and the size of the farming unit must be determined by the limitations of the individual manager.

It should be noted that these conclusions are drawn from the study of farming as it is and as it always must be in many parts of Great Britain. It is not impossible to visualize conditions under which, by a completely new conception of farming, large-scale production, with its attendant advantages and difficulties, might even find its way into agriculture. If it were possible to eliminate much of the "mixed" nature of farming and to limit production over large areas to one or two commodities, on the analogy of the tea and coffee and rubber estates of tropical countries, the joint-stock system might find its place. This is a large question, outside the scope of the present article.

Farm Capital.—As regards the provision of capital for his industry the farmer's position is almost unique. Under the system of land tenure which has prevailed for the last century and a half it has been the practice for his landlord to supply the capital for what would be regarded as the factory of the industrialist, and to maintain it in tenable condition for him in return for a small annual rent. Whereas the urban manufacturer has to allocate a certain portion of his capital to the purchase of land and to the erection of the buildings necessary to his trade thereon, the farmer is provided with a factory more or less completely equipped and ready for use. This is a condition which is really essential to the one-man organization of the farming industry. The amount of capital required to buy and build the average agricultural holding and to stock it with the live and dead stock necessary would be far beyond the means of the individual capitalist, and any extensive upheaval in the old arrangement of this partnership between landlord and tenant will require either that the landlord's functions should be assumed by some other party, or that the size of holdings be reduced to the point at which the money now employed as working capital upon larger units will be sufficient to cover what we may term the fixed capital, represented by the land and buildings, in addition.

As regards working capital, the farmer is cut off from some of the sources available to other people by the relative insignificance of his business. He cannot appeal direct to the investing public.

FIG. 1.—GRAPH SHOWING DECREASE IN PERCENTAGE OF LAND DEVOTED TO CROPS FOR THE VARIOUS COUNTIES OF THE UNITED STATES DURING THE PERIOD 1919 TO 1924

Thus he is limited to his own resources and to the estimate of his credit-worthiness which the bankers and traders with whom he deals are prepared to make. This operates against him in two ways. The joint-stock banking institutions lend large sums to their agricultural customers, but farming suffers from a slow turnover (the wheat crop, for example, may require financing for two years from the date of the first ploughing until the date of delivery to market) and long-term credit makes no great appeal to the banks. This drives the farmer to the merchant from whom he buys his requisites, or to the cattle-dealer or the auctioneer from whom he buys his livestock, for the further credit he may require, and although many farmers owe much to their friends engaged in these occupations, the loss of independence which the practice entails is open to many abuses, which need hardly be enumerated. Thus in these two ways, the unsuitability of bank credit for a slow turnover, and the tying of the farmer to his merchant where merchant credit is sought, the farmer is at a disadvantage in securing access to adequate capital resources. It is true that in this respect his case is no different from that of other small manufacturers, but there is no other industry of the magnitude of farming which is comprised so exclusively of little capitalists. No satisfactory system of agricultural credit adapted to the needs of farmers in Great Britain has been devised. In the peasant countries of Europe and elsewhere credit has been organised on a co-operative basis, the members of the society assuming unlimited liability for each other. This works well enough in peasant communities, where every man's business and character is known. In England, where the small cultivator of fifty acres may have as his neighbour the tenant of a thousand-acre farm, co-operative credit on this analogy is obviously unworkable. The most promising proposal is that which contemplates the linking up of credit with farmers' co-operative trading societies. Societies for the sale of farmers' requisites on the co-operative principle are common throughout Great Britain, but both their membership and the volume of trade they do are restricted by their rules of business. These are modelled on those

of the industrial co-operative societies, under which transactions with members must be for cash only. It is obvious that there can be no advantage, and even certain danger, in extending credit to the industrial co-operator purchasing goods for consumption out of a weekly wage; it is equally obvious that there is every reason for extending credit to the agricultural co-operator purchasing the requisites and raw materials for the manufacture of his commodities, the process of which will occupy many months. So long as the agricultural co-operative supply societies insist upon cash payments, so long will their membership be a restricted one and the opportunity for solving the farmers' credit problem will not be attained.

Farm Labour.—In its relations with labour, British agriculture is in the same position as those other industries which are regulated by the decisions of a trade board. Even in the days of prosperity before the great agricultural depression of the 'eighties and 'nineties of the last century, the farming industry can only be regarded as a sweated industry, and all attempts to organize the rural worker on trade union lines failed, partly owing to the general diffusion of the agricultural population, as opposed to the concentration of the workers in urban industry, and partly owing to the decline in the demand for labour under modern systems of farming. In these circumstances, and having regard to the trend of public opinion, the setting up of an agricultural wages board sooner or later was inevitable, and wages are now regulated in every county by the decision of the impartial members of a tribunal, where the representative members are unable to agree. It is unfortunate for the farmer that the standard by which these wages are regulated must be inevitably those of the great mass of the community engaged in urban industry, whereas the competitors of the English farmer in many parts of the world are living at a lower standard. In these circumstances it is essential that everything be done to increase the efficiency of the English agricultural worker as measured by the value of his output, and it is here that some criticism of his employer may be justified. Complaints of the inefficiency of the farm labourer are general, but

there is no apprenticeship of boys, nor any organized instruction for them in farm work. They pick up what they can. As adults there is no study of their work on the lines made familiar through scientific management of industry, and too little consideration of the point at which the expense of manual labour under present day conditions becomes prohibitive and at which it is an economic necessity to multiply its efficiency by mechanical power. For a century the labourer was the farmer's cheapest machine and he has not yet fully adapted himself to new conditions.

Distribution of Farm Produce.—Thus far the British farmer has been considered as a business man solely in relation to production. The question of the distribution of his product is probably even more important at the present time. With the remuneration of his workers controlled by a wages board, and with the raw materials of his industry in the hands, for the most part, of powerful combines, there is perhaps little scope for the farmer

chants attend on regular days to purchase the farmers' corn.

The system is so convenient, so fatally easy, that its economic weaknesses are too often obscured. The object of the farmer should be to reach the consumer by the most direct route. This involves the bulking, grading and processing of his products and their ultimate distribution amongst consumers with different requirements. Take, for example, the case of fat cattle. The farmer will take his beasts, possibly one or two at a time, to the local market. Here they will be offered to a highly organized group of buyers, competition amongst whom is still further reduced by reason of their different requirements. Some will require fine quality large cattle for a hotel or restaurant trade; others prime quality small cattle for high class family trade; others again will want the inferior stock for the lowest class of industrial demand. The small quantity of stock on offer at scores of little country markets will only attract a few buyers, whose self interest in forming a "ring" is as obvious in its policy as easy in its achievement. The buyers at these small markets may be buying for their own requirements or they may be collecting stock for re-sale in the larger markets in the great consuming centres, and the wastefulness of this method of distribution needs no explanation. What is wanted is a system of farmers' abattoirs, conveniently placed all over the country, to which fat stock should be sent without entering a market at all, for slaughter, grading of carcasses, and sale direct to the retailers by grade and description. (See F. J. Prewett, *The Marketing of Farm Produce*, Part I. Livestock.)

All the movement of fat stock about Great Britain, with its attendant expense and deterioration, would be obviated in this way; butchers' rings to depress prices would be impossible; and the farmer would secure the full value of his product.

What is true of the marketing of fat cattle is equally true of other products. Take, for example, milk. Milk is produced for two purposes, namely—for consumption as liquid, and for manufacture into milk products. At the present time milk is produced in roughly equal quantities for either purpose. As regards price, it is obvious that the key to the situation lies in the control of the manufactured portion. If the producers can manufacture all that portion in excess of the requirements for liquid consumption they can control the price of liquid milk. On the other hand, if they have no organization for manufacture, and insist upon selling the whole of their production as liquid milk, leaving it to the purchaser to organize the manufacture of that portion which is surplus to requirements of liquid consumption, then it is the purchaser and not the producer who will dictate the price of milk.

Obviously what is needed in the agricultural industry is the organization of producers upon a co-operative basis for the distribution of their goods. There are many examples in various countries of what has been achieved by producers in this way. It must be noted, however, that in nearly every case these are countries farming to supply an export market, and where all the products of the land have to pass through a bottle-neck, so to speak, to reach their destination overseas. Under these circumstances the organization of producers is immensely facilitated, whereas the task in a country like Britain, where everything grown can be sold virtually at the farm gate, presents much greater difficulty. The farmer, too, is apt to be a fierce individualist, the idea of combination cuts across his notion that he can generally get the advantage in a deal, and the fact must be admitted that no society of British farmers has succeeded yet in putting up a marketing organization which can give a service of efficiency equal to that of the private trader. If British farming is to retain anything more than a semblance of prosperity it is certain that many of the farmers' business methods will have to be reconsidered and ultimately reconstructed. (See also AGRICULTURAL CO-OPERATION; AGRICULTURAL CREDIT; AGRICULTURAL ORGANIZATION; AGRICULTURAL MACHINERY.) (C. S. O.)

UNITED STATES

In the United States the organization of the farm is looked upon as an important part of the work of the farm manager. Farm organization and farm operation are therefore regarded as the two principal divisions of the subject of farm management;

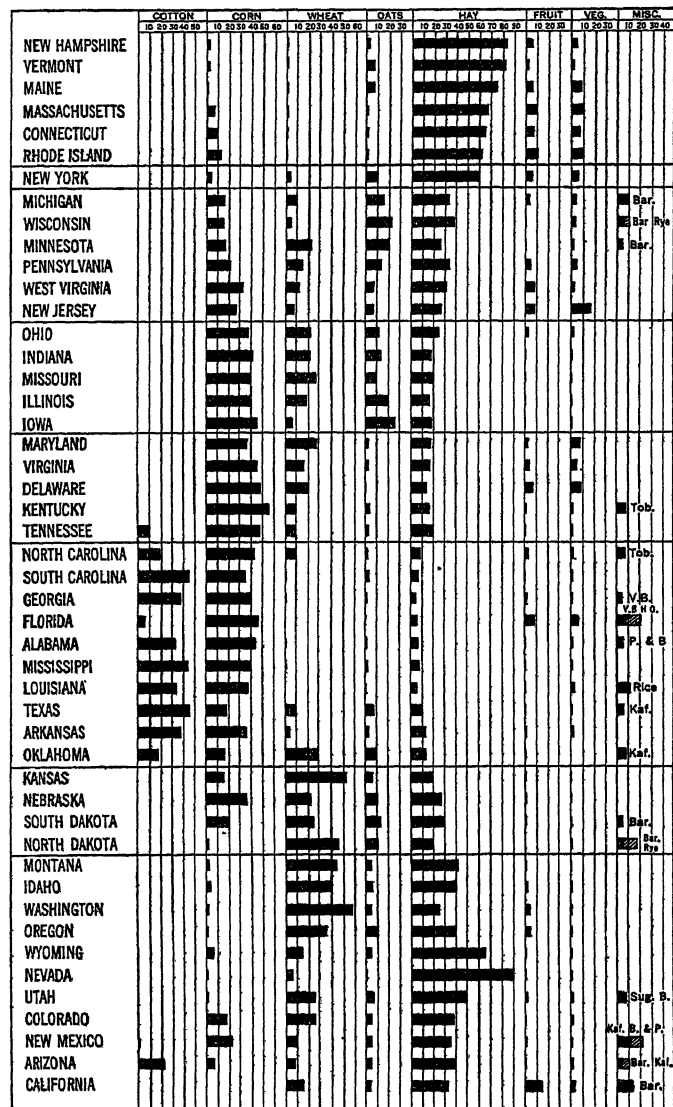

FIG. 2.—GRAPH SHOWING THE PERCENTAGE DECREASE IN CROP AREA 1919-1924, AND THE PERCENTAGE OF CROP AREA OCCUPIED IN 1919 BY CROPS NAMED

in the direction of reduced costs of production. On the other hand, he has never given serious attention to the possibility of economies in the traditional methods by which his produce reaches the consumer. The farmer has regarded himself as a producer and has been content to leave the process of distribution to be organized for him from the outside. The result has been the evolution of a chain of distributive services of extraordinary convenience to him. England is covered with a complete net-work of markets and fairs, for the sale and purchase of livestock of every description. In every town of England there is a corn exchange, or mer-

they are so presented in agricultural schools. The problems of farm organization and of farm operation overlap to a considerable extent, particularly in the matter of adjusting cropping systems and complements of livestock to changing economic conditions.

FARM ORGANIZATION

To facilitate the following discussion it may be stated at the outset that American writers on farm management generally make the following divisions of farm property:

Distribution of Farm Capital	Per cent
Fixed capital (Real Estate)	70-90
Land	27-83
Buildings (including fences)	8-48
Water supply and sometimes drainage and irrigation system
Working capital (Personal Property)	10-30
Livestock	5-23
Implements and machinery	1-5-8
Feed and supplies	1-4
Cash (or credit) for current expenses	1-2

For purposes of taxation the items listed above under the heading fixed capital are commonly termed real estate, while those listed as working capital are termed personal property.

The percentage of the farm investment in the various classes of property varies with geographic conditions and with the type of farming. The figures at the right of the table show the percentage of total investment in the various items found in twenty-five farm management surveys. The wide variation of percentage investment in buildings is due to the fact that the surveys cover a wide variety of types of farming in different sections of the country. In general, the percentage investment in buildings is small on large farms extensively operated, and large on small farms, particularly when devoted to intensive dairying. The wide variation in livestock investment is due to the same causes.

Leased Versus Owned Land.—The first problem in the organization of a farm business is whether to lease or to own the land. An important factor determining the solution of this problem is the relative income on fixed capital and working capital. In twelve American studies involving some thousands of farms, it was found that on the average fixed capital earned an income of 5.1%, while working capital earned 22.9% on the investment. It is obvious, therefore, particularly when the amount of available capital is small, that it is more advantageous to farm leased than owned land. Nevertheless, experience has shown that the great majority of American farmers invest their capital largely in land as soon as it becomes sufficient to permit a fair standard of living on owned land. There are several reasons for this. In the first place, the managerial ability of the average man is limited. A considerable capital invested as working capital would provide a business larger than the average man is capable of managing efficiently. As the capital grows, therefore, there is a strong tendency to invest a portion of it in land. In the absence of satisfactory leasing contracts that give a tenant a share in the improvements he makes, especially in the residual fertility of the soil, the renting of farm land has usually led to the deterioration of the soil, a fact which induces many farmers to own rather than to lease land.

Size of Farm.—The high wages that have prevailed in the United States since the World War have been an important factor in increasing the number of large power units and of large machines on American farms. This has made it possible for the available labour to operate more acres of land and there has been a strong tendency, especially in those parts of the country where the topography is favourable to the operation of large size machinery, for the size of the farm to increase. The advantages of large scale operation are emphasized when farming undergoes a period of depression. This is well illustrated in the accompanying map (fig. 1), which shows decrease in percentage of land devoted to crops for the various counties of the United States during the period 1919 to 1924. This was a period of severe agricultural depression. There was a very large decrease in crop area in the Ohio valley states, and in Virginia, Maryland, South Carolina,

Georgia and Missouri. The decrease was in general greatest in those sections where large scale operation is difficult because of rough topography.

There was an increase in crop area around the western end of Lake Superior and along the western margin of the Plains Area from Texas to Montana. This represents the bringing of new land into cultivation because of its cheapness. In a large area extending from East Central Texas and northward to North Dakota, then eastward through Iowa, Minnesota, southern Wisconsin and central and northern Illinois, there was very little change in the percentage of crop area. This latter region is in general one of good topography and for the most part of excellent soil. Farmers here are able to utilize large machinery to advantage, and in consequence were able to produce without loss in spite of the low prices that prevailed for their products. It is in this region particularly that a notable increase occurred in the number of large power units and large machines during this period of depression. At the same time there was a distinct increase in the size of farms in this region.

Selection of Enterprises.—The next important problem in farm organization is that of determining what crops to grow and what productive livestock to keep. The problem of what crops to grow is actually simpler than it would appear to be in view of the fact that the number of crops grown on American farms is very large. Many of these crops are limited by climatic and economic conditions to very small acreage or to restricted localities. In any one locality the number of crops that may be profitably grown is usually quite limited. In general, the crop enterprises on which a farm business is based are determined by three classes of factors, physical, biological and economic.

Physical and Biological Factors.—The physical factors are comprehended under the general terms climate, topography and soil. The most important climatic factors are rainfall, temperatures, length of growing season and liability to injurious frosts. Thus cotton is limited to the southern portion of the country by summer temperatures and the length of the growing season. Corn is limited northward by low summer temperatures and short growing season, while westward it is limited by night temperatures which are relatively low in all arid regions. Several instances are cited elsewhere in this article of the influence of topography on the choice of crops.

Biological factors are the fungous diseases and insect and other animal pests that attack growing crops. Thus wheat is excluded from warm, humid regions by rust. Flax has in the United States generally been a new land crop because of the general distribution of the disease known as flax wilt on soils that have grown flax previously. The destructiveness of the cotton boll weevil is an important factor responsible for the decrease in crop acreage in South Carolina and Georgia shown on the map referred to above. At the present time (1929) the European corn borer is causing a decrease in the acreage of corn in the northern portion of the central corn belt.

CROP ENTERPRISES

Economic Factors.—The economic factors that determine the selection of crop enterprises are numerous, the most important being the value of the product per unit of weight taken together with the cost of transportation to market. A product worth less than about 1.5 cents a pound cannot be shipped to a distant market unless consumers in the distant market can pay a high price for it. Thus the oat crop thrives best in the western mountain states. Yields are larger and the weight per bushel much greater there than elsewhere in the country; but the cost of transportation to the principal markets is very high; consequently the oat crop in the mountain states is limited practically to local needs. The commercial oat crop is produced in much less favourable territory nearer the great market centres.

Another important economic factor is competition with other regions that can produce more cheaply. For example, previous to 1890, New England farmers were engaged largely in butter production. They grow their roughage, but in general buy their concentrated feed from the West. About 1890 the northern states of the Middle West entered into butter production on a large

scale and produced more cheaply than their New England competitors. The result was a marked decrease in butter production and a large decrease in the area of land farmed in New England.

Market demand is, of course, always a factor in determining the crops to grow. There are only five crops grown in the United States for which there is a use or market demand for more than 10,000,000 acres of the product. These are cotton, corn, wheat, oats and hay, and each of them occupies more than 40 million acres of land. Together these five crops occupy 88% of the crop area. American farming is therefore based in the main on cotton, corn, wheat, oats and hay.

Transportation facilities are important economic factors, as are also the supply and character of the available labour and the adaptability of the crop to machine production. The small grain crops, such as wheat, oats and barley, have benefited more by the introduction of machinery than any others, and they occupy a large place in the farming in those sections where the topography makes large machinery feasible. Very recently large scale machinery has been made available for the cultivation of cotton and corn, and this fact is partly responsible for a recent tendency toward an increase in the acreage of these crops.

Limitations on Crop Production.—In view of the limitations imposed by the above factors the list of crops from which a selection is to be made in the case of a given farm is severely restricted. This is shown visually in the accompanying chart (fig. 2), which shows for each of the states the percentage of crop area occupied by the crops named according to the census of 1919. This chart further emphasizes the fact that cotton, corn, wheat, oats and hay occupy the lion's share of the crop area. The states are grouped in the chart according to the similarity of their agriculture. The group at the top consists of the New England States, but New York, which stands second, might very well be added to this group. It is seen at once that of the five major crops the New England farmer is very closely limited to hay. Cotton is eliminated and corn greatly restricted by climatic conditions. So far as climate is concerned wheat and oats do very well in many parts of New England. But in that section the topography is rough and the fields are small and often stony, facts which make impracticable the use of large machinery. As already stated, the small grains, such as wheat and oats, are better adapted to machine methods of handling than any other crops. This gives a tremendous advantage to the states of the Middle West, where climatic conditions are approximately as well adapted to wheat and oats as in New England, and where the topography is favourable to the use of large machinery. These crops are thus produced much more cheaply there than in New England. Because of this the New England farmer buys wheat (or flour), oats, barley and bran from the West.

Examination of the two columns headed "Fruits" and "Vegetables" in the chart shows that, with the exception of vegetables in New Jersey and fruits in California, several of the New England states have a larger proportion of their crop area in crops of this class than the other states of the Union. They are, in fact, producing about all the fruits and vegetables for which they can find a market in the relatively short season available to them.

The above facts account for the very large percentage of hay acreage in New England, in spite of the fact that the region is not as well adapted to the production of hay as the middle western and far western states. Even the production of hay could not be the basis of an extensive industry in New England were it not for the fact that the New England farmer has a very extensive market for fresh milk because of his nearness to many large cities. The cows that produce this milk require large amounts of hay.

In a similar manner the peculiarities of the agriculture of each of the remaining groups of states may be readily explained. The reader who desires to pursue the subject further will find full explanations in Farmers' Bulletin No. 1,289, issued by the United States Department of Agriculture.

A glance at the chart shows the crops that must, in the main, be the basis of farming in the various groups of states. The last column shows all crops not shown in the preceding columns and

which occupy as much as 4% of the crop area of the various states.

In the case of fruits and vegetables a relatively small acreage produces under average conditions a large return; their importance in American agriculture is considerably greater than is indicated by the chart. But the total acreage of these two classes of crops is only about 4% of the acreage of all crops in the United States. Yet the farming in many restricted areas is based almost wholly on fruits or vegetables.

Amongst the fruits, oranges are grown extensively in California and Florida, and in small areas in other states along the southern border. Lemons are confined mostly to California; peaches are grown extensively in central and southern latitudes; pears, mainly in the Pacific Coast States, while prunes and cherries are important commercial fruit crops on the Pacific Coast.

The small fruits or berries, mainly strawberries, but with some blackberries and raspberries, are grown commercially in restricted areas widely scattered over the country, mostly in central and southern latitudes. The advantages of cooperative marketing are believed to account for the increasing concentration of acreage of the berries.

The commercial production of table vegetables is largely concentrated in areas of favourable soil near cities. Several localities in the southern states grow vegetables to supply northern cities in winter and early spring.

Major Crop Areas.—In summary of what has been said about the selection of crops, attention is called to the major type of farming areas in the country. These areas are indicated by the grouping of the states in the chart. Of first importance is the great Central Corn Belt, extending from Ohio to eastern Nebraska. Corn is here the dominant crop. This is the region where the major portion of the beef cattle and hogs are fattened.

Lying to the north and northeast of the Corn Belt is a group of states in which dairying is the dominant industry, hay occupying a larger acreage than any other crop. In general, the dairy industry is well developed only in those sections of the country where it is the only generally available industry for the farmers.

In the far South lies the Cotton Belt, which extends from southern Virginia southward and westward to California. The high prices of cotton which prevailed during the World War, and part of the time subsequently, have caused an enormous westward extension of the cotton area and an important extension northward. Many millions of acres of land are still available for cotton production in the United States. The introduction of cotton on these acres awaits only a market demand sufficient to absorb the product at a satisfactory price.

Lying between the Cotton Belt and the central Corn Belt is a group of states, extending from Maryland to Kentucky and Tennessee, which may be called the South Central Corn Belt. Corn occupies a larger percentage of the crop acreage in this group of states than in any other. This is not because they are better adapted to corn than the Central Corn Belt states to the north of them; it is rather due to the fact that for the most part they lie too far north for cotton, too far south for wheat and oats, and have rainfall sufficiently heavy to make the curing of hay a precarious business. In this group of states the dairy industry has recently been advancing rapidly merely because of the absence of other satisfactory enterprises. As the demand for dairy products increases these states will probably become a more important factor in the dairy industry.

A fifth group of states lies in the Plains region to the east of the Rocky mountains. They are devoted largely to wheat production and to the range industry, with cattle and sheep. Finally, we have the great group of far western states, consisting of the three Pacific Coast states and the nine Mountain states. In most of these wheat and hay, mainly alfalfa, are the dominant crops. These states are as yet, for the most part, sparsely settled, most of the land now cultivated being under irrigation, though there are extensive tracts with sufficient rainfall to permit wheat production without irrigation. There are possibilities of great extension of agriculture in this region, particularly with the further development of irrigation projects.

Livestock Enterprises.—The principal livestock enterprises of the country are dairying, including production of market milk, and production of factory milk; beef cattle, including the raising of calves, and the fattening of beef cattle; swine, for the production of meat and lard; poultry, for eggs and meat; and sheep, for wool and lambs. The horse and mule industry was formerly important and many farmers devoted themselves largely to the raising of colts. But mechanical power is rapidly replacing horse power on American farms and the breeding of horses has become a precarious business. In all these forms of livestock farming the production of high quality breeding stock may become a principal feature of the business. About 3% of the cattle and swine of the country are recognized as belonging to the improved breeds, the other 97% consisting of various grades and crosses of the improved breeds. The purebred stock furnish the better class of farmers with breeding animals.

Market Milk.—This phase of the dairy industry is for the most part concentrated in the vicinity of cities and towns. It is a more profitable form of dairying than the production of factory milk. At the present time the dairy industry of the New England states is almost exclusively confined to the production of market milk. This phase of the industry is also found highly developed in considerable areas about such cities as Cleveland, Detroit, Chicago, St. Louis, Minneapolis and St. Paul, Seattle and Tacoma in the State of Washington; Portland, Oregon; and San Francisco and Los Angeles in California. Smaller developments are found in the vicinity of all cities.

Factory Milk.—Production of milk for sale to factories producing condensed milk, butter or cheese is the most extensive phase of the dairy industry in this country. The business is largely concentrated in the northernmost of the middle western states, where feed is cheap and where the winters are long and severe. As already explained, this form of dairying began in the last decades of the previous century to shift from the New England states to the Middle West. At present the industry is extending northwestward into the Northern Plains and Mountain States, and has long been important and increasing in the Pacific Coast States.

Raising Beef Calves.—About half the beef calves are raised on ranches in the West, the other half on farms in the Middle West, and to some extent all over the country. This is an extensive type of farming and produces low income from land devoted to it. In the Corn Belt, where many steers are fattened, farmers quite generally keep a few beef cows mainly to consume corn stalks, unsalable hay, or other waste products, and incidentally to raise calves for the fattening pens. On such farms the raising of beef calves is usually a minor enterprise. In the arid regions of the far West, where the grazing is sufficiently good for cattle, the raising of beef calves becomes a principal business.

Fattening Beef Cattle.—The fattening of beef cattle is mainly an industry of the region producing a surplus of corn. This means the Central Corn Belt. In the far West a considerable number of beef cattle are fattened on alfalfa hay alone, or in combination with grains, mostly barley and oats. In the Cotton Belt, a few cattle are fattened on cottonseed meal, the hulls of the cottonseed being fed for roughage. The fattening of beef cattle is a somewhat speculative business because of the irregular changes in the price of cattle. When the price is rising the business may be quite profitable; when it is falling heavy losses may ensue. When prices are steady, feeders usually count on the manure for their profit. An important advantage in feeding steers is that the manure is a valuable fertilizer.

Pork Production.—Swine are kept as scavengers in all parts of the country, but extensive pork production is confined mainly to the region of cheap fattening foods, especially in those parts of the Corn Belt states where the yield of corn is high. In recent years the acreage of corn and the number of hogs fattened have increased markedly in the northern Plains States. The industry may, in fact, be said to be moving in that direction.

Poultry.—Chickens are kept on farms everywhere, for the most part in flocks of 25 to 150. These small flocks find most of their living about the barn lot and in the insect and weed seeds they can find about the farm. Until about 1890, these ordinary farm flocks

produced a sufficient quantity of eggs to supply the needs of the urban population. But in the last decade of the century the growth of cities became so marked that the ordinary farm flocks no longer sufficed to supply the demand; then came the development of the commercial poultry farm. At the same time the great Middle Western portion of the country, where grains are cheap, increased the size of their poultry flocks. A continued increase in the demand for poultry products has led to extensive development of commercial poultry farming on individual farms here and there in most of the states. The major development has been in New England, New York, New Jersey, Pennsylvania, and on the Pacific Coast.

In recent years the introduction of culling has increased the profitability of the industry. The culling process consists in a careful examination of the individual hens and the discarding of those evidently not good layers. When the process was first introduced it resulted in discarding about 40% of the flocks culled, greatly to the advantage of the poultryman. The method of cross breeding for the double purpose of securing increased egg-laying ability and of distinguishing the sexes at hatching, originally suggested by Punnett, of England, and widely adopted amongst English poultrymen, has been neglected in America. Its general adoption would still further increase the profitability of the poultry industry.

Sheep.—Shortly before the beginning of the World War the supply of wool had fallen below world demand, and prices had risen to the point of considerable profit. The sheep business has remained profitable in the United States since that time except that in 1920, when the financial depression became severe, woollen mills found themselves with enough imported wool on hand to supply the decreased demand for woollen clothing for nearly a year. In consequence, American wool became unsalable. But within a year the supply of imported wool had been consumed and the price of American wool went back to its pre-war level, where it has since remained.

Goats.—Goats are unimportant except in a few localities. In southwest Texas there is a considerable area where goats are run in large numbers on the ranges. They are of some importance on farms in western Oregon and on ranges in Arizona, New Mexico and Utah. For the most part the range goats are Angoras. In the southern states, where livestock farming is little followed, the ordinary goat is quite widely kept in small numbers as a source of meat on farms. Since about 1900 several of the milk breeds of goats have received attention. They are becoming fairly common in the vicinity of cities as a source of supply of milk for infants and invalids. The most important development of this industry is in the Pacific Coast states, particularly California.

Changes in Types of Farming.—A marked change in economic conditions, as, for instance, a drop in the price of a product because of overproduction, may cause a large region to shift from one type of farming to another. Thus the high price of wheat during the war led to a 50% increase of wheat acreage in the United States. The low prices that have prevailed since the war have caused a return toward pre-war organization types. Much work is yet to be done before a full understanding can be had of the forces that control types of farming in the various sections of the country.

FARM OPERATION

In the operation of a farm business it is necessary every year to make decisions that may affect the farm organization. It is just here that the subjects of farm organization and farm operation overlap. A change in prices or the advent of an insect pest may make it desirable or even necessary to reduce the acreage of some crop or even to eliminate it entirely. In any event the operator must decide each year in advance the acreage of each crop to grow, and the numbers of livestock of the various kinds to keep during the year. Fixed rotations are not common on American farms, but in some parts of the country the crops that are grown have more or less of a fixed order. Thus, in localities where corn and the small grains are important, corn usually follows sod, or a previous corn crop; oats, sometimes wheat, follow corn, and wheat follows oats or wheat. Sod crops, usually timothy and clover (in the northern and eastern states), follow wheat. Corn may occupy the land

one or two years; oats, one year; wheat, one or two years, and the sod crop from one to several years. This elasticity in rotation makes changes in the cropping system comparatively easy. American farmers make such changes freely, usually in response to changes in the price of farm products.

Maintenance of Soil Fertility.—Much of the land in America is so new that relatively little attention has been given to the maintenance of soil fertility. Along the Atlantic coast and in those portions of the southern states where the soils were originally not highly fertile, the practice has developed of using considerable quantities of commercial fertilizers. Little else has been done with a view to maintaining soil fertility, though the subject is one of incessant study on the part of the various state experiment stations. During the present century the use of commercial fertilizers has extended westward into the Mississippi valley. Extensive tests are being conducted by experiment stations in the central part of the country to determine best practice in the use of fertilizers. In the Corn Belt States, where much livestock is kept, farmers have generally depended upon barnyard manure as a means of keeping the soil fertile. The future will undoubtedly see much change in practice in the matter of maintaining soil fertility.

Labour.—About two-thirds of the farms in the United States are family farms. This means that the labour on them is done largely by members of the farm family. On the remaining third hired labour is regularly employed. Even family farms employ hired labour at harvest time. Restriction of immigration following the World War has resulted in reducing the supply of labour, in consequence of which there has been a marked rise in wages. This has worked a hardship on American farmers, for the prices of farm products have not increased in the same ratio as the rate of wages and the cost of what the farmer has to buy. High wages have been to a marked degree responsible for the greater use of large farm machinery. The result has been a reduction in the number of labourers required on farms, and also a reduction in cost of production.

Farm Records.—Very few farmers attempt to keep even approximately complete records of their operations. On a family-sized farm it is usually possible for the operator to keep in his head the main facts of his business. Records are thus of much less value to him than they would be in the case of a large and complex business. One reason for the relatively few farmers who keep records is the fact that while it is easy enough to keep the daily record it requires considerable expert knowledge to summarize such records and make them useful. Cooperative employment of experts to keep farm records has not been as highly developed in America as it has been in certain countries of Europe. A few such cooperative organizations are in operation, particularly in Illinois, where the state experiment station has fathered the movement. The results have been very satisfactory and the movement is extending. Nevertheless, on the better conducted farms of the country one finds some kind of records kept. On some farms these records are in sufficient detail to permit a financial balance sheet to be made from them.

(W. J. S.)

FARMING THE TAXES. A method of collecting taxes indirectly through contractors instead of directly through officials of the State. The system is best known through the *publicani* of Rome, who formed companies or syndicates to farm not only the indirect taxation of the state, but also sources of the state revenues, such as mines, fisheries, etc. (see **PUBLICANT**).

In monarchical Europe, which grew out of the ruins of the

Roman empire, the revenue was almost universally farmed, but the system was gradually narrowed down until only indirect taxes became the subject of farming. France from the 16th to the 18th centuries is the most interesting modern example. Owing to the hopeless condition of its revenues, the French government was continually in a state of anticipating its resources, and was thus entirely in the hands of financiers. In 1681 the indirect taxes were farmed collectively to a single company of forty capitalists (*ferme générale*), increased to sixty in 1755, and reduced to the original number in 1780. These farmers-general were appointed by the king for six years, and paid an annual fixed sum every year in advance. The taxes which they collected were the customs (*douanes* or *traites*), the *gabelle* or salt tax, local taxes or octrois (*entrées*, etc.), and various smaller taxes. They were under the management of a controller-general, who had a central office in Paris. The office of farmer-general was the object of keen competition, notwithstanding that the successful candidates had to share a considerable part of the profits of the post with ministers, courtiers, favourites, and even the sovereign, in the shape of gifts (*croupes*) and pensions.

The rapacity of the farmers-general was proverbial, and the loss to the revenue by the system was great, while very considerable hardships were inflicted on the poorer contributors by the unscrupulous methods of collection practised by the underlings of the farmers. In addition, the unpopular nature of the taxes caused deep discontent, and the detestation in which the farmers-general were held culminated in the execution of 32 of them during the French Revolution and the sweeping away of the system.

FARM ORGANIZATION AND EQUIPMENT. The study of the organization of the farm is a comparatively recent development of modern agricultural research. In its earlier stages the investigation of the farmer's problems was confined to matters arising out of the application of the physical sciences to the production of crops and the feeding and breeding of live stock. More recently it has come to be recognized that important as this aspect of agricultural development undoubtedly is, farming is also a business, the successful conduct of which can be determined only by a study of its economic structure. The production of crops and stock is in many respects an art, but it is an art by which the farmer has to live, and maximum productivity secured by the uncontrolled application of scientific knowledge concerning the properties of feeding stuffs and manures is not always synonymous with maximum profit.

Law of Diminishing Returns.—So long ago as 1879 Sir John Lawes (*q.v.*) drew the attention of farmers to this question. He showed that there was no necessary connection between maximum production and economic production. The point at which increased production becomes unprofitable depends upon the price of the commodity, other things being equal; in a rising market this point will rise and the farmer will be justified in farming for a higher output.

An illustration of the importance of the study of organization is to be found in the comparisons which are often instituted between the intensity of farming in England and in certain Continental countries, notably Denmark. Only by the study of farm organization, both at home and abroad, can a proper interpretation be placed upon crude statistics of agricultural production, which are apt to prove dangerous weapons without it. The case of Denmark is cited as an example of what can be done to develop production from the land without the artificial stimulus applied in certain other European countries. It is pointed out that, notwithstanding a fiscal policy which admits of free imports of agricultural produce, Danish agriculture has flourished during a period in which the industry in England has been stationary; the extent of arable land, and, with this, the agricultural population, has been maintained whilst the land of England has been going back to grass to the accompaniment of an exodus of the rural population; that the yield of the soil of Denmark has steadily increased until it has reached a point considerably in excess of that of this country (see **DENMARK: Agriculture**).

In their crude form these statements appear to be justified, but a study of the organization of farming in the two countries

gives a satisfactory explanation which involves no reflection on the business acumen and technical capacity of the English farmer. The economic circumstances which give rise to the differences in agricultural progress in England and on the Continent may be classed under two heads: (a) the proportion of small farmers, and (b) the competition of urban industries. (See LAND TENURE; TARIFF.)

Size and Efficiency As a Productive Unit.—The maintenance of a high standard of production is very generally associated in Continental agriculture with farming in small units, and the advocates of the extension of the small-holding movement in this country base their case very largely on this fact. Figures collected in the course of investigations of farm organization go to show that this extra production is apparent rather than real, and that it is purchased by the expenditure of capital and labour which would be more productively employed on larger areas. Here is a table showing the manual labour and the horse labour requirements of farms in three agricultural districts, grouped by size; it will be seen that in each of them the labour required in production, whether manual or horse, varies inversely with the size of the holding, or, alternatively, that the efficiency of labour varies directly with the size of the holding:—

Size group	Persons employed per 100 acres	Draught horses employed per 100 acres
Acres	No.	No.
District 1		
Under 50	7.1	4.4
50-100	5.0	3.7
100-150	4.0	3.0
Over 150	2.4	2.5
District 2		
Under 50	7.1	5.1
50-100	6.4	3.7
100-150	4.2	3.5
150-250	3.3	2.5
Over 250	2.6	2.1
District 3		
Under 100	4.1	5.3
100-300	3.0	3.7
300-500	2.3	2.6
500-700	2.5	2.3
700-1,000	2.3	2.3

It might be argued, however, that the higher labour requirements on the smaller farms are the measure of their greater productivity, and the following table, showing the extent to which the production per unit of land and per unit of labour is affected by the size of the holding, supplies some confirmation of this. The sales per acre in the group given below (which corresponds to District No. 2 in the above table) show that the total production varies inversely with the size of the farm. The economic effect of this, however, is considerably discounted by the next column, showing the sales per person employed, when once more the greater advantage of the larger holdings is clearly indicated:—

District 2 Size group	Sales per acre			Sales per person employed		
Acres	£	s.	d.	£	s.	d.
Under 50	11	19	9	163	19	0
50-100	9	19	2	156	2	0
100-150	7	19	1	189	0	0
150-250	7	5	8	222	12	0
Over 250	8	4	4	316	19	0

In a country where alternative employment is available to an extent such as is general in Great Britain, and at higher wages than those prevailing in agriculture, it is clear that the tendency of agricultural development must be in directions which will increase the value of the unit of labour—in other words, the movement will be towards large-scale production.

To consider, now, the capitalization of the farm, evidence of the influence of size is afforded by the table below, in which is shown the value of the implement equipment, per 100 acres, on farms in three other districts. Here, again, it is apparent that the

capital cost of the implements per unit of land falls as the size of the holding increases.

District A		District B		District C	
Size Group	Value of equipment	Size Group	Value of equipment	Size Group	Value of equipment
Acres	£	Acres	£	Acres	£
Under 100	446	Under 100	374	0-49	328
101-300	286	101-180	266	50-99	294
301-500	192	181-300	212	100-149	269
501-700	164	Over 300	157	150-199	234
701-1000	173	200-299	213
..	300-499	179
..	Over 500	139

The question at once suggests itself—"What is the economic unit of production?" The answer will not be forthcoming until more work on the study of farm organization and equipment has been carried out. In some of these tables it will be observed that the rate of variation slows down as the size of the holdings increases; in fact, if curves were plotted they would rise or fall steeply through the smaller size groups and then tend to flatten out from about the 300-400 acre farm upwards. In other words there is evidence that the "economic unit" of farming in the districts used for the purposes of illustration, does not occur until this size group is reached, and that it continues for some considerable period above it. Evidence is not yet complete on the question of a top limit, but there are certain indications that one-man management does not continue its efficiency beyond a certain point. Thus, in a certain district, which contained a good many holdings extending to 1,000 acres and over, the efficiency curve rises sharply from the "under 100 acres" size group up to the "300 acres-500 acres" group, flattens out from this point up to the "500 acres-700 acres" group, and then shows a distinct tendency to fall. This is illustrated in the following table, showing the production per man employed (*i.e.*, sales less cost of raw materials) according to size of holding:—

Size group	Value of production per man employed
Acres	£
Under 100	181.1
100-300	211.6
300-500	254.2
500-700	283.2
Over 700	245.1

This result is no more than an indication of what may be expected to emerge in future work, but the point is worth studying. For American conditions, see UNITED STATES: *Agriculture*.

However, the study of farm organization according to the size of the holding gives other results besides evidence of efficiency. The next table shows the influence of size on the nature of the farmer's business. In the district chosen it is clear to what an extent dairying concerns the small farmer, while sheep raising and corn growing become intensified as the size of the farm increases. It is interesting to note that as regards meat the size has very little influence on the quantity produced, but an examination of the data shows that it is mainly pork and veal in the case of the smaller groups, and beef and mutton in the case of the larger ones.

Size group	Meat	Dairy produce*	Per acre		Potatoes	Hay	Straw
			Wool	Grain and Pulse			
Acres	lb.	lb.	lb.	lb.	lb.	lb.	lb.
Under-100	56	638	..	353	46	163	7
100-300	46	340	0.9	355	15	140	49
300-500	42	128	1.0	498	31	219	166
500-700	50	148	1.2	451	358†	202	78
700-1,000	50	72	2.0	484	25	178	110

*In terms of milk. †This high figure is due to the influence of one farm in the group which specialized entirely in potatoes.

Economic Research.—On the continent of Europe investigation has been conducted mainly by the aid of book-keeping, directed towards the determination of the cost of the main products of the farm, the capitalization of different farming systems, the rental value of the land, the labour income of the peasant and so forth. In particular, the work of Dr. Ernst Laur amongst the Swiss peasant farmers and that of Dr. O. H. Larsen, in Denmark, may be cited. In America a great development of economic study of the agricultural industry has been witnessed during the present century. About the year 1905 "farm management" became definitely a subject of study at the hands of the technical staffs of the agricultural colleges. As on the continent of Europe, book-keeping afforded the principal instrument of study, and cost investigations were conducted in most of the clearly defined crop areas. Following the formation of the American Farm Management association, a few years later, by those engaged in this work, the attention of economists as well as of agriculturalists was attracted to this subject. The number of workers in the field increased rapidly, methods of study were rapidly developed and the association was reconstituted as the American Farm Economic association (*see FARMERS' ORGANIZATIONS*).

In England, the study of farm organization and equipment on a systematic basis dates from the establishment of the Agricultural Economics Research institute in 1913, as a result of an application by the University of Oxford to the Ministry of Agriculture for a grant in aid of economic research in agriculture. As in other countries the institute started its work by the costing method, and allowing for the interruption caused by the war it has continued with it as one line of investigation ever since. Costing is, of course, only the means; it is not the end itself and it may be useful to those who have not studied the process to give a few examples illustrating the kind of information got from this rather complicated exercise.

First, there is the evidence it supplies on the efficiency of farm management in all its aspects. To take one of these for example, the use of manual labour. One object of any system of farming should be to give employment to a regular staff of men at all seasons of the year. Few systems do this better than the ordinary four-course rotation and some of the modifications of it, but many rotations make the farmer dependent to a large measure on casual seasonal labour. The results of costing show that dependence on casual seasonal labour has the effect of raising unit labour costs, and though systems of farming involving much seasonal labour are often justified on account of the usually profitable nature of the crops grown (as in the case of potatoes), it may well be that in certain cases the relative costliness of the labour involved may lead the farmer to consider whether after all it gives him an adequate return for the extra working capital and trouble involved. The introduction of silage or of the sugar beet crop into the rotation can have a very upsetting effect on labour organization, unless plentiful supplies of casual labour are available at the right seasons, and cost records are the only means by which to confirm or correct the farm-manager's general ideas of the economic value of these and other new crops.

To take, as a second example, the organization of the horse labour on the farm. It costs so much to keep a horse for the year, and on the great majority of farms the figure does not vary very appreciably. But it does not follow that there is little variation in the cost of horse labour, for the cost of a day's work depends not only on the cost of keeping the horse, but on the number of days during which it is effectively employed. Allowing for Sundays and Christmas day and for Saturday half-days, the maximum number of working days is 286 in the year, and every day less than this number worked by horses adds proportionately to the cost of the labour performed. Figures collected recently from seven farms showed that the percentage of idle days varied from 13% up to 39%, and it will be realized how seriously the cost of horse labour mounts up in proportion as the number of idle days increases. This is a typical example of the way in which costing may direct the attention of the farmer to possible weaknesses in his management. It may be simply that he has too many horses, in which case results such as these will make him consider the possibility of their

reduction. It may be that his system of cropping is such that he needs an abnormal equipment of horses at certain seasons of the year, in which case he will be led to consider whether his system is so profitable as to make the idle horses at other seasons worth while, or whether he could not modify it in some way which would enable him to keep his horses more regularly employed.

Costing and Labour Costs.—A third example of the use of costing is the compilation of comparative labour costs, to establish measures of individual efficiency in the use of manual labour. The figures in the following table, compiled by A. Bridges, represent the normal utilization of labour for crops and live stock on a series of farms in the eastern counties of England; similar figures have been published by Dr. A. G. Ruston, of Leeds, and various tests of a like character can be devised which serve as standards of efficiency for other aspects of farm management.

Average Labour Requirements of Farm Crops and Stock Arable Land

		Man days per Acre

Sheep (Arable Breeds)	.	1.29

In the absence of data such as these nothing is more baffling than the attempt to trace leakages in farm management which cannot be located by any other means and which are often most surely responsible for the difference between profit and loss in farming. In a great number of cases the partial failure of the farmer is due to faulty organization of labour or to some similar cause which defies detection by any process of inspection. As the practice extends of recording daily the operations on the farm it will be possible to establish, district by district, certain efficiency standards by which to test individual farm management. A good example of what has been done already in this direction is afforded in the case of milk-recording where, by careful observation and record, the farmer is provided with the means of weeding out the unprofitable elements in his dairy herd. The case provides an illustration of that which will be possible in many other directions when full records of the various matters arising in farm management are available, and similar weaknesses in the organization of production can be detected.

Although the costing method was thus the first line of attack on the problems of agricultural economics it was always realized that it would not be sufficient in itself, and it was suggested that valuable information could be collected by means of economic surveys of farming districts. The evidence to be got in this way is less complete than that furnished by the more intensive costing method; on the other hand, a much greater mass of it can be collected by the expenditure of an equal amount of time and energy. At the outset, these surveys were planned to deal with particular problems; thus, A. W. Ashby conducted a survey of allotments and small-holdings in Oxfordshire, as the basis for a study of the rural allotments and the small-holding problems, and similarly, J. Orr conducted surveys of the systems of farm management in the counties of Oxfordshire and Berkshire, and considered the problems arising therefrom. But this method was found to be incomplete, for although it may happen that special

problems will arise for investigation, the study of farm economics as a whole cannot best be pursued by the examination of particular questions. It was decided, therefore, to inaugurate general surveys, designed to collect all the information of any kind whatever which can be got by inquiry on the farm, for tabulation in a variety of ways, and then to study the tables in order to see what information they afforded. The method has been made familiar by the work of American farm economists. This work has formed a part of the activities of the Oxford Institute, and data have been collected from nearly 1,500 farms.

A more recent investigation undertaken by the Institute is the study of the organization of agricultural marketing. The economic weakness of the existing marketing methods has often been a subject of comment, and particular attention has been attracted to it by the report of the departmental committee on distribution and prices of agricultural produce. It was felt that it should be possible to organize an advisory service for farmers in marketing problems, in fact, that such a thing should be an essential part of the general advisory services available to them (*see AGRICULTURE; AGRICULTURAL ARTICLES; and MARKETING*).

Since 1922 arrangements have been completed by the Ministry of Agriculture for the local study of farm organization and equipment throughout England and Wales, to supplement the work carried on by the Agricultural Economics Research Institute at Oxford and with this body as a co-ordinating centre. For the purpose of advisory work of all kinds among farmers the country was mapped out, some years ago, into provinces, each of which is equipped with an advisory staff of experts in the various branches of agricultural science. These staffs have now been strengthened by the inclusion in each of an advisory economist, who is occupied with the study of farm management problems arising within his particular province. Their function is mainly to assist the farmers of their districts to greater efficiency in the control of farm management, whilst, at the same time, the information and data accumulated by them in the course of their work is available for the use of the central institute at Oxford for co-ordination and review upon a national basis.

FARM RENTS. The rent of an agricultural holding is the consideration paid for its use by the occupier to the owner. It may be paid in produce, in services or in money. Feudalism, which was for centuries the dominant agrarian system in Europe, resulted, in the end, sometimes after serious political disturbance, in the emergence of two main classes—peasant proprietors and tenant farmers. In Great Britain the manorial organization from the earliest times included a number of small occupying-owners (eventually the class of yeoman-farmers), but the great majority of the cultivators were "villeins" occupying their allotted shares in the common field on terms of service (*see LAND TENURE*).

The first stage in the development of farm rents was the definite fixing of the amount of service, *i.e.*, the number of days' labour, which the tenant was bound to render to the lord of the manor. Concurrently the practice of payment in produce instead of, or in combination with, services arose. In a typical instance cited by Thorold Rogers the rent was partly produce and partly labour—a quarter of seed wheat at Michaelmas, a peck of wheat, four bushels of oats and three hens on Nov. 12, a cock and two hens at Christmas, with the obligation to plough, sow and till an acre of the lord's land, and some other services. The only money payment was a halfpenny on Nov. 12 and a penny at every brewing.

This was in the 13th century, but a change was rapidly taking place. Landowners required money to maintain the rising standard of living and to meet the charges falling upon them. With an extending market larger and more enterprising tenants were able to sell increasing quantities of their products. The commutation of produce and service rents into money payments was in the interest of both classes and proceeded rapidly, the process being accelerated after the Black Death. By the end of the 15th century money rents were general although the old tradition was often perpetuated by still including some produce in the terms of the agreement. Even as late as the 18th century traces of produce rents were often found among the conditions of a farm lease.

Comparisons of modern rents with those paid in the middle ages have little meaning owing to the changed value of money. Soon after the beginning of the era of improved farming, in the latter part of the 18th century, Arthur Young estimated the average rent of English farms at 10/- per acre. Thereafter there came during the Napoleonic Wars a substantial rise in rents. But after Waterloo there was a collapse. Landlords were reluctant to recognise that the high prices of the war period were due to temporary causes and rents were often kept up until many farmers were ruined and large tracts of land were left untenanted. Nevertheless it is stated that by 1816 reductions of rent had amounted to a gross total of £9,000,000. The depression lasted for over 20 years, but after 1840 there was a marked recovery, and agriculture entered on a period of prosperity during which rents rose steadily until 1880.

During the next 20 years rents fell almost continuously but at the beginning of the 19th century they reached something approaching stability. The World War saw no such raising of rents as characterized the war period a century earlier, and although farmers made high profits landowners generally profited little. After the World War many estates were sold and there was some increase of rents generally especially where the land had new owners.

Average Rents: 1925.—In 1925 the Ministry of Agriculture obtained estimates, through their crop reporters, of the average rent paid in England and Wales for eight different sizes of agricultural holdings, distinguishing in each case between (1) holdings mainly arable (70% and over arable land), (2) holdings mainly pasture (70% and over pasture), (3) mixed holdings lying between these two groups, (4) fruit and vegetable farms, and (5) poultry farms.

The average rents per acre paid for holdings in each of the three chief groups are shown in the following table:—

Farm Rents

Size Groups	Mainly arable	Mainly pasture	Mixed	All kinds
Acres	s.	s.	s.	s.
1-5	51	64	56	62

The average rent of fruit and vegetable farms was 82/- per acre and of poultry farms 64/- per acre.

In comparing size groups it is to be remembered that as the rental of a farm includes not only the land but the farm house and buildings the rent per acre naturally tends to diminish as the acreage increases. (R. H. R.)

THE UNITED STATES

The history of agricultural rents in the United States of America commences with its colonial period, during which many proprietors who had received large grants of land in colonies south of New England attempted to collect quitrents from those who occupied their land. In general, the annual quitrent pay-

ments were evaded, resisted and made tardily, if at all. This failure of the quitrent system hastened the breaking up of the large land holdings. Sales were facilitated where full title passed. Except in sections of the South where plantations exist, the majority of individual landlords now own but one rented farm each, and about half of all rented farms in the country are thus owned. Cheap land or free land on which a squatter might live was so plentiful in early colonial days that unless a farm was unusually well improved or situated it had little rental value. But from early times there have always been farmers who have preferred the greater comforts and certainty of existence as tenants on improved farms of older settled neighbourhoods to pioneer life on land which they might own along the westward moving frontier.

Except as grantor of grazing permits in national forests, the Federal Government, the original owner of a large part of all lands in the United States, has never attempted to fill the rôle of landlord. The general policy of the Government has been to get the public domain into the hands of private owners as rapidly as possible. There is still much land open for occupation, but because of the marginal or sub-marginal character of this land not much of it is now passing into private ownership and it has little effect on prices and rentals paid for land already in private ownership. Permits are sold for grazing privileges in the national forests but the amount charged the stockowner is based on the kind of live stock, the number of head and the number of months' grazing, and does not concern a definite area of land rented for a definite period of time. Fees charged for permits to graze in the national forests have been adjusted upward and, when in full effect, will vary with the value of each range, averaging about 14.4 cents per month for cattle and 4.5 cents per month for sheep. Formerly a flat rate of 10.4 cents per month for cattle and 2.9 cents per month for sheep was charged for all permits on all ranges (see *Report of the secretary of agriculture*, p. 79, 1927).

Many of the States have held land and while much State land has been leased to private individuals pending sale, it has been the general policy of the States as owners of agricultural land to dispose of it by sale to individuals. The rents collected by the States have rarely been looked upon as a permanent source of income. During the 18th century agricultural writers frequently mentioned the fact that land was rented. By 1843 a correspondent to one of the farm papers says that one-fourth to one-third of the farms in a New Jersey county were rented, mostly for a share of the product. Other notes of a similar kind indicate that the practice of renting land was early established in all the older communities. Statistics on agricultural tenancy in the United States are available, beginning with the census taken in 1880. Considering as owner-operated farms those worked by part owners and managers, the farms worked by tenants were 25.6% of all farms in the United States in 1880, 28.4% in 1890, 35.3% in 1900, 37.0% in 1910, 38.1% in 1920 and 38.6% in 1925. About the same proportion of improved farm land and of land and building values is operated by tenants, but tenants work a somewhat smaller part of the farm acreage.

Farm lease contracts made for a year at a time are the rule, rather than the exception, in the United States. The average occupancy of tenant farmers is only about three years and many tenant farmers move almost every year. This affords frequent opportunity to adjust the lease contract to changing use values of farm land. Because of the large element of speculation in the value of farm lands in the United States, the prospective income from increments in value has been prevalently considered as supplementary to rentals. In many sections of the country the capitalization of expected increments has caused net rentals to appear to be a small percentage of return on capital values. Net rentals from agricultural land are much less than they were before 1914. Cash rent rose with land values up to 1920 and, like them, has fallen since that year. Share rent increased in value with the higher prices received for farm products and has fallen as the price level of agricultural products has fallen. Taxes on farm real estate rose with other things, but have not fallen to the extent that the gross incomes available for tax payments have fallen, and this circumstance has seriously reduced net rentals. An indi-

cation of the trend of gross rents in fertile areas may be found in Iowa, which is in the heart of the principal maize-producing section. Cash rent per acre for farm land in Iowa for specified years was: 1900, \$3.29; 1905, \$3.57; 1910, \$4.22; 1915, \$5.14; 1920, \$8.28; 1925, \$7.03. (Figures for 1900-15 inclusive are given in U.S. Dept. of Agr. *Bulletin 1224* and for 1920-25 are from the *U.S. Census*.)

Taxes on rented farm real estate are generally paid by the owners. The depression in agriculture, however, has caused so many farmers to turn to other ways of getting a living that much farm land is wholly unoccupied in the poorer sections, and much of the mediocre land may be leased on terms which do not return landowners a sufficient income to meet the taxes currently levied against it. In the United States more farms are worked by tenants on shares than are rented for a fixed amount payable in cash. The census of agriculture for 1925 showed 393,452 farms rented for cash and 2,069,156 farms worked by tenants, who either rented entirely on shares, or rented part of their land on shares and part for cash. An additional group of 554,842 farmers owned a part of the land they farmed and rented the rest of it from other landowners for cash or on shares. As compared with 1920, these figures reveal a comparatively large decline in cash renting and an increase in other forms of rent payment. Cash-rented farms outnumber farms occupied by other tenants only in a few agriculturally unimportant States. On most farms leased for a fixed amount of rent in cash or kind the rent to be paid in the next year is determined in the autumn, by competition for land by tenants and for tenants by landowners. This competition is largely controlled by the current prosperity of the tenant class and by the outlook for the ensuing year. In 1920, in the 16 southern States, 104,996 farms were occupied by standing renters; i.e., renters who pay a fixed amount of product, such as so many bales of cotton. Two-thirds of this class were in Georgia and South Carolina, principally in a belt of Piedmont cotton counties. In share renting the agreement varies with respect to points such as the contribution of the work, stock, equipment, fertilizer and miscellaneous expenses, as well as with regard to the share each party is to have in the proceeds. On many farms primarily leased on shares there are certain fields, pastures or perquisites for which the tenant pays cash rent. Cash rent is seldom paid on farms from which the landlord gets a share of the live stock receipts. The payment of cash rent on crop share rented farms often is to compensate the landlord for the fact that the tenant has opportunities to obtain an income from live stock kept on fields from which a crop may not be sold to advantage.

Three-tenths of the two million and more farm tenants who paid something other than cash rent for the use of land in 1925 were croppers farming in the southern part of the United States. For all practical purposes the majority of croppers may be described as married labourers without capital of their own, hired to raise a cotton crop in which they are given a half share interest in lieu of wages, and advances secured by that share interest so that they and their families may live while making the crop. Croppers constitute the major exception to the rule that in the United States farm tenants own the work animals and the farming equipment. (O. M. J.; H. A. P.)

FARM TENANTRY: see LAND TENURE: *Primitive*; LANDLORD AND TENANT; LAND TAXES, etc.

FARM VALUATIONS. The term farm valuation is frequently used in a limited sense, to describe the statement drawn up by a professional valuer of the various items for which an outgoing tenant of a farm is entitled to be paid by the incoming tenant. This is more properly termed a tenant-right valuation. It comprises all those matters for which compensation is payable under custom, agreement or statute, including the value of hay and straw left on the farm, growing crops, tillages and the unexhausted value of fertilizers and feeding stuffs. (See LAND TENURE: *Economic Aspects*.)

A farm valuation in the wider sense is analogous to the stock-taking in a factory or shop. It is a complete inventory of the live and dead stock on the holding, growing crops, and also labour expended in the preparation of the land for prospective crops. In

other words it is a statement representing, item by item, the amount of working capital sunk in the farm. It thus forms the basis of farm accounts, and it is usually made once a year at the date to which the accounts are made up. The main headings of the valuation are (1) Live stock, (2) Implements, (3) Gathered crops—corn, hay, straw, etc., (4) Growing crops, (5) Cultivations, unexhausted manures, etc.

In the case of a farmer taking a farm for the first time and consequently having to buy the whole equipment the valuation is simple. Everything is naturally entered at cost price. At the end of the year the question arises as to the basis of the valuation. A common practice among farmers is to enter the value of live stock at current market prices and similarly to enter hay, straw and corn in rick at selling value.

There has been much discussion on this subject. It is contended, on the one hand, that by taking the prices which would be realized in the open market, the amount of the capital actually invested in the farm on that date is shown. In other words by taking market prices farmers ascertain "what they are worth" at the time.

On the other hand it is argued that the object of introducing the valuation into the farm accounts for the year is to show with greater precision than is indicated by income and expenditure alone what has been the profit or loss on the year's working. If the object of the valuation were to show the amount which would be realized if the farmer were giving up farming it is agreed that current market prices must be taken. But it is evident that fluctuations in prices from one year to another would have the effect of increasing or decreasing the nominal value of live stock and produce. A simple instance will illustrate how this method of valuation works out. The selling price of hay may be £2 per ton in one year and £5 per ton in the next year. If in each year the farmer had 100 tons of hay in rick the valuation would show a fictitious profit of £300, and the balance of the year's accounts would exist only on paper and would not represent the actual facts. The correct method, it is claimed, is to value the hay as nearly as possible at its cost—*i.e.*, labour, plus rent and interest on capital.

The system of cost-accounting on the lines widely adopted in commerce has been vigorously advocated in recent years. The principle of the system is to allocate to each department of the farm the expenditure chargeable to that department with the object of ascertaining the actual cost of each item of produce. If this is done the figures entered in the valuation for crops, etc., represent the real value to the farmer at the time. In the case of breeding stock current market prices are frequently taken but if the herd or flock remains constant in number it is contended that a better plan is to take a fixed value per head. As regards machinery, implements and tools the principle of valuation is fairly clear, *viz.*, to write off from the original cost a percentage for depreciation each year. The principle, however, must be applied with discretion, as if it were strictly applied it would reduce the value of some articles to *nil* long before they were in fact worn out.

Farm valuations have long been made on more or less traditional lines and the principles on which they should be constructed form an important branch in the study of agricultural economics. At present there is no general agreement on the subject.

(R. H. R.)

FARNABY, GILES, English composer, was born in the second half of the 16th century, probably at Truro, where his family lived. He began to study music in 1580, according to his own statement in his *supplicat* (Wood; *Fasti*, ed. Bliss, i. 257) when he was taking the degree of Mus. B. at Oxford in 1592. Beyond these facts little is known of his life. His son Richard is one of the composers included in the Fitzwilliam Virginal Book. No connection has been traced between Giles and the grammarian and schoolmaster Thomas Farnaby who lived about the same time. The name of Giles Farnaby lives today chiefly in his contributions to the Fitzwilliam Virginal Book. The *Fantasia* was his favourite form, but his other pieces bearing such attractive titles as *Giles Farnaby's Dream*, *His Rest*, *His Humour*; *Up Tails*

All, A Maske, A Toye, A Gigge—are full of quaintness and charm. One tiny piece for two virginals is only 8 bars long; others, not much longer, are marvelous in their point and precision and intensely musical in feeling.

His *Canzonets to foure voices, with a song of eight parts* were published in 1598. Other works are included in Thomas Este's *Whole Booke of Psalmes* (1592) and Ravenscroft's *Psalter* (1621). The madrigal *Come, Charon, come* is in the Royal College of Music, London; another: *Construe my meaning* has been edited by W. Barclay Squire. An autograph volume of *The Psalmes of David, to fouer parts, for viols and voyce, The first Booke, Doricke Motets, The Second, Divine Canzonets, Composed by Giles Farnaby, Bachilor of Musicke with a prelude, before the Psalmes, Chromaticke* is in a private library in Philadelphia, U.S.A. See the articles "Farnaby," "Virginals," in Grove: *Dictionary of Music and Musicians*.

FARNBOROUGH, THOMAS ERSKINE MAY, BARON (1815–1886), clerk of the British House of Commons and historian, was born in London on Feb. 8, 1815, and was called to the bar at the Middle Temple in 1838. His *Treatise on the Law, Privilege, Proceedings and Usage of Parliament* (1844) is a standard work on its subject, and has itself influenced parliamentary procedure. Sir Erskine May (he received the K.C.B. in 1866) was examiner of petitions for private bills (1846), taxing master of the House of Commons (1847), assistant clerk (1856), and clerk of the House of Commons (1871–86). His *Constitutional History of England . . . 1760–1860* (1861–63) is an important work, which was revised in later editions by its author and remains a standard authority. Erskine May died in London on May 17, 1886, a few days after his elevation to the peerage.

FARNBOROUGH, an urban district in the Aldershot parliamentary division of Hampshire, England, 33½ m. S.W. by W. from London, with two stations on the Southern railway. Pop. (1931) 16,359 (including the military). The old parish church in Farnborough park has a 12th century nave and ancient timber details. Farnborough Hill was occupied by the late ex-empress Eugénie. St. Michael's Roman Catholic memorial church, erected by the ex-empress for the remains of Napoleon III. and the prince imperial, later received her own remains. An adjoining abbey is occupied by Benedictine fathers of the French congregation. Aldershot North camp is within the parish, which also includes an establishment of the Tank Corps at Pinehurst barracks, a Royal Air Force station with school of photography, and the experimental section of the Royal Aircraft establishment.

FARNE ISLANDS [also *Fearne*, *Fern* or *The Staples*], a group of rocky islands and reefs off the Northumberland coast, England. In 1921 they had only three inhabitants. They extend in a line of some 6 m. in a north-easterly direction from the coast. The Fairway, 1½ m. across, separates the largest island, Farne, or House, from the mainland. Farne is 16 ac. in area, and has precipitous basaltic cliffs up to 80 ft. in height. The other principal islets are Staple, Brownsman, North and South Wamses, Longstone and Big Harcar. On Farne is a small chapel of the 14th century, with a square tower near it built a century later for purposes of defence, in which religious services are still sometimes held. The chapel is believed to occupy the site of St. Cuthbert's hermitage, whither he retired from the priory on the neighbouring Holy Island or Lindisfarne. He was with difficulty persuaded to leave it on his elevation to the bishopric of Lindisfarne, and returned to it to die (687). Longstone lighthouse is famous as the scene of the bravery of Grace Darling in rescuing survivors of the "Forfarshire" wrecked (Sept. 6, 1838) on the Harcars. Farne lighthouse is another powerful light maintained here. The rocks abound in sea-fowl, including eider duck.

FARNESE, Italian family which ruled the duchy of Parma for two centuries. The Farnese are first heard of as lords of Farneto or Farnese, a castle near the lake of Bolsena, and they were consuls and signori of Orvieto. They seem always to have been Guelphs, and in the civil broils of Orvieto they sided with the Monaldeschi faction against the Ghibelline Filippeschi. Pietro Farnese commanded the papal armies under Paschal II. (1099–1118); another Pietro led the Florentines to victory against the Pisans in 1363. Ranuccio Farnese served Eugene IV. so well that the pope endowed him with large fiefs, and is reported to have said, "The Church is ours because Farnese has given it back to us."

Pope Alexander VI. was the lover of the beautiful Giulia Farnese, known as Giulia Bella. Her brother Alessandro, created cardinal in 1493, was elected pope as Paul III. (q.v.) in 1534. An unblushing nepotist, he alienated immense fiefs belonging to the Holy See in favour of his natural children. Of these the most famous was Pierluigi Farnese (1503-1547), who served in the papal army in various campaigns, but also took part in the sack of Rome in 1527. On his father's elevation to the papacy he was made captain-general of the Church, and received the duchy of Castro in the Maremma, besides Frascati, Nepi, Montalto and other fiefs. A shameless rake and a man of uncontrollable temper, his massacre of the people of Perugia after a rebellion in 1540 and an unspeakable outrage committed on the bishop of Fano are typical of his character. In 1545 his father conferred on him the duchy of Parma and Piacenza. He deprived the nobles of their privileges, and forced them to dwell in the towns, but to some extent he improved the conditions of the lower classes. When Pierluigi built a castle at Piacenza to overawe its inhabitants, a successful plot to murder him was organized by the marquis Anguissola and others, with the support both of Gonzaga, the imperial governor of Milan, and of Andrea Doria (q.v.), Charles's admiral, who sought revenge on Pierluigi for his part in the Fiesco conspiracy (see FIESCO). He was murdered on December 10, 1547, and Piacenza was occupied by the imperialists.

Pierluigi had several children, for all of whom Paul made generous provision. Alessandro (1520-1589), was created cardinal at the age of fourteen; he was a man of learning and artistic tastes, and lived with great splendour surrounded by scholars and artists, among whom were Annibal Caro, Paolo Giovio, Della Casa, Bembo, Vasari, etc. It was he who completed the magnificent Farnese palace in Rome. Orazio, Pierluigi's third son, was made duke of Castro when his father became duke of Parma, and married Diane, a natural daughter of Henry II. of France. Ottavio, the second son (1521-1586), married Margaret of Austria (q.v.), the natural daughter of Charles V., and widow of Alessandro de Medici, at the age of fifteen. After Pierluigi's death Paul appointed a papal legate to Parma; Ottavio pushed his claims; but did not receive the duchy until the accession of pope Julius III. (1551). This did not end his quarrel with the emperor, for Gonzaga refused to give up Piacenza and even threatened to occupy Parma, so that Ottavio was driven into the arms of France. Julius, who was anxious to be on good terms with Charles, ordered Farnese to hand Parma over to the papal authorities once more, and on his refusal deprived him of his Roman fiefs, while Charles did the same with regard to those in Lombardy. A French army came to protect Parma, war broke out, and Gonzaga at once laid siege to the city. But the duke came to an arrangement with his father-in-law, by which he regained Piacenza and his other fiefs. The rest of his life was spent quietly at home, where the moderation and wisdom of his rule won for him the affection of his people. At his death in 1586 he was succeeded by his son Alessandro Farnese (q.v.) (1545-1592), the famous general of Philip II. of Spain, who spent the whole of his reign in the Flemish wars.

His son and successor, Ranuccio I. (1569-1622), was a reserved and gloomy bigot; he instituted savage persecutions against supposed witches and heretics, and lived in perpetual terror of plots. His eldest son Alessandro being deaf and dumb, the succession devolved on his second son Odoardo (1612-1646), who fought on the French side in the war against Spain. His failure to pay the interest of the money borrowed in Rome, and the desire of Urban VIII. to obtain Castro for his relatives the Barberini (q.v.), resulted in a war between that pope and Odoardo. His son and successor Ranuccio II. (1630-1694) also had a war with the Holy See about Castro, which was eventually razed to the ground. His son Francesco Maria (1678-1727) suffered from the wars between Spain and Austria, the latter's troops devastating his territory. The succession devolved, at his death, on his brother Antonio (1679-1731), with whom the male line ended. The powers had agreed that at the death of the latter the duchy should pass to Don Carlos of Bourbon, son of King Philip V. of Spain by Elisabetha Farnese (1692-1766), granddaughter of Ranuccio II.

The Palazzo Farnese in Rome, one of the finest specimens of

Roman Renaissance architecture, was begun under Paul III., while he was cardinal, by Antonio da San Gallo, and completed by his nephew Cardinal Alessandro under the direction of Michelangelo (1526). It was inherited by Don Carlos, afterwards king of Naples and Spain, and most of the pictures were removed to Naples. It now contains the French embassy to the Italian court, as well as the French school of Rome.

BIBLIOGRAPHY.—F. Odorici gives a detailed history of the family in P. Litta's *Famiglie celebri italiane*, vol. x. (Milan, 1868), to which an elaborate bibliography is appended, including manuscript sources; a more recent bibliography is S. Lottici and G. Sitti, *Bibliografia generale per la storia parmense* (Parma, 1904); much information will be found in A. von Reumont's *Geschichte der Stadt Rom*, vol. iii. (1868), and in F. Gregorovius's *Geschichte der Stadt Rom* (Stuttgart, 1872).

FARNESE, ALEXANDER (1545-1592), duke of Parma, general, statesman and diplomatist, governor-general of the Netherlands under Philip II. of Spain, was born at Rome on Aug. 27, 1545, and died at the abbey of St. Waast, near Arras, on Dec. 3, 1592. He was the son of Ottavio Farnese, duke of Parma, and Margaret of Austria, natural daughter of Charles V. He accompanied his mother to Brussels when she was appointed governor of the Netherlands, and in 1565 his marriage with the princess Maria of Portugal was celebrated in Brussels with great splendour. Alexander Farnese had been brought up in Spain with his cousin, the ill-fated Don Carlos, and his uncle Don John of Austria, and after his marriage lived at the court of Madrid. He fought under the command of Don John in 1571 at Lepanto. In the autumn of 1577 Farnese was sent with reinforcements to Don John of Austria, governor-general of the Netherlands, and it was mainly his prompt decision at a critical moment that won the battle of Gemblours (1578). Shortly afterwards Don John died, and Farnese was appointed to take his place.

In military ability Farnese was inferior to none of his contemporaries, as a skilful diplomatist he was the match even of William the Silent, and he was untroubled by scruples. He fomented the divisions and jealousies between Catholic and Protestant, Fleming and Walloon, and by the treaty of Arras, Jan. 1579, he secured the support of the "Malcontents," as the Catholic nobles of the south were styled, to the royal cause. The reply to the treaty of Arras was the Union of Utrecht, concluded a few weeks later between the seven northern provinces, who abjured the sovereignty of King Philip and bound themselves to use all their resources to maintain their independence of Spanish rule.

Farnese, as soon as he had obtained a secure basis of operations in Hainaut and Artois, set to work to reconquer Brabant and Flanders. Tournai, Maastricht, Breda, Bruges and Ghent opened their gates, and finally he laid siege (1584) to Antwerp. The town was resolutely defended by the citizens under Philip de Marnix, lord of St. Aldegonde, who was assisted by the engineer Gianibelli (q.v.). Farnese cut off all access to Antwerp from the sea by constructing a bridge of boats across the Scheldt from Calloo to Oordam. On Aug. 15, 1585, Antwerp was compelled by famine to capitulate. The whole of the southern Netherlands was brought once more to recognize the authority of Philip. But Holland and Zeeland continued to defy Farnese (see NETHERLANDS: History).

In 1586 Alexander Farnese became duke of Parma by the death of his father. Philip would not permit him to leave the Netherlands; but neither would he permit him to use his veteran army to reconquer the Northern Provinces, though the moment was opportune. The king's whole energies were directed to the preparation of an Invincible Armada for the conquest of England, and Parma was ordered to collect an enormous flotilla of transports and to keep his army concentrated and trained for the projected invasion of the island realm of Queen Elizabeth. Thus the critical period passed by unused, and in the interval the Dutch had found in the youthful Maurice of Nassau, a military genius. Moreover, the accession to the throne of France of Henry of Navarre had relieved the pressure upon the Dutch, and placed Parma and his army between hostile forces. The expenditure upon the Armada had depleted the Spanish treasury, and in 1590 Farnese could get no regular supplies of money from the king for the payment of the soldiery, and he had to pledge his own jewels. A mutiny

broke out, but was suppressed. Parma now received orders to raise the siege of Paris, which was blockaded by Henry IV. He left the Netherlands on Aug. 3, 1590, at the head of 15,000 troops. By brilliant generalship he outwitted Henry and succeeded in relieving Paris; but owing to lack of money and supplies he was compelled immediately to retreat to the Netherlands, abandoning on the march many stragglers and wounded.

Again in 1591, in the midst of a campaign against Maurice of Nassau, Parma was obliged to march to relieve Rouen. He succeeded but was wounded before Caudebec, and was finally compelled to withdraw his army. He died at Arras on Dec. 3, 1592. He was honoured by a splendid funeral at Brussels, but his body was interred at his own capital city of Parma. He left two sons, Ranuccio who succeeded him, and Edward, who was created a cardinal in 1591 by Pope Gregory XIV. His daughter Margaret married Vincent, duke of Mantua.

See L. P. Gachard, *Correspondance d'Alexandre Farnese, Prince de Parme, gouverneur général des Pays-Bas, avec Philippe II., 1578-1579* (Brussels, 1850); Pietro Fea, *Alessandro Farnese, duca di Parma* (1886).

FARNESE, ELIZABETH (1692-1766), queen of Spain, born on Oct. 25, 1692, was the only daughter of Odoardo II., prince of Parma. At the age of 21 (1714) she was married by proxy at Parma to Philip V. of Spain. The marriage was arranged by Cardinal Alberoni (*q.v.*), with the concurrence of the Princess des Ursins, the *Camerara Mayor*. On arriving at the borders of Spain, Elizabeth was met by the Princess des Ursins, and at once ordered her to be removed from her presence and from Spain. Over the weak king Elizabeth quickly obtained complete influence, which she exerted in favour of Alberoni's policy of expansion. When the French forces advanced to the Pyrenees, she placed herself at the head of one division of the Spanish army. But the Triple Alliance thwarted her plans, and in 1720 the allies made the banishment of Alberoni a condition of peace. Sicily also had to be evacuated. In 1724 Philip abdicated and retired to the palace of La Granja. Seven months later, however, the death of the young king recalled him to the throne. During his later years, when he was nearly imbecile, Elizabeth directed the whole policy of Spain so as to secure thrones in Italy for her sons. In 1736 she saw the accession of her son Don Carlos (afterwards Charles III. of Spain) to the throne of the Two Sicilies and his recognition by the powers in the treaty of Vienna. Her second son, Philip, became duke of Parma. Elizabeth survived her husband 20 years, dying in 1766.

See *Mémoires pour servir à l'histoire d'Espagne sous le règne de Philippe V.*, by the Marquis de St. Philippe, translated by Maudave (1756); *Memoirs of Elizabeth Farnese* (1746); and E. Armstrong, *Elizabeth Farnese, the Terzagant of Spain* (1892).

FARNHAM, a market town in the Farnham parliamentary division of Surrey, England, 38½ m. S.W. by W. from London on the Southern railway. Pop. of urban district (1931) 18,294; but in 1926 the area of the urban district was enlarged. Farnham lies on the left bank of the river Wey, on the southern slope of a hill rising about 700 ft. above the sea-level. The parish church of St. Andrew is a transitional Norman and Early English building, with later additions, and was formerly a chapel of ease to Waverley abbey, of which a crypt and fragmentary remains, of Early English character, stand in the park attached to a modern residence of the same name. This was the earliest Cistercian house in England, founded in 1128 by William Gifford, bishop of Winchester. The *Annales Waverlienses*, published by Gale in his *Scriptores* and afterwards in the Record series of *Chronicles*, are believed to have suggested to Sir Walter Scott the name of his first novel. Farnham Castle, on a hill north of the town, the palace of the bishops of Winchester, was first built, shortly after the abbey, by Henry de Blois, bishop of Winchester, and brother of King Stephen; but it was razed by Henry III. Rebuilt and garrisoned for Charles I., it suffered during the Civil War, and was restored by George Morley, bishop of Winchester (1662-84). William Cobbett (*q.v.*) was born in the parish, and is buried in the churchyard of St. Andrew's. The neighbouring mansion of Moor Park was the residence of Sir William Temple (d. 1699), when Swift worked here as his secretary. Hester Johnson, Swift's

"Stella," was the daughter of Temple's steward, whose cottage still stands. The town has grown in favour as a residential centre from the proximity of Aldershot Camp (3 m. N.E.).

The town of Farnham (Fernehām) grew up round the castle of the bishops of Winchester, who possessed the manor at the Domesday Survey. Its position at the junction of the Pilgrim's Way and the road from Southampton to London was important. In 1205 Farnham had bailiffs, and in 1207 it was definitely a mesne borough under the bishops of Winchester. In 1247 the bishop granted the first charter, giving, among other privileges, a fair on All Saints' Day. Bishop Waynflete is said to have confirmed the original charter in 1452, and in 1566 Bishop Horne granted a new charter. In the 18th century the corporation, a close body, declined, its duties being performed by the vestry, and in 1789 the one survivor resigned and handed over the town papers to the bishop. Farnham sent representatives to parliament in 1311 and 1460, on both occasions being practically the bishop's pocket borough. Farnham was early a market of importance, and in 1216 a royal grant changed the market day from Sunday to Thursday in each week. It was famous in the early 17th century for wheat and oats, and hop-growing has been carried on in the vicinity since 1597.

FARNWORTH, urban district, Farnworth parliamentary division, Lancashire, England, on the Irwell, 3 m. S.W. from Bolton on the L.M.S. railway. Pop. (1931), 28,711. Collieries, cotton mills, iron foundries, brick and tile works employ many hands.

FARO, the capital of a district bearing the same name, in southern Portugal; at the terminus of the Lisbon-Faro railway, and on the Atlantic Ocean. Pop. (1920) 12,925. Faro is an episcopal see. Its broad but shallow harbour is protected on the south by the long island of Cães, and a number of sandy islets, which, being constantly enlarged by silt from the small river Feroso, render the entrance of large vessels impossible. Fish, with wine, fruit, cork, baskets and sumach, are the principal articles of export. Little has been done to develop the mineral resources of the district, which include tin, lead, antimony and auriferous quartz. Faro was taken from the Moors in 1249. It was sacked by the English in 1596, and nearly destroyed by an earthquake in 1755.

The administrative district of Faro coincides with the ancient kingdom and province of Algarve (*q.v.*).

FARO, a game of cards, played with a full pack (from *Pharaoh*, a picture of the Egyptian king appearing in a card of the old French pack). Originally the pack was held in the dealer's left hand, but nowadays very elaborate and expensive implements are used. The dealer places the pack, after shuffling and cutting, in a dealing-box, face upwards, and the cards are taken from the top of the box in couples through a slit in the side. The exposed card on top is called *soda*, and the last card left in the box is *in hoc*. The implements include counters of various colours and values, a dealing-box, a case or frame, manipulated by a "case-keeper," upon which the cards already played are arranged in sight, a shuffling-board, and score-sheets for the players. Upon the table is the "lay-out," a complete suit of spades enamelled on green cloth, upon or near which to place the stakes. The dealer takes two cards from the box, placing the first one near it and the second close beside it. Each deal of two cards is called *a turn*, and there are 25 such, *soda* and *hoc* not counting. The players stake upon any card they please, or in such manner as to take in several cards, reducing the amount, but increasing the chances of winning, as at roulette. The dealer, having waved the hand, after which no more bets may be made, deals the turn, and then proceeds to gather in the stakes won by him, and to pay those he has lost. The chances as between dealer and punters, or players, are equal, except that the banker wins half the money staked on the cards of a turn should they chance to be alike.

See J. Debrett, *Faro and Rouge et Noir* (1793).

FAROE ISLANDS: see FAEROE ISLANDS.

FARQUHAR, GEORGE (1677-1707), British dramatist, son of William Farquhar, a clergyman, was born in Londonderry, Ireland, in 1677. He was educated at Trinity College, Dublin. He became an actor on the Dublin stage, but in a fencing scene

in Dryden's *Indian Emperor* he forgot to exchange his sword for a foil, with nearly fatal results to a fellow-actor, and never acted again. At the suggestion of Robert Wilks, the comedian, he wrote his first play, *Love and a Bottle*, which was performed at Drury Lane in 1698. His second comedy, *The Constant Couple* (1699) ridiculing the pilgrimages to Rome in the Jubilee Year, was enthusiastically received, Wilks as Sir Harry Wildair contributing largely to its success. In 1701 he wrote a sequel, *Sir Harry Wildair*, and in 1702 *The Inconstant*, borrowed from Fletcher's *Wild Goose Chase*. In the same year he published a volume of miscellanies, *Love and Business*, containing a "Discourse on Comedy," defending the English neglect of the dramatic unities. In 1703 he married, in expectation of a fortune which did not materialize. The rest of his life was a constant struggle against poverty. His other plays are *The Stage Coach* (1704), a one-act farce from the French; *The Twin Rivals* (Drury Lane, 1702); *The Recruiting Officer* (Drury Lane, 1706); and *The Beaux' Stratagem* (Haymarket, 1707). This is the best of his plays, and long kept the stage. Genest notes 19 revivals up to 1808. It was revived again at the Lyric, Hammersmith, in 1927. The plot concerns the adventures of two embarrassed gentlemen who travel as master and servant, in the hope of marrying a fortune. Archer, the supposed valet, was one of Garrick's best parts. Before he had finished the second act of *The Beaux' Stratagem* he was taken mortally ill, but he finished the play, for which he had been paid in advance. It was staged on March 8, and he had his third night, with an extra benefit on April 29, 1707, the day of his death.

Farquhar marks the end of the true Restoration tradition. Instead of the intellectual foil-play of his predecessors he gives us something of the cheerful singlestick of Elizabethan comedy, while his return to the romantic treatment of love, whether you regard it as a disastrous lapse into the "luscious" or a breath of purer air, is at any rate fatal to the maintenance of the Restoration atmosphere. His characters are lively and amusing, his plots ingenious and well worked out. But for his early death he might have been very great.

Farquhar's dramatic works were published in 1728, 1742 and 1772, and by Thomas Wilkes with a biography in 1775. They were included in the *Dramatic Works of Wycherley, Congreve, Vanburgh and Farquhar* (1849) edit. by Leigh Hunt. See also A. C. Ewald, *Dramatic Works of George Farquhar, with Life and Notes* (2 vols., 1892); L. I. Guiney, *A Little English Gallery* (1894); *The Beaux' Stratagem*, ed. H. Macauley Fitzgibbon (1898); D. Schmid, "George Farquhar," in *Wiener Beiträge zur engl. Philol.* (Vienna, 1904); *The Best Plays of George Farquhar*, edit. William Archer (1906); H. Ten E. Perry, *The Comic Spirit in Restoration Drama* (New Haven, Conn. 1925).

FARR, WILLIAM (1807-1883), English statistician, was born at Kenley, in Shropshire, on Nov. 30, 1807. He studied medicine in Paris and London, but only practised for five years. In 1837 he obtained a post in the registrar-general's office. For the censuses of 1851 and 1861 he acted as assistant-commissioner; for that of 1871 he was a commissioner, and he wrote the greater part of the reports of all. He resigned in 1879 on failing to obtain the post of registrar-general. He died on April 14, 1883. He was the author of many papers on general statistics and on life-tables for insurance. A selection from his statistical writings was published in 1885 under the editorship of Mr. Noël Humphreys.

FARRAGUT, DAVID GLASGOW (1801-1870), American admiral, was born on July 5, 1801, near Knoxville, Tenn. At New Orleans he formed a close friendship with Capt. David Porter of the Navy, the result of which was that Porter adopted his young namesake, and put him in the Navy in 1810. He went to sea the next year on board the U.S.S. "Essex" with Porter, who took every opportunity to throw responsibility on the boy. Farragut commanded a prize with ability when only 12 years old, served with credit in the "Essex's" desperate fight with H.M.S. "Phoebe," and returned to the United States to go to school. The next few years were devoted alternately to service afloat and to school. He learned French, Italian and Arabic. Before he was 20 he was already a most accomplished officer. In 1823 the Navy department placed Comm. Porter in command of a squadron to destroy the pirate strongholds in the West Indies. Farragut

accompanied Porter, and very active service ashore and afloat may be said to have completed Farragut's education. He had even had practice in handling a steamer and went home in 1824 in command of the U.S.S. "Ferret." Routine service followed for many years. As he entered his 60th year the Civil War was at hand, in which his brilliant record was to give him enduring fame. He had had the most varied experience and was a practical seaman who found pleasure in the responsibilities of command. Yet he had never failed to maintain professional and cultural studies. Somewhat under the middle height, he was of very unusual physical strength, still agile and athletic and a skilled swordsman. Kindly and gentle in his demeanour and of a cheerful and humorous disposition, he was highly successful in making his ship's company both efficient and contented. He was easily approachable, yet in his bearing there was dignity without stiffness. In every way he reached the traditional naval standard of the "officer and gentleman." Withal, he was a highly religious man, who was accustomed in times of stress to draw strength and confidence from reliance upon the Almighty. To all these minor virtues of a great captain he added the supreme combatant qualities of a great reliance on his own abilities; a confidence that the enemy's difficulties, if not identical, were probably no less than his own; a firm resolution and readiness to attack, and finally a steadfast belief that "the best protection against the enemy's fire is a well-directed fire from our own guns."

The Civil War opened in the spring of 1861, and in Dec. 1861 he was assigned to command the West Gulf Blockading squadron, with orders to enter the Mississippi river and capture New Orleans. The strategic plan of the Administration for the reduction of the seceding States assigned a great rôle to the Navy. While the armies in the field were to oppose the Southern forces, the task of the Navy was to cut the hostile armies from their sources of supply over seas, for which they expected to pay by exporting cotton. The first step of the Navy was to establish a blockade of the coast from the Chesapeake to the Rio Grande. By the end of 1861 this blockade was becoming fairly effective, but munitions of war landed in Mexico were finding their way along the Red river and the Mississippi to Southern armies. The second great strategic operation of the Navy was to seize control of the Mississippi and stop the supply of food-stuffs and munitions coming from the South-west. An army in conjunction with a flotilla of river craft undertook this task from the North, while Farragut with the same purpose moved from the open sea against New Orleans, the metropolis of the South, where success would secure him a most valuable base for subsequent advance. The War department believed that the forts on the river below the city should be reduced by mortar fire before attempting to thrust wooden ships past them, but Farragut carried out his own bolder plan of running by them in the dark and was completely successful on April 24, 1862. His position above the forts cut them off from the city. Troops from the transports outside could land almost under his protecting batteries and the result was the surrender of the forts and the city. Against Farragut's opinion the department insisted on his proceeding further up the river, but the time was inopportune and nothing important was then accomplished. But the following year, when Grant's army was occupied before Vicksburg, Farragut greatly aided him by passing the heavy works at Port Hudson below the Red river and stopping traffic along that stream. Vicksburg fell in July 1863 and the Mississippi was soon in Federal control to the great loss of the Southern armies fighting in Tennessee and Virginia. Farragut now turned his attention to entering Mobile bay, where he expected an army from the North to meet him and so to cut off another great slice from the Confederacy, but the troops were employed elsewhere. Mobile bay was formed by a long sandspit enclosing a large inlet. It was defended by several forts, of which the strongest was Ft. Morgan at the end of the spit close to the channel. A line of mines obliged ships to pass close to Ft. Morgan, and besides the heavy ironclad "Tennessee" covered the approaches. Farragut had to wait till he had monitors to pit against the "Tennessee" and on Aug. 5, 1864, he entered in two columns, the monitors leading and the wooden frigates following each

with a gunboat lashed to her port side. Farragut in the "Hartford" held the second place in his column. The leading monitor, "Tumseeh," in her anxiety to engage the "Tennessee," crossed the mine-field and was blown out of the water. The "Brooklyn," leading the wooden column, stopped: her head fell away; the line drifted in confusion while the tide swept all upon the fort. This was the great moment of Farragut's life. Disaster was imminent. With instant decision he shouted "Damn the torpedoes!" to the hesitating "Brooklyn," and swung his own ship clear of her and headed across the mines which had just been fatal to the monitor. The mine cases rattled against the bottom but none exploded and the fleet followed on and anchored triumphantly above the fort. Then the "Tennessee" came out from the shelter of the fort and after a hard fight, in which the wooden ships repeatedly rammed her, she was reduced to impotence and surrendered. The forts were now isolated and surrendered one by one, Ft. Morgan waiting till the troops lying outside in transports had landed their siege guns and brought them into action. Farragut's health now forbade further active service. His work was over. He had been made rear-admiral in 1862, vice-admiral in 1864, and admiral in 1866. In 1867 he went to Europe on board the U.S.S. "Franklin" and paid a round of ceremonial visits to the seaports of the Great Powers to accept on behalf of the United States their congratulations on the conclusion of the Civil War. He died at Portsmouth, N.H., on Aug. 14, 1870. (W. L. R.)

FARRAND, LIVINGSTON (1867—), American educationalist, was born at Newark, N. J., June 14, 1867. After he graduated from Princeton university in 1888, he studied medicine at the College of Physicians and Surgeons, New York (M.D., 1891). During the next two years he studied at Cambridge (England) and at Berlin. From 1893 to 1901 he was an instructor and from 1901 adjunct professor in psychology at Columbia university; from 1903 to 1914 he was professor of anthropology. In 1897 he accompanied the Jesup North Pacific expedition, which visited the Indians of British Columbia. From 1905 to 1914 he was executive secretary of the National Association for Study and Prevention of Tuberculosis, and from 1912 to 1914 treasurer of the American Health Association and editor of the *American Journal of Public Health*. From 1914 to 1919 he was president of the University of Colorado, but in 1917 was granted leave of absence, following his appointment by the international health board of the Rockefeller Foundation to direct the work against tuberculosis in France. In 1919 he was made chairman of the central committee of the American Red Cross. In 1921 he was elected to succeed Jacob Gould Schurman as president of Cornell university. He wrote *The Basis of American History* (1904) and various articles on psychology and anthropology.

FARRANT, RICHARD (d. 1580), composer of English church music, became a gentleman of the Chapel Royal in the reign of Edward VI., but resigned his post in 1564 on being appointed master of the children of St. George's chapel, Windsor. It is stated by Hawkins (*History of Music*, vol. iii. 279) that Farrant was also one of the clerks and organists of St. George's chapel, and that he retained these posts till his death. Many of his compositions are printed in the collections of Barnard and Boyce. Among the most admired of them are a service in G minor, and the anthems "Call to remembrance" and "Hide not Thou Thy face." It is doubtful whether Farrant is entitled to the credit of the authorship of the beautiful anthem "Lord, for thy tender mercies' sake." No copy of the music under his name appeared in print till 1800, although it had been earlier attributed to him. Some writers have named John Hilton, and others Thomas Tallis, as the composer. Farrant died on Nov. 30, 1580.

FARRAR, FREDERIC WILLIAM (1831–1903), English divine, was born on Aug. 7, 1831, in the fort of Bombay, where his father, afterwards vicar of Sidcup, Kent, was a missionary. His early education was received in King William's college, Castle-town, Isle of Man, a school whose external surroundings are reproduced in his school tale, *Eric*; or, *Little by Little*. In 1847 he entered King's college, London, and was led by F. D. Maurice to the study of Coleridge, whose writings had a profound influence upon his faith and opinions. He went up in 1851 to Trinity

college, Cambridge, where he became a fellow in 1856.

On leaving the university Farrar became an assistant-master. first at Marlborough College, and then (1855) at Harrow. In 1871 he was appointed headmaster of Marlborough College, and in the following year chaplain-in-ordinary to the queen, becoming canon of Westminster and rector of St. Margaret's, Westminster, in 1876. Farrar's first book was his schoolboy story *Eric* (1858) followed by *Julian Home* and *Lyrics of Life* (1859) and by *St. Winifred's; or the World of School* (1862). His Hulsean lectures were published in 1870 under the title of *The Witness of History to Christ. The Life of Christ*, which was published in 1874, passed through a great number of editions. His volume of sermons on *Eternal Hope* (1877)—in which he called in question the dogma of everlasting punishment—caused much controversy but helped to mollify the harsh theology of an earlier age. In 1879 appeared *The Life and Works of St. Paul*, followed by *The Early Days of Christianity* (1882), and other popular works. Farrar was a copious contributor of articles to various magazines, encyclopaedias and theological commentaries. In 1883 he was made archdeacon of Westminster and rural dean; in 1885 he was appointed Bampton lecturer at Oxford, and took for his subject "The History of Interpretation." He was appointed dean of Canterbury in 1895. He died at Canterbury on March 22, 1903. See his *Life*, by his son R. Farrar (1904).

FARRAR, GERALDINE (1882—), American dramatic soprano, was born at Melrose (Mass.), on Feb. 28, 1882. Her musical education was received in Paris under Trabedello and in Berlin under Lilli Lehmann. When but 19 she made her début at the Royal Opera House, Berlin, as Marguerite in *Faust*, Oct. 15, 1901, and continued to sing there consecutively until 1914. In Nov. 1906 she appeared at the Metropolitan Opera House as Juliette in *Roméo et Juliette* and was a favourite prima donna of the New York stage until her retirement on April 22, 1922. She afterwards took her own company on the road and reappeared on the concert stage in New York in Dec. 1927. Her rôles included Mme. Butterfly, Manon, Micaela, Mignon, Mimi, Elizabeth, Tosca, Zerlina, Gilda and Violetta. She acted also in motion pictures, her best-known films being *Carmen*, *Joan of Arc* and *The Woman and the Puppet*.

FARRELL, JAMES A. (1863—), American business man, was born in New Haven (Conn.), Feb. 15, 1863, and was educated in the public schools there. In 1889 he married Catherine E. McDermott. At a very early age he was a labourer in a steel-wire mill, in New Haven; a little later, labourer in the mills of the Pittsburgh Wire Company; then superintendent and manager of the Oliver Steel Wire Company; later, general superintendent of the same organization; and then, general manager of the Oliver Iron and Steel Company. Following this, at Braddock (Pa.), Farrell was employed by a wire company, which was made part of the American Steel and Wire Company in 1899, and of this consolidation Farrell was made foreign sales agent. When, in 1901, the United States Steel Corporation was organized, the first billion-dollar American corporation, he was chosen for the position of foreign sales agent of all subsidiaries of the company. So successful was he that in 1903 the United States Steel Products Export Company was formed to co-ordinate the foreign activities of all the subsidiary firms, with Farrell as president (1903–11). During this period he developed foreign sales to astounding figures. He was responsible for the corporation building a fleet of its own, in which there were in 1928 54 vessels. In 1911 he became president of the United States Steel Corporation. In 1928 he was a director of the American Bridge Company; Federal Steel Company; Tennessee Coal, Iron and Railroad Company; Minnesota Steel Company and other subsidiaries; and vice-president of the American Iron and Steel Institute.

FARRELL, a borough of Mercer county, Pa., U.S.A., on the Shenango river, at the western boundary of the State, 60m. N.N.W. of Pittsburgh, and adjoining the city of Sharon, with which it forms virtually an industrial unit. It is served by the Erie, the Mercer Valley, the New York Central, the Pennsylvania, and the Pittsburgh and Lake Erie railways. The population was 15,586

in 1920, of whom 6,504 were foreign-born white; and was 14,359 in 1930. It has important manufactures of steel, wire, tin plate, sheet steel and iron, castings, boilers and coke. The borough was incorporated in 1901, and took the name of Farrell.

FARREN, ELIZABETH (c. 1759–1829), English actress, was the daughter of George Farren, an actor. Her early years were spent among the touring company to which her parents belonged, and her first regular engagement was at a Liverpool theatre in 1773. She came to London in 1777, where she first played at the Haymarket as Miss Hardcastle in *She Stoops to Conquer*. There was talk of a marriage between her and Charles James Fox, but her appearance in a "breeches" part convinced him that she had no figure. A success in comedy parts from the start, she had at first to compete with Mrs. Abington, who was generally thought her superior. When Mrs. Abington left Drury Lane in 1782 Miss Farren was her natural successor. She was beloved by the Lord Derby of the time; after the death of his wife she left the stage and married him (1797). She died on April 23, 1829.

Attempting tragedy rarely and unsuccessfully, she was supreme in her representations of the fine ladies of comedy, Lady Teazle, Lady Betty Modish and, above all, Lady Townley, in which part she was thought to surpass even Mrs. Abington. Walpole thought her the most perfect actress he had ever seen.

See H. Simpson and C. Braun, *A Century of Famous Actresses* (London, 1913).

FARREN, ELLEN (NELLIE) (1848–1904), English actress, was born on April 16, 1848, of a family of actors. Her first London appearance was at the Sadler's Wells theatre in 1862. From 1864 to 1868 she was at the Olympic in burlesque and light comedy parts, including Nerissa in the *Merchant of Venice*. In 1868 she joined Hollingshead at the Gaiety, where she played Robert in Gilbert's *Robert the Devil*. Here she stayed till she retired in 1891, playing every sort of part, farce, burlesque, old comedy and Shakespeare. Her first association with Fred Leslie in the partnership which became so famous was in *Little Jack Sheppard*, as Jack. In addition to innumerable burlesque parts of this type, she played Prue in *Love for Love*, both the leading girls' parts in *The Rivals*, Ursula in *Much Ado about Nothing*, and Maria in *Twelfth Night*. With Fred Leslie she visited America in 1889 and Australia in 1891. She was forced to retire by gout, and died of it on April 28, 1904. Chiefly famous for her acting in burlesque, she had an amazingly vivid personality, and was easily the favourite actress of the lighter stage of her day. She was the incarnation of the Cockney spirit. Hollingshead says of her in *My Lifetime*, "She could play anything, dress in anything, say and do anything," and that she ought to go down to posterity as the best Principal Boy since women were admitted to the stage.

FARRER, THOMAS HENRY FARRER, 1ST BARON (1819–1899), English civil servant and statistician, the son of a solicitor, was born in London on June 24, 1819, and was educated at Eton and Balliol college, Oxford. He was called to the bar at Lincoln's Inn in 1844, but retired from practice in the course of a few years. He entered the civil service in 1850, and in 1865 he was promoted to be one of the joint secretaries of the board of trade, of which he was permanent secretary from 1867 to 1886. In 1889 he was co-opted by the Progressives an alderman of the London County Council, of which he became vice-chairman in 1890, but soon resigned because, being a strong individualist, he deprecated municipalization of public services. In 1893 he was raised to the peerage. From this time forward he devoted much of his energy to free trade propaganda. Farrer died at Abinger hall, Dorking, on Oct. 11, 1899. His works include: *The State in Relation to Trade* (1883), *Free Trade versus Fair Trade* (1886), and *Studies in Currency* (1898).

FARRÈRE, CLAUDE, pen-name of Charles Bargone (1876–), French novelist. He was a naval officer; he made his reputation with a series of novels, the scenes of which were laid in the Far East or in Eastern Europe. He drew vivid pictures of men and women of alien civilizations, notably the old Chinaman in *La Bataille* (1909), and the old Turk of *L'Homme qui*

assassina (1907). He then turned, with less artistic success, to the tale of adventure, of which the most famous is *Thomas d'Agnelet, gentilhomme de fortune* (1913). His later works include *Cent millions d'or* (1927); *L'autre côté* (1928); *la Marche funèbre* (1929).

FARRIER, and **FARRIERY**, the name given generally either to the professional shoer of horses or in a more extended sense to a practitioner of the veterinary art; farriery is the term for his business. Primarily the art of farriery is identical with that of the blacksmith, in so far as he makes and fixes shoes on horses (see HORSE-SHOES); he is liable in law for negligence, as one who holds himself out as skilled; and he has a lien on the animal for his expenses. William the Conqueror is supposed to have introduced horse-shoeing into England, and the art had an important place through the middle ages, the days of chivalry, and the later developments of equitation. In modern times it has been closely allied with the general progress in veterinary science and in the knowledge of the anatomy and physiology of the horse's foot and hoof.

See A. T. Fisher, *The Farrier* (1893); A. Lungwitz, *Text-Book of Horse-shoeing* (Eng. trans. 1898).

FARRUKHABAD, a city and district of British India in the Agra division of the United Provinces. The city is near the right bank of the Ganges, 87 m. by rail from Cawnpore. It forms a joint municipality with Fatehgarh, the civil headquarters of the district. Pop. (1921) 48,331. At Fatehgarh is the government gun-carriage factory; and other industries include cotton-printing of curtain material and the like, and the manufacture of gold lace, metal vessels and tents.

The DISTRICT OF FARRUKHABAD has an area of 1,683 sq.m. It is a flat alluvial plain in the middle Doab. The principal rivers are: the Ganges, which has a course of 87 m. either bordering on or passing through the district; the Kali-nadi (84 m.) and the Isan (42 m.), both tributaries of the Ganges; and the Arind which, after a course of 20 m. in the south of the district, passes into Cawnpore. The principal products are rice, wheat, barley, millets, pulses, cotton, sugar-cane and potatoes. Farrukhabad is one of the healthiest districts in the Doab.

In the early part of the 18th century Mohammed Khan, governor of Allahabad and later of Malwa, established a considerable state of which the present district of Farrukhabad was the nucleus, founding the city of Farrukhabad in 1714. After his death in 1743, his sons were embroiled by Safdar Jang, the nawab wazir of Oudh, with the Rohillas, and afterwards with the Mahrattas, the struggle ending by the country becoming tributary to Oudh. In 1801 the nawab wazir ceded to the British his lands in this district. In 1804 the Mahrattas, under Holkar, ravaged this tract, but were utterly routed by Lord Lake at the town of Farrukhabad. During the Mutiny the titular nawab was re-instated on the throne. The English military residents took shelter in the fort, which they held until July 4 when, the fort being undermined, they endeavoured to escape by the river. One boat succeeded in reaching Cawnpore, but only to fall into the hands of Nana. Its occupants were made prisoners, and perished in the massacre of July 10. The other boat was stopped on its progress down the river, and all those in it were captured or killed except four who escaped. The prisoners were conveyed back to Farrukhabad, and murdered there by the nawab on July 19. The rebels were defeated in several engagements, and on Jan. 3, 1858 the English troops recaptured Fatehgarh fort. In 1921 the population was 856,633. Part of the district is watered by distributaries of the Ganges canal; tobacco, potatoes and fruit, cotton-prints, scent and saltpetre are among the principal exports.

FARS, a province of Persia, bounded on the north by the provinces of Khuzistan and Isfahan, on the east by Yazd and Kirman, and on the south by the Persian gulf. It lies roughly between 50° and 57° E., and 26° and 32° N., and is composed of a great number of districts grouped together into some 20 sub-provinces, each under a governor. The coast towns of Bushire, Lingeh, Bandar Abbas, Jask, Chahbar and some other smaller places, though not all geographically within the boundaries of Fars, form a separate administrative district known as the "Gulf Ports" or "Southern Ports" under a governor appointed from Tehran.

Fars was the ancient Persis (*q.v.*) or Persia in the narrowest sense, the ancestral home of the Persians. The country was in those days covered with fortresses, the best known of which were the three citadels which were built on peaks round Istakhr (*see* PERSEPOLIS).

Climatically, Fars may be divided into *garmsir* and *sardsir*—the warm and cold regions. The former extends from the coast to the foothills running parallel to it and includes the coastal districts of Liravi, Haiat Daud, Rud Hillah, Angali, Shabankareh, Zira, Dashtistan, Tangistan and Dashti. The *sardsir* embraces the mountainous parts of the province which form a succession of ridges, prolongations of the Zagros chain, running from north-west to south-east and intersected by elevated plains some of which are fertile and afford good pasture. The highest of these mountains, the Kuh Diná in the north-western part of the province, has an elevation of over 13,000 feet. The rivers within the limits of Fars are the Rud Hillah and Mund, and a notable feature is the great inland depressions or salt lakes near the middle of the province into which several inland streams drain.

The chief town of the province is Shiraz (*q.v.*) 182 m. N.E. of Bushire, and other populous centres are Niriz, Lar, Abadeh, Darab, Jahrum, Arsinjan, Ardakan, Fasa, Bastak, Kazerun, Firuzabad and Minab (under Bandar Abbas, *q.v.*). The population has been estimated at 750,000 but this is probably much too high. About a third are nomads of mixed race and turbulent character. Among the tribes of Fars are the Mamasseni whose habitat lies north of Kazerun; the Khamseh, a group of tribes of Arab origin and speech; and the Qashqai, really a collection of tribes, of Turk origin and speech and migratory habits, who are somewhat scattered and whose summer resorts are in the highlands between Shiraz and Isfahan. The Qashqai are nominally under the control of an Ilkhani or chief, but his influence in Fars, which was once great, has of recent years been greatly restricted by the Central Government.

Many districts of Fars are comparatively fertile, but are now impoverished by droughts, ravages of locusts and past misgovernment. The products consist principally of cereals, tobacco, fruits and opium, with a little cotton. The wine of Shiraz is highly thought of in Persia, and is, on occasions, of excellent quality. Tobacco, of excellent quality, is grown mainly around Fasa, Darab and Jahrum for home consumption, and rosewater is exported from Maimand. Sulphur and lead are found, but not in commercial quantities. The coastal region of Fars has been explored for petroleum, several wells having been sunk by the Anglo-Persian Oil Co. Ltd. at Salakh on Qishm island and at Bikarz, Chilingar and Gach Qaraguli, north of Ganawah, but hitherto without result. A well was also sunk by the Persian Mining Rights Corporation in 1890-95 near Dalaki, but without success.

The revenue of Fars and Southern Ports in 1926-27 was 20,677,167 Krans, coming fourth, in order of importance, as a revenue producing province. (P. Z. C.)

FARTHING, the smallest English coin, equal to the fourth of a penny. (A. S. *feorþa*, fourth, +*ing*, diminutive.) It became a regular part of the coinage from the reign of Edward I., and was, up to the reign of Mary, a silver coin. No farthing was struck in the reign of Elizabeth, but a silver three-farthing piece was issued in that reign, with a profile bust of the queen crowned, with a rose behind her head, and inscribed "E.D.G. Rosa sine spina." The copper farthing was first introduced in the reign of James I., a patent being given to Lord Harington of Exton in 1613 for the issue of copper tokens of this denomination. It was nominally of six grains weight, but was usually heavier. Properly, however, the copper farthing dates from the reign of Charles II., in whose reign also was issued a tin farthing, with a small copper plug in the centre, and an inscription on the edge, "Nummorum famulus 1684." No farthings were actually issued in the reign of Queen Anne, though a number of patterns were prepared. In 1860 the copper farthing was superseded by one struck in bronze. In 1842 a proclamation was issued giving currency to half-farthings, and there were several issues, but they were demonetized in 1869. In 1897 the practice was adopted of darkening farthings before issue, to prevent their being mistaken for half-sovereigns.

FARTHINGALE, a case or hoop, originally of bent rods, but afterwards made of whalebone, upon which were hung the voluminous skirts of a woman's dress (a corruption of Span. *verdago*, from *verdago*, a rod or stick). The fashion was introduced into England from Spain in the 16th century. In its most exaggerated shape, at the beginning of the 17th century, the top of the farthingale formed a flat circular surface projecting at right angles to the bodice (*see* DRESS).

FARWELL, SIR GEORGE (1845-1915), English judge, was born at Codsall, Staffs., on Dec. 22, 1845. He was educated at Rugby and at Balliol College, Oxford, and was called to the bar in 1871. In 1891 he became a Q.C. and in 1895 a bencher of Lincoln's Inn, while in 1899 he was raised to the bench. In 1900 he came into prominence over the case known as the Taff Vale judgment, since his decision, though reversed by the court of appeal, was upheld in 1901 by the House of Lords, and ultimately led to the passing of the Trade Disputes Act (1906). In 1906 Farwell was made a lord of appeal, but resigned his position in 1913. He died at Dunster, Somerset, on Dec. 30, 1915. He published *Concise Treatise on the Law of Powers* (1874).

FASCES, in Rome, bundles of elm or birch rods from which the head of an axe projected, fastened together by a red strap. As the emblem of official authority, they were carried by the

FROM "DICTIONARY OF GREEK AND ROMAN ANTIQUITIES" (MURRAY)
ROMAN LICATORS BEARING FASCES

lictors, in the left hand and on the left shoulder, before the higher Roman magistrates, at the funeral of a magistrate, behind the bier. The lictors and the *fasces* were so inseparably connected that they came to be used as synonymous terms. The *fasces* represented the power over life and limb possessed by the kings; later, the consuls were preceded by 12 *fasces*. Within the precincts of the city the axe was removed, in recognition of the right of appeal (*provocatio*) to the people in a matter of life and death; outside Rome, however, each consul retained the axe. Valerius Publicola established the custom that the *fasces* should be lowered before the people, as the real representatives of sovereignty; lowering the *fasces* was also the manner in which an inferior saluted a superior magistrate. A dictator had 24 *fasces* (including the axe, even within the city); other magistrates had *fasces* varying in number, with the exception of the censors, who, possessing no executive authority, had none. A victorious general, who had been saluted "imperator" by his soldiers, had his *fasces* crowned with laurel. Under the empire, the laurel was regarded as distinctive of the imperial *fasces*.

In recent years in Italy, the *fasces* were adopted as the emblem of the Fascist Party (*see* FASCISM).

See J. E. Sandys, *Companion to Latin Studies* (1921).

FASCIA or **FACIA**, in architecture, any horizontal decorative band or board.

FASCINATION. The art of enchanting or bewitching, especially through the influence of the "evil eye," and so, of the exercise of an evil influence over the reason or will (from Lat. *fascinare*, to bewitch). The word is thus used of the supposed paralysing attraction exercised by some reptiles on their victims. In a quite general sense, fascination means the exercise of any charm or strong attraction.

FASCINE, a large faggot of brushwood used in the revetments of earthworks and for other purposes of military engineering (from the Lat. *fascina*, *fascis*, a bundle of sticks). The British service pattern of fascine is 18ft. long; it is tied as tightly as possible at short intervals, and the usual diameter is 9in. Similar bundles of wood formed part of the foundations of the early lake-dwellings, and in modern engineering fascines are used in making rough roads over marshy ground and in building river and sea walls and breakwaters.

FASCISM (*făsh'izm*), the Italian Fascist movement, dates officially from the foundation in March 1919 by Benito Mussolini (*q.v.*), then editor of *Il Popolo d'Italia*, of the first *Fascio*

di Combattimento at Milan, although many of its ideas had been inspired by the Nationalist movement dating from 1910, and by Syndicalism, of which Mussolini himself had been a leader. This first Fascio was composed of some 150 of Mussolini's friends who had supported his interventionist action at the beginning of the World War, mostly ex-Socialists of the Syndicalist wing, and nearly all ex-combatants. The first Fascist programme was confused, demagogic and had a republican tinge, but the national patriotic note was conspicuous, and proper recognition was demanded for the men who had fought and won the war. The word *Fascio* means a bundle or bunch, and was taken to define the close union of the adherents of the movement; as an emblem, the *fascos* of the Roman lictors on a tri-colour shield was adopted.

At first the Milan Fascio only attracted a fraction of the people who opposed Bolshevism and Socialism, and it still savoured too much of Mussolini's revolutionary past to secure general support. Fascism was also inspired by a sense of exasperation at the foreign policy of the Government, which did not, the Fascists believed, defend Italian interests at the Peace Conference with sufficient firmness and dignity. This aspect of Fascism was largely the outcome of nationalism, which had first given the Italian people a sense of the importance of foreign affairs and of the necessity for colonial expansion. After D'Annunzio's evacuation of Fiume at the beginning of 1921 many of his *legionari* joined Fascism, some of whose outward manifestations and the semi-mystical character, as well as the Roman reminiscences and ritual of which, they inspired.

The Squadre.—At the elections of 1919 none of the Fascist candidates were returned. During the troubles of 1919 and most of 1920 Fascism as an organization played but a small part. But the Fascist idea was spreading all over Italy, and during the municipal elections held in many cities in the late autumn of 1920 the Fascists collaborated with the other anti-Socialist parties, and in several instances formed with them national blocs, which defeated the Reds. In the Bologna riots (Nov. 1920), which broke out on the occasion of the inauguration of the Socialist town council, it was the Fascists who, although only 200 strong, organized the reaction and brought about the rapid collapse of the "Red" organizations, first in that city and after throughout the lower Po valley. The first armed Fascist *squadre* were now formed for the defence of the nation against what they considered revolutionary tyranny. The *squadre* consisted of young men, mostly ex-combatants, many of them decorated for valour and adorned with wound badges; of others too young to have served in the war, and of not a few older men, made desperate by the spectacle of their country, victorious in the war, but now browbeaten by a factious minority. There was as yet no real Fascist doctrine beyond this vague sense of outraged patriotism. The *squadristi* were mostly armed with cudgels, although many possessed revolvers and carbines, for at that time a large number of ex-service men had brought back arms of some sort from the war. Another weapon, a novelty in partisan conflicts, was castor oil, large doses of which were administered to recalcitrant Socialists and Communists, and sometimes even to other opponents of Fascism. During 1921 and 1922 encounters between Fascists and the Reds were of almost daily occurrence. In that period many hundreds of Fascists fell victims to their opponents, but their comrades were not slow to avenge these outrages. When early in 1921 the Communists broke away from the Maximalist Socialist Party and indulged in a series of murderous outbreaks, the Fascist reprisals were ruthless.

The bravery and devotion to an ideal of the *squadristi* was extraordinary. At a time when armed Communists were ready to attack anyone wearing the Black Shirt or the Fascist badge, these youths marched on regardless of danger, ready to sacrifice their lives for the national cause. Even orthodox Liberals, Catholics and others supported Fascism, in which they saw the only hope for the salvation of the country from chaos. Many adhered to the movement for selfish reasons—landlords and manufacturers who simply regarded it as a form of protection for the rights of property which the Government allowed the seditious elements to violate with impunity, and others became Fascists out of a spirit

of adventure, to secure positions for themselves or for other personal reasons. But the immense majority were inspired by genuine patriotism.

A Mass Movement.—In its early days the movement was unconnected with any particular labour policy, although Syndicalists were among its founders; later, individual workmen, peasant-proprietors and farm hands joined it individually; but, with the success of the Fascist campaign against the Red organization in the Po valley at the end of 1920 masses of workers became Fascists, and often whole unions came over in a body. This development changed the character of Fascism, and converted it into a mass movement. At the elections of May 1921, held under the auspices of Signor Giolitti, 38 Fascists were returned, including Signor Mussolini himself, and ten Nationalists. In the new chamber the Fascists and Nationalists formed a fighting band of vigorous youths strenuously opposed to the "Reds"—a nucleus which gathered around its standard members of other patriotic parties. At the Fascist congress in Rome in Nov. 1921 a review of the Fascist forces was held, and Fascism was constituted as a regular political party, the *Partito Nazionale Fascista*, and its statutes were then drafted.

THE PROGRAMME OF THE FASCISTS

The programme of the Fascists differs from those of other parties, as it represents for its members not only a rule of political conduct, but also a moral code. The programme states that "the nation is not merely the sum total of living individuals, nor the instrument of parties for their own ends, but an organism comprising the unlimited series of generations of which individuals are merely transient elements; it is the synthesis of all the material and non-material values of the race." The State must be reduced to its essential functions as a legal and political organ, the powers of parliament limited to questions concerning the individual as a citizen and the State as the organ for realizing the interests of the nation, whereas the activities of individuals as producers should be dealt with by technical councils. Trade unions must be encouraged as a means of developing production, but they should not arbitrarily level all capacities. The prestige of the State must be restored at all costs. The national finances must be placed on a sound basis, free from all traces of demagoguery. Fascism recognizes the social functions of private property, proposes a system of State discipline over class conflicts, and demands that both employers' and workmen's organizations shall be legally recognized and invested with responsibility; no strikes in the public services are to be tolerated. The State should restore to private enterprise all industrial undertakings which it has proved incapable of running. In foreign affairs Italy must "reaffirm her right to complete historic and geographic unity, and fulfil her mission as the bulwark of Latin civilization in the Mediterranean." The party is indissolubly bound up with its *squadre*—the volunteer militia at the service of the State. It was this congress that declared that Fascism would supplant the State whenever the State should prove incapable of suppressing the elements of disorder.

The organs of the party are: the Directorate—the executive organ, composed of the general secretary and ten other members elected by the national council; the central committee, composed of the various district delegates and the members of the Directorate, elected by the national council for a year and entrusted with the conduct of the political and administrative action of the Fasci and with disciplinary authority; the national council, composed of members of the central committee and the provincial secretaries, and invested with controlling authority over the Fasci; the general secretariat, nominated by the national council; the Fasci, or local sections of the party, all the Fasci of a province constituting a provincial federation; the *squadre de combattimento*, afterwards converted into the National Militia; the parliamentary group, composed of the Fascist members of parliament; the various auxiliary groups, such as the women's *Fasci*, the *Avanguardie*, the *Balilla*, etc.; the congress, composed of delegates of the provinces, which meets at irregular intervals to express the views of Fascism as a whole. The general conception of Fascism is based on rigid hierarchy.

Attitude to Monarchy.—Fascism had been gradually shedding its demagogic elements, and at Udine, on Sept. 29, 1922, Mussolini expressed his adherence to the monarchy, thereby securing widespread support for Fascism among many who had hesitated on account of its "implicit republican tendency." Fascism has ended by becoming the strongest bulwark of the monarchy, because, unlike other monarchical parties, it has no need to conciliate the revolutionary elements.

ITALY UNDER THE FASCIST GOVERNMENT

When Fascism came into power (Oct. 28, 1922), Signor Mussolini, although rejecting alliances with other parties, accepted their collaboration, and admitted several of their members into his first cabinet. Nationalism was absorbed by Fascism early in 1923, but as the Opposition became more violent in its attacks, especially after the Matteotti murder, the party tended to concentrate more and more on itself, satisfied with its own strength and the general approval of public opinion, not attached to any party; and it still has millions of supporters who are not Fascists. The party underwent certain changes in its constitution, among which the most important were the fusion with Nationalism and the creation of the Fascist grand council. This body, which sums up, co-ordinates and directs all the activities of the party, is composed of the prime minister as chairman, and all the members of the Cabinet, with the general secretary of the party and certain other party officers both central and local. At its meetings the opinion of Fascism in the direction of various legislative reforms is manifested, and the proposals voted are then submitted to the cabinet. Although party and Government are separate, the connection between the two is very close, as Signor Mussolini is at once the head of the Government and the leader of the party. (For the transformation of the grand council into an organ of the State see ITALY: History.)

Relations with the Vatican.—Fascism, since it has become the Government of Italy, has shown a marked sympathy for Catholicism, which as the religion of the vast mass of the Italian people is regarded to some extent as a national institution. After long negotiations with the Vatican the Italian Government, in Feb. 1929, agreed to surrender a small territory to the pope as absolute temporal sovereign, and thus ended an *impasse* which had troubled Italian politics since 1870 (see further PAPACY).

Fascist Aims.—The Fascist tendency to isolate itself and reject alliances with other parties was steadily advocated by Roberto Farinacci (*q.v.*) after his appointment as general secretary early in 1925. After the Matteotti trial in March 1926, he resigned his appointment, having accomplished the task of reorganizing the party, and was succeeded by Augusto Turati. The party directorate was also changed. But the general character of Fascism remains unaltered. Its aim is to get its main principles generally accepted by the nation and embodied in a series of legislative reforms which shall make of Italy an essentially national State, as opposed to the pre-existing Liberal State, wherein the seditious elements were free to conspire against the general welfare in the interests of class or clique. These reforms comprise the restoration of national finance, the reorganization of the bureaucracy in the interests of efficiency, the reform of education, the peaceable regulation of labour conflicts, the re-establishment of discipline in every department of the State and every aspect of national life, the improvement of agriculture and the progress of industry. Many of these reforms have already been carried out, and others are in progress. Opponents accuse Fascism of crushing liberty; but the Fascists reply that if the freedom of the press is limited, and parties, other than the Fascist, are reduced to inactivity, the essential liberty of the people has been secured as never before—the freedom to work and to produce for the common good—and that only a strong Government like that of Signor Mussolini could achieve such a series of necessary and far-reaching reforms, which Liberal Governments may have desired, and even attempted, but had always failed to carry out owing to the tyranny of parliamentary obstruction. The people, he said in July 1924, never asked him to free them from a tyranny which did not exist, but asked for railways, houses, roads, bridges, drains, water and light.

Fascist Doctrine.—Fascist doctrine, as it has been evolved during the last years, was authoritatively set forth by Prof. Alfredo Rocco, minister of justice, in a speech at Perugia on Aug. 31, 1925. After rejecting the Liberal, Socialist and Democratic theories of the State, he declared that, according to Fascism, society does not exist for the individual, but the individual for society, although Fascism does not annul the individual as the individuals annulled society under certain older doctrines, but merely subordinates him to society, while securing his right to develop his personality. Economic progress is a social interest, but Fascism considers it best to leave the production and distribution of wealth to individual enterprise in order to secure the maximum results in the interests of the community. The social problem is not solved, however, by merely rejecting the Socialist doctrine; Fascism wishes to secure justice between classes, but class warfare must be eliminated, as it is the State which must establish justice between classes just as it does between individuals. Signor Mussolini in an article in *Gerarchia* (Oct. 1925) compares "the incessant and fertile activity of the Government with the paralysis of all the opposition parties within the chamber and without. Everyone, explicitly or otherwise, is convinced that in the Italy of 1925 Fascism alone towers like a giant." The defects of Fascism are the general defects of the Italian character: the tendency to rhetoric, *arrivismo* (excessive pushfulness of men on the make), which has been accentuated by the creation of the many party offices and appointments, often filled not by the worthiest but by the most pushful and ambitious. Of the deeds of violence occasionally committed by Fascists, usually reprisals for similar deeds committed by adversaries, Signor Mussolini wrote in the above-quoted article: "This violence does not facilitate the work of the Government, but compromises it." Fascism has gradually ceased to be a mere political party in the ordinary meaning of the term and has penetrated into and absorbed every manifestation of national activity. It is the driving force of the Government and of national life, and may to-day be described as a state of mind, and is accepted and warmly approved by millions of persons who are not registered members of the party organization.

Fascist Labour Organization.—Labour Syndicalism has become one of the most important aspects of Fascism. The first statute of the party, drafted in Dec. 1921, defined the Fascist labour corporations. Labour is declared to be the basis of human welfare and progress, and all who devote themselves to productive work are regarded as workers. Fascist Syndicalism, unlike the Socialist unions, accepts the patriotic idea, recognizes the importance of capital, and considers the fate of the worker as bound up with that of the whole nation. (Fuller details will be found in the article entitled FASCISM, ECONOMICS OF.)

The National Milizia.—Before Fascism came into power its action was largely that of the armed *squadre* and it was the 200,000 Black Shirts (though estimates of their number vary considerably), who effected the "March on Rome," enabling Fascism to become the government of the country. But once this was achieved, the existence of irregular Fascist forces was incompatible with Mussolini's intention of constitutionalizing the Fascist movement. To have disbanded them would have savoured of ingratitude, while their constituent elements might still be useful to overawe the revolutionary and anti-national parties and to consolidate the Fascist régime. At a cabinet council on Dec. 28, 1922, it was decided to disband all the *squadre*—Fascist, Nationalist, Arditi and *Legionari fiumani*, and by royal decree of Jan. 14, 1923, the *Milizia volontaria per la sicurezza nazionale* was created in their place. The force was voluntarily recruited from among the *squadristi*, the men appointed by the prime minister or the authorities delegated by him, and the officers by royal decree on the proposal of the ministers of war and of the interior. Neither officers nor men are paid, except those on permanent duty at the general or territorial headquarters (700 in all), while those who are temporarily called out for service outside their place of residence receive a daily allowance.

The total budget comes to 53,000,000 lire annually, although certain special detachments, such as the railway *milizia*, are paid for by other departments. The force, which comprises some

300,000 men, is "at the service of God and the Italian Fatherland, and takes orders from the head of the Government." Its duties are to "assist, together with the armed forces for the public safety and the army, in the maintenance of internal order and to prepare citizens for the defence of Italian interests in the world." It has relieved the army of many troublesome services, and although it has never been necessary to employ it to put down revolutionary outbreaks, its mere existence has sufficed to deter the seditious elements from such action. The organization of the *milizia* was subsequently brought into closer harmony with existing institutions; the royal decree of Aug. 4, 1924, provides that its members shall take the oath of allegiance to the king, and that the officers shall be recruited from among the reserve officers of the army, navy and air force. The force is also entrusted with the pre-military training of youths under 20; the object of this measure is to give a large part of the nation a military education without involving the country in too heavy expenditure. Three legions of the *milizia* have served with distinction in Libya.

On Oct. 25, 1927, the membership of the Fascist party and the organizations connected with it were as follows:—Fascists (regular registered members), 1,027,010; *Avanguardisti* (boys from 14 to 18 destined to become members of the party), 325,127; *Balilla* (schoolboys under 14 destined to become *Avanguardisti*), 780,937; student groups, 16,965; women Fascists, 88,083; *Giovani italiane* (corresponding to the *Avanguardisti*), 66,253; *Piccole italiane* (corresponding to the *Balilla*), 318,781; members of the workers' syndicates, 3,577,128; members of associations (civil servants, postal employees, railwaymen, teachers, etc.), 567,496; grand total: 6,814,703.

Save in a few cases of persons having rendered exceptional services, admission to the party is regularly granted only to those from the *Avanguardisti* (youths over 18 years), which means an annual addition of some 40,000.

FASCISM, ECONOMICS OF. A series of laws, decrees, and ministerial regulations, enacted since the Fascist Government came into power in Italy in Oct. 1922, has radically transformed the legislation regulating occupational and trade unions (or "syndical associations" as they are termed in Italian law), the relations between employer and employed, and representative institutions. The aim has been to replace the parliamentary régime existing in Italy since attaining unity in 1870 by a "corporative" or guild state.

Basis of System.—The basic act of the new system is that of April 3, 1926, regulating the legal and economic representation of employers and workers in all industries (including agriculture), trades and professions. For each category of employers

and for the corresponding category of workers (manual and non-manual) the law provides that syndical associations may be formed and incorporated. Such associations must represent not less than 10% of the persons engaged in the business, profession or trade concerned in the territory for which they are formed; they must be organised to protect not only the economic but also the moral, educational and professional interests of their members; and their directors must be persons who afford guarantees of capacity, honesty and patriotism. The activities of the associations must never run counter to the national interest and they may not be affiliated to international bodies without the express consent of the Ministry. Unrecognised unions may continue to exist as *de-facto* associations.

The incorporated associations are the authorised representatives of the category for which they are formed in (1) the stipulation of wage and work agreements, (2) disputes brought before the labour courts, (3) nominating members to sit on the many boards, councils and commissions, which form the representative organs of the guild State. The collective agreements on wages and conditions of work stipulated by these associations become binding on all employers and workers for the area and occupation concerned, whether they be members or not, the associations becoming civilly responsible for carrying out the terms of what is, in fact, a legal contract.

The act contemplates the formation of such associations for all branches of production and all forms of activity, with the exception of the civil services, State industries such as the railways, local government services, and public charities, employees in connection with which are otherwise provided for. All forms of association are forbidden in the case of the armed forces of the State, magistrates, university professors, and the staff of the Ministry of Foreign Affairs. With the above exceptions, membership of the incorporated associations is open to "all Italian citizens engaged in the occupations represented, of both sexes, of not less than 18 years of age, and of good moral and political conduct." Membership of the associations is voluntary, but the conditions they secure for their members are extended to all non-members similarly occupied. Collective bargaining through legally recognised representative organs being thus provided for and given contractual force, it was logical that provision should be made for the settlement of disputes arising between organised employers and workers. To this end the act provides that, failing settlement by conciliation, disputes be deferred to the ordinary courts of appeal acting as labour courts (*magistratura del lavoro*), the judges being assisted by experts selected from panels drawn up by the respective syndical associations. The verdict of the court is final, and strikes and lock-outs are alike illegal and punishable by heavy fines, and in certain cases by imprisonment.

Supreme National Expression.—The whole system has as its premise that the intensification of production is not only a national interest which the State, as the supreme expression of national life, must safeguard; but that it is in like degree the interest of the employers and the employed. The recognition of this essential identity of interest differentiates Fascist from Socialist trade unionism; it also explains the different aims and diverse methods of the two schools of economic thought. Socialist trade unionism works through the class struggle; Fascist syndicalism works through class collaboration and aims at organizing the guild state in which all the factors of production—capital, scientific research, technical direction, manual and clerical labor—are recognized as essential each in their degree, their several interests being conciliated and subordinated to the general or national interest of which they are an integral part. The theory and practice of Fascist economics derives from a conception of the State not as a mere policeman keeping order and seeing fair play, not as an instrument at the service of a party or a class, not as a force dominating but apart from the people, but as the supreme expression of all forms of national life, to which none of its activities are extraneous. "All within the State, nothing outside the State, nothing against the State" is the formula in which the leader of Fascism—Mussolini—expresses this conception which, in the early days of the Fascist labour movement,

led to the foundation of "mixed" syndical associations, representative of both employers and workers. Experience showed this to be impracticable, and the act of April 1926 gave legal recognition to separate though parallel associations, the subsequent formation of joint guilds being, however, foreseen, and the whole system placed under the newly created Ministry of Guilds (*corporazioni*).

The Guilds.—The guild feature of the system is developing under the direct control of this Ministry. National guilds, affording equal representation to employers and employed, under a chairman appointed by the minister, are formed for the several branches of productive and business activity. Their main duties are to study the organization and development of the industries they represent with a view to securing greater co-ordination and simplification so as to reduce production costs and intensify output. The scientific organization of production is as much an interest of the workers as of the employers, and the guilds afford them an opportunity of expressing their views and recording their vote on a footing of full equality. They may be described as permanent deliberative and advisory bodies, on a representative basis, in direct touch with the Government, appointed for the study of all phenomena affecting the prosperity of an industry. The guilds also act as boards of conciliation in trade disputes before they are referred to the labour courts; they organize employment bureaus (the only ones sanctioned) placed under the joint control of employers and workers; and regulate the conditions of vocational training and apprenticeship. The Minister of Guilds is assisted by a National Guild Council on which sit representatives of the several government departments, of the syndical confederations, and of the national educational and welfare works—*Dopolavoro*, *Balilla*, and *National Institute for the Protection of Maternity and Childhood*.

Regulations.—The regulations for the enforcement of the act provide (1) for the formation of syndical associations for each category of employers or workers, known as first grade associations; (2) for their federation in provincial unions (second grade associations); and (3) for the federation of these unions in national federations (third grade associations), grouped (4) into seven confederations. Within this general framework considerable elasticity is allowed to meet varying conditions. The organization adopted is generally twofold: (a) geographical, all the associations of a province or a zone being grouped in a union, (b) occupational, separate federations covering the whole territory being formed for each industry or occupation.

Employers' Organizations.—There are six confederations for employers of labour, with whom are grouped the syndical associations of works' engineers and managers, assimilated by their responsibility for the success of the concern to their employers. These confederations are: (1) The *General Fascist Confederation of Italian Industries*, to which are affiliated the provincial unions, grouping together all the industrial employers' associations of each province and the National Federations for each industry. (2) The *National Fascist Confederation of Agriculture*, to which are affiliated the provincial federations of the three syndical associations representing operating land-owners, non-operating land-owners, and owners renting their lands. (3) The *National Fascist Confederation of Commerce* to which are affiliated provincial federations of all the syndical associations, and national federations formed for each category. (4) The *General Fascist Confederation of Bankers*, to which are affiliated national associations for each category of banks. (5) The *National Fascist Confederation of Land and Inland Water Transport*, to which are affiliated regional associations, and national federations for each category. (6) The *National Fascist Confederation of Sea and Air Transport*, to which are affiliated inter-regional federations for the ship owners and one national federation of air-transport employers.

Workers' Organizations.—Manual and non-manual workers are represented by national federations corresponding to the above, but united in one *National Confederation of Fascist Syndicates*. An exception is made for sea and air-transport workers organized in an *Autonomous Federation*. An *Autonomous Federa-*

tion of Artisans is affiliated to the general confederation of industries (employers); and a *National Federation of Intellectual Workers* groups together 16 national syndical associations for a like number of professions and is affiliated to the national confederation of Fascist syndicates (workers). The federations and confederations appoint their own officers, subject to the approval of the Ministry of Guilds.

Financial Arrangements.—Under the provisions for the enforcement of the act the necessary funds are secured by levying annually from all employers the equivalent of one day's pay for every worker in their service. Workers, whether members of the associations or not, also contribute one day's pay per annum collected by their employers. During the first year in which the act was in force (1927) £150,870,000 were thus secured and the system is expected to yield considerably more in the future. When it is not practicable to collect a day's pay the contribution takes the form of a fixed percentage of the land or income tax. Of the funds thus collected 10% are deposited with the Bank of Italy as surety for the fulfilment of contractual obligations; 10% go to the Ministry to meet the cost of the guild organization; a further percentage is assigned to the welfare and education work contemplated under the act; the remainder, for the working expenses of the syndical associations, federations and confederations.

Status of Public Employees.—In the system above described the workers' organizations are placed at all stages on a footing of entire equality with those of their employers. Such equality cannot exist in the relations between the State and local government bodies and their staffs, who are represented by the officially recognized *General Fascist Association of Public Employees*, entitled to representation on several of the advisory and consultative bodies recently created in connection with the system, and on the educational and welfare activities of the Guild State.

The Labour Charter.—This document, issued by proclamation on April 21, 1927, sets forth Fascist labour policies. It asserts the subordination of individual to national interests, proclaims work to be a social duty, recognizes private initiative as "the most effective instrument of production" but holds the organizers of industry responsible to the State for results. Workers are to be considered as active partners in the enterprise, the direction and management of which is, however, vested solely and unequivocally in the employer. The conditions which must regulate labour contracts are laid down and the right of the workers to Sunday rest and a paid annual holiday asserted. The worker dismissed for no fault of his own is entitled to compensation and on his death a sum is due to his family. Illness, unless prolonged beyond certain fixed limits, does not justify dismissal. Employers must engage their workers through the labour exchanges opened under the control of the Ministry of Guilds. The charter proclaims the intention of the Fascist State to perfect accident and maternity insurance, to enact sickness insurance (as a first step compulsory insurance of industrial workers against tuberculosis has been enacted), to perfect unemployment insurance and introduce special forms of dowry insurance for young workers. The provision of education and recreational facilities and of vocational training is among the chief duties of the syndical associations.

Representative Institutions.—The outstanding feature of Fascist economics is the representative, advisory and consultative functions assigned to the federations and confederations of the syndical associations which are represented on (1) the grand council of the Fascist Party, (2) the superior economic council, (3) the 92 provincial economic councils, (4) the municipal boards (*consulte*), (5) the central committee on prices, costs and wages, (6) the inter-syndical provincial committees for price, cost and wage adjustments, (7) the boards of experts assisting the labour courts. The act of May 17, 1928, reforming parliamentary representation assigns to the 13 national confederations and federations, jointly with other corporate bodies and associations of national importance, the duty of nominating the candidates from whom the grand council of the Fascist Party selects the list of names submitted to the nation for election. Payment of the dues levied under the act of April 3, 1926, entitles the male citizen to a vote.

Position in 1928.—By the end of 1927 all categories of employers and workers were represented by incorporated associations, and the next stage of the work, that of forming the guild organizations, was taken in hand. In March 1928 the membership of the workers' syndical associations stood at 2,809,461; that of the employers' at 885,968. When the first national congress of manufacturers was called by the general confederation of industries in June 1928 the president announced that the manufacturers' syndical associations were organized in 49 national federations, representing 66,557 firms, employing 1,750,000 persons, *i.e.*, 70% of Italian manufacturers employing 82% of industrial workers; besides these 355,000 artisans were affiliated to the confederation. At that date 2,435 national, 101 regional and inter-provincial, and 2,289 provincial trade agreements had been signed between employers and workers under the new laws. The activities of the inter-syndical committees on prices and wages proved valuable in overcoming the economic difficulties consequent on currency and credit deflation and monetary revalorization, which entailed extensive readjustments of wages, prices and farm rents. In the revision of these latter no fewer than 31,120 cases were submitted to them for adjustment; while in the matter of wage disputes the fact that in spite of the exceptional difficulties of the situation it has only been found necessary to defer two cases of some importance for settlement to the labour courts (those of the rice workers and of the seamen, in both of which the verdict of the courts upheld the claims of the workers) shows how successful the syndical associations have been in conciliating what apparently were conflicting interests.

(O. R. A.)

FAST AND LOOSE, a cheating game played at fairs by gypsies and sharpers. A strap, usually in the form of a belt, is rolled or doubled up with a loop in the centre, and laid edgewise on a table. The showman then bets that the loop cannot be caught with a stick or skewer as he unrolls the belt. As this looks to be easy to do the bet is often taken, but the sharper unrolls the belt in such a manner as to make the catching of the loop practically impossible. *Cf.* Shakespeare in *Antony and Cleopatra* (iv. 12):—

Like a right gipsy, hath, at fast and loose,
Beguiled me to the very heart of loss.

From this game is taken the colloquial expression, "To play fast and loose."

FASTI, the plural of the Latin adjective *fastus*, but more commonly used as a substantive (derived from *fas*, meaning what is allowable by divine law). *Fasti dies* came to mean the days on which law business might be transacted without impiety, corresponding to our own "lawful days." The word *fasti* itself then came to be used to denote lists or registers of various kinds, which may be divided into two great classes.

1. *Fasti Diurni*, divided into *urbani* and *rustici*, an official year-book, with dates and directions for religious ceremonies, market-days, etc. Until 304 B.C. the lore of the *calendaria* remained a monopoly of the priesthood; but Gnaeus Flavius then published the forum tables containing the requisite information. This list was the origin of the public Roman calendar. Ovid's *Fasti* is a poetical description of the Roman festivals of the first six months, written to illustrate the *Fasti* published by Julius Caesar after he remodelled the Roman year.

2. *Fasti Magistrales*, *Annales* or *Historici*, were concerned with everything relating to the gods, the emperors, etc., and the feasts and ceremonies established in their honour. They came to be denominated *magni*, by way of distinction from the bare calendar, or *fasti diurni*. Of this class, the *fasti consulares* were a chronicle of events in which the several years were denoted by the respective consuls. The *fasti triumphales* contained a list of persons who had obtained a triumph. The word *fasti* thus came to be used in the sense of "historical records." A famous specimen of this class is the *fasti Capitolini*, so called because deposited in the Capitol by Alexander Farnese, after their excavation from the Roman forum in 1547.

A considerable number of *fasti* of the first class have been discovered; but none older than the time of Augustus. The Prae-

nestine calendar, arranged by the famous grammarian Verrius Flaccus, contains the months of January, March, April, and December, and a portion of February. The tablets give an account of festivals, as also of the triumphs of Augustus and Tiberius. Some kinds of *fasti* included under the second general head were, from the very beginning, written for publication. The *Annales Pontificum*—different from the *calendaria* properly so called—were annually exhibited in public on a white table, on which the memorable events of the year, with special mention of the prodigies, were set down in the briefest possible manner. In fact, all the state offices had their *fasti* corresponding in character to the consular *fasti* named above.

BIBLIOGRAPHY.—For the best text and account of the fragments of the *Fasti* see *Corpus Inscriptionum Latinarum*, i. (2nd ed.); on the subject generally, Teuffel-Schwabe, *Hist. of Roman Literature*, §§ 74, 75, and J. E. Sandys, *Companion to Latin Studies* (1921).

FASTING, in the strict sense of the word, denotes complete abstinence from food and drink; but it is commonly applied also to the use of a diet somewhat severely limited, either by the rejection of certain customary kinds of food or by a diminution of the total quantity of food consumed. Fasting, in the former sense, is generally required in preparation for a surgical operation; in the latter sense it is often recommended for health's sake, and is voluntarily undertaken by many. Occasionally an individual will keep a prolonged fast, in the stricter sense, as a public view, in order to earn the reward of entertainment by giving a demonstration of unusual vitality. In recent times fasting has been used as a means of protesting against the alleged injustice of the law of the land, and even of defeating that law, the hunger-strike being practised with such persistency that it has led either to the release of the protesting prisoner or to his death. A close resemblance is to be seen between this modern application of the practice of fasting and an older use of it as an expression of overmastering desire and stern intention in the quest of justice. Thus men of different lands and ages have bound themselves by an oath to take no food until they have performed some act of revenge for their own honour, or for the sake of their people (*cf.* Acts xxiii. 12); and among the Celts it was not uncommon for a man who was refused a lawful request, to "fast against" the one who had denied him his right, so as either to persuade him to an act of justice or to bring upon his head the blood of the oppressed.

Commonest by far, however, of all the uses of voluntary fasting, in the past and at the present time, is its practice as an act of self-denial with definite religious intention. By the greater number of religions, in the lower, middle, and higher cultures alike, fasting is largely prescribed; and where it is not required it is nevertheless practised to some extent by individuals in response to the promptings of nature.

I. Religious Sanctions and Regulations.—Fasting is practised by all the peoples of the lower cultures, in which it is supported by the rudimentary science which takes the form of magical lore, as well as by a variety of crude religious beliefs. Special discipline is laid upon medicine-men and other experts, for the perfecting of their abnormal powers and for the ready performance of their peculiar tasks. But when danger threatens in all its many forms, fasting is required of individuals, of groups, and of the whole community, for the avoidance of various hostile influences; and the fear of punishment at the hands of the tribal authorities (including the gods), and, still more, of automatic results of a terrible nature, is sufficient to secure the strictest obedience.

Among the religions of intermediate development, now extinct, that of the Celts laid some stress on the practice of fasting, while the religion of the Teutons appears to have found little or no place for it. The ancient Mexicans and Peruvians resembled the Babylonians and Assyrians in that fasting was largely used by them in connection with penance and the offering of sacrifice; and, though the records do not show that fasting bulked very large in the religious life of the ancient Egyptians, there are clear indications of its use. The Romans appear to have used the practice but little until they came under the influence of the later Greek religion, in which fasting was required of all initiates by the guardians

of the mystery-religions, and recommended to individuals by philosophers of various schools, Cynics, Stoics, Pythagoreans, and Neo-Platonists.

In the Far East, Hindu and Jain ascetics are committed by their faith to very severe fasting in conjunction with numerous other austerities; and abstinence in lesser degree is imposed upon Hindus generally by the requirements of caste-law, and by the performance of due accompaniments of pilgrimages and of preparation for certain festivals. Primitive Buddhism recommends moderation rather than extreme self-deprivation; but in practice in its various developed forms the religion covers a considerable amount of fasting, especially in Tibet, in direct contradiction of the Buddha's teaching. The higher Taoism of China imposes periods of strict abstinence upon its professors; and Confucianism has followed the practice of its great expounder in approving the customary observance of fasting as a preparation for the worship of ancestral spirits.

Judaism requires an annual fast on the Day of Atonement. For a long time the Jews observed four other annual fast-days appointed during the Babylonian exile to commemorate the siege and destruction of Jerusalem; and a fifth day was added subsequently in remembrance of the three days' fast of Esther. Additional voluntary fasts on the part of individuals were common, and at the beginning of the Christian era, Monday and Thursday in each week were kept as voluntary fast-days by the stricter Jews (*cf.* *Lc.* xviii. 12). The Qur'ān (ii. 179 *sqq.*) requires all Muslims other than young children and idiots to observe the ninth month (Ramadān) of the year as a fast, food and drink being forbidden from sunrise to sunset during each of the 30 days. Any who are prevented from keeping the fast by sickness or by the necessity of travelling, must fast for an equivalent period at another time. Voluntary fasts are also recommended on certain days in the year; and fasts are required in recognition of responsibility for specified offences and in discharge of obligation for the same. Muslim mystics (Sūfis) and members of the darwesh orders practice much additional fasting for their special purpose of communion with the Divine.

In the Christian world there exists, at the present day, considerable diversity of opinion and practice in the matter of fasting; but on a historical survey it may be said that in no other religion has fasting been more widely approved, more rigorously required, and more extensively practised. The Founder Himself laid down no rules on the subject. He fasted (*Lc.* iv. 2); He declared that fasting would have a place in the practice of His followers (*Mk.* ii. 19 *seq.*); and He required that fasting, like the almsgiving and prayer with which it is associated, should be without ostentation (*Mt.* vi. 16 *seq.*). But it was left to the Church to prescribe the rules that were to govern the corporate practice of the fast. Out of the voluntary use of individuals there gradually arose a common mind and a common discipline, according to which a fasting preparation was required by the Church for the due observance of appointed festivals, and for the reverent reception of the benefits of Holy Baptism and Holy Communion. The preparation for the feast of Easter developed slowly from a fast of one day, 40 hours (the time during which the Lord's body rested in the tomb), two days or more, to the full 40 days of Lent; and in close association with it the pre-baptismal fast came to be required of catechumens. The fasting varied in rigour according to locality, but on the whole it involved real self-denial, and in places was literally a complete abstention from food and drink. From the 2nd century it began to be the custom in some countries to fast on Wednesday and Friday in each week, these days being known as "stations," when Christians considered themselves to be on guard. Under the influence of the Montanists this fasting increased in strictness, and by the end of the 4th century it had become a universal custom in the Church, Saturday being added to Friday as a "superposition" in many parts of the West. By the same date the fast before Communion, dictated long before this time by a growing appreciation of the full significance of the sacrament, had also become oecumenical. Dispensation from this fast, in particular, seems to have been very rarely granted, only the dying being recognized as necessarily exempt. Bishops

prescribed additional fasts for their own dioceses as occasion required; voluntary fasts were added to these obligatory acts of discipline at the discretion of individuals; and, with the growth of monastic communities from the middle of the 4th century, special fasts began to be largely used.

The Eastern Church took an independent line in the development of appointed fast-days, and its present practice differs considerably from that of the Church in the West. In Lent the Saturdays (with the exception of Easter Even) are excluded from the fast as well as the Sundays. The Fast of the Apostles lasts for a week from the octave of Pentecost, which is the Sunday of All Saints, or in some cases until June 29, which is the Feast of St. Peter and St. Paul. The fortnight before the Feast of the Repose of the Virgin, which is celebrated on August 15, is kept as the Fast of the Mother of God. The Fast of the Nativity of our Lord, beginning on November 15, lasts until Christmas, thus covering a period of 40 days. And the Wednesdays and Fridays throughout the year are fast-days. The fast before Communion is generally insisted on.

The post-Reformation Church of Rome continued to fast, as in the middle ages, during Lent, on the Ember Days and Rogation Days, on the days appointed as Vigils, and on Fridays, the Wednesday and Saturday fasts having practically lapsed; but in 1781 a reduction was made in the severity of the fasting required of the English Roman Catholics by the introduction of a distinction between fasting and abstinence. Recent years have seen further concessions, and the new *Codex Juris Canonici*, issued in 1917, shows that abstinence from flesh meat is alone required on days of abstinence, no restriction being laid upon the quantity of food taken. Days of fasting which are not marked also as days of abstinence admit of any kind of food being taken at the one full meal that is allowed, flesh meat being forbidden, however, at the two smaller meals which are permitted. The strict fast before Communion, rarely excused at all before the present century, may now be modified in the case of any who are in serious ill-health, dispensation being granted both to lay-people and to priests.

At the Reformation the Church of England included in its Book of Common Prayer a list of days of fasting or abstinence, the two terms being used synonymously, and required that notice of these days should be given in church. No directions for their observance were issued, the matter presumably being left to every man's conscience; yet there can be no doubt that the list was issued with serious intention, for provision was made by law for the granting of dispensations by the archbishop of Canterbury, by diocesan bishops, and by incumbents of parishes, according to the nature of the case (25 Hen. VII., cap. 21, 5 Eliz., cap. 5). The list includes the 40 days of Lent, the Ember-days at the four seasons, the three Rogation-days, and all the Fridays in the year, except Christmas Day. The fast before Communion was not referred to; but in the form provided in 1661 for the ministration of baptism to such as are of riper years, the first rubric states that candidates "may be exhorted to prepare themselves with prayers and fasting for the receiving of this Holy Sacrament." On the whole the practice of English churchmen after the Reformation included less and less fasting until the time of the Tractarian movement. It was never entirely lost, and there were notable revivals of the practice in the Wesleyan and Evangelical movements; but the recovery of a true sense of its earlier obligation and importance and of a steady persistence in its practice dates from the second quarter of the 19th century. Special stress has been laid by the followers of the Tractarians upon the necessity of the fast before Communion; and this, together with the evangelical opposition which it has aroused, led to the insertion in the revised Prayer Book which was presented to parliament in 1928 of a new rubric stating that "It is an ancient and laudable custom of the Church to receive this Holy Sacrament fasting. Yet, for the avoidance of all scruple, it is hereby declared that such preparation may be used or not used, according to every man's conscience in the sight of God." The new Prayer Book also revised the list of days of fasting or abstinence, excluding the Epiphany when it chances to fall on a Friday, and the Fridays

in the octaves of Christmas, Easter, and the Ascension, and adding the Vigils before the Nativity of our Lord, Pentecost, St. John the Baptist, All Saints and St. Andrew.

In the other Reformed churches and in the Free churches which have separated themselves from the Church of England, fasting has had its place; but the sense of its importance has generally diminished, and there has arisen not a little prejudice against its use.

II. Purposes of Fasting.—In any general survey of the different types of religious fasting, it is important to remember that great diversity exists between the mind and motives of men of different cultures and religions who yet do the same thing for what is ostensibly the same purpose, and that, in consequence, it is highly erroneous to suppose that the religious value of any one variety of fasting is constant in all cases that admit of being placed in that particular class.

(1.) *Purificatory Fasting.*—Under the influence of the mistaken idea that it is that which enters into a man which defiles him, the rejection of food and drink is often practised by those who would avoid every possibility of the contagion of evil at times of special importance. In the lower culture the initiation of lads and girls to adult membership of their tribe, admission to secret societies, and entry into the married state, are prefaced by a period of fasting, mainly on the basis of this idea; and the same precaution has much to do with the fasting that belongs to the ritual of mourning after a death and of preparation for the reception of sacred food. The endurance of fasting leads, sometimes, to the experience of seeing visions and hearing voices, and it is naturally adopted as a means thereto by "holy" men of all sorts who interpret the operation of the method they use with a physical or a psychological emphasis according to their understanding. Again, fasting is practised as a preparation for spiritual and sacramental communion, because the spirit is intent on its guest. For the sake of its own purgation and freedom of activity, it subordinates the desire for bodily food to the craving for spiritual sustenance. This is the ultimate basis of the Christian fast of purification before Communion. It is not prompted by a Manichaean conception of matter, but is due solely to concentration on the things of the Spirit and an ancillary rejection for the time being of the means of physical life. Thus, in the Church of England homily "of Fasting" the second "end" specified is "that the spirit may be made more earnest and fervent to prayer"; and Hooker says (Eccl. Pol. v. 72) that the object of fasting is "to temper the mind, lest contrary affections coming in place should make it too profuse and dissolute."

(2.) *Sympathetic Fasting.*—The practice of fasting after a death is complex in its origin and significance. It may be connected with the sacrifice involved in making provision for the dead; it may have to do with the placation of the ghost; it may be purificatory, or it may be a contradiction of normal practice intended to sever connection with the departed; but in most cases it is undoubtedly to be regarded also as an expression of grief, whether formal or sincere. Such sympathetic fasting becomes a recurring practice in the case of a saint or deity who has conferred benefits and is to be duly honoured. Thus March 24 was observed as a day of fasting and mourning in the ritual of the Mater Magna, in memory of the mother's grief for Attis; the Shi'ah Muslims similarly commemorate the martyrdom of 'Ali and his two sons, Hasan and Husain; and the Christian observance of Lent is largely inspired by the thought of fellowship with Christ in His suffering during the 40 days in the wilderness and during the events leading to His death.

(3.) *Penitential Fasting.*—In the minds of wrongdoers who are suffering or anticipating the reward of sin and convicted by their consciences, fasting serves to attest the genuineness of their repentance, to turn aside the wrath of the offended gods, and either to forestall and cancel at an easy rate the punishment due to them, or to denote a readiness to accept whatever is right, if only reconciliation may be had. At the lowest there is a large element of commercialism; at its best it is the expression of a truly contrite heart, and is associated with "prayers and supplications" and with "strong crying and tears." Such penitential fasting is found particularly in Jewish and Christian practice; and it may be said

of all Christian restraint in the matter of food and drink that it partakes of this character.

(4.) *Meritorious Fasting.*—The fasting that is undertaken in order to obtain reward or to secure power is sometimes held to work magically, as in the Intichiuma ceremonies of the tribes in Central Australia, where fasting is practised for the increase of the totem food supply. Or again, it is a personal appeal for favour, as when Jain girls fast in order to win a good husband and a happy married life. Both ideas are mingled in the fasting which is practised as a means of gaining power to exorcise evil spirits and to secure the "holiness" which is the reward of works of supererogation.

(5.) *Disciplinary Fasting.*—This figures in those religions attaching great importance to moral conduct, and it is regarded as a reasonable and useful practice, even by those who consider all other forms of fasting to be misconceived and vain. When it is undertaken as a reaction from surrounding voluptuousness, and in protest against prevailing licence, it is apt to be unduly severe; but normally it is a reasonable part of the soul's preparation for the maintenance of self-control in times of strong temptation. The Lenten discipline of Christians is shared by not a few to whom its religious significance makes no appeal, solely because they recognize its moral value.

III. Criticism and Rejection of Fasting.—Fasting may be an irksome discipline, and there are many who, having absolved themselves from its practice, find reasons why it is no longer required.

Thus, it is frequently urged that the strenuous conditions of modern life make it practically impossible, and that the use of frequent and light meals renders unnecessary a discipline which was, perhaps, of some service when men ate less frequently but more immoderately. The plea of difficulty and inutility may be reinforced by arguments drawn from quite a different quarter. Zoroastrianism taught that "he who fasts commits a sin," for he rejects that which is good, in so doing he tortures in himself another part of the good creation, and he weakens himself for the conflict with evil which is his proper work. Protests have also been made in the name of true religion by Old Testament prophets and early Christian writers, who have resented the abuse of fasting as a formal and merely external act, unblushingly offered as the accompaniment of an immoral life. "Behold, in the day of your fast ye find your own pleasure, and exact all your labours. Behold, ye fast for strife and contention, and to smite with the fist of wickedness: ye fast not this day so as to make your voice to be heard on high." (Isai. lviii. 3 *seq.*) To the rebuke of the religious critic may be added the unfavourable verdict of some who regard the matter from medical and psychological standpoints, doubt as to the wisdom and efficacy of fasting as an aid to devotion and self-control being seriously increased by the citation of numerous cases in which physical and mental evil has resulted from excess.

In spite of such criticism the practice of fasting persists, and it is likely to continue so long as men are capable of religious and moral aspiration. For it has the authority of very widespread use from time immemorial; it is supported by ecclesiastical authority in by far the greater part of Christendom, and, above all, it is rooted in some of the strongest emotions incident to human nature. There will always be the few who practise fasting rigorously, according to the strict interpretation of the term; the many will no doubt continue, according to a growing fashion, to regard *fasting* as a term which covers self-denial in general, and will impose it upon themselves in a variety of forms, including the discipline of some sort of abstinence in respect of food and drink at stated times. (O. H.)

FASTOLF, SIR JOHN (d. 1459), English soldier, in some part the prototype of Shakespeare's Falstaff, was the son of a Norfolk gentleman, John Fastolf of Caister and is said to have been squire to Thomas Mowbray, duke of Norfolk, before 1398. He served with Thomas of Lancaster in Ireland during 1405 and 1406, and in 1408 made a fortunate marriage with Millicent, widow of Sir Stephen Scrope of Castle Combe in Wiltshire. In 1413 he was serving in Gascony, and took part in all the subse-

quent campaigns of Henry V. in France. He must have earned a good reputation as a soldier, for in 1423 he was made governor of Maine and Anjou, and in February 1426 created a knight of the Garter. But later in this year he was superseded in his command by John Talbot. On Feb. 12, 1429 when in charge of the convoy for the English army before Orleans he defeated the French and Scots at the "battle of herrings." On June 18 an English force under the command of Fastolf and Talbot was defeated at Patay. According to the French historian Waurin, who was present, the disaster was due to Talbot's rashness, and Fastolf only fled when resistance was hopeless. Other accounts charge him with cowardice, and John of Bedford at first deprived him of the Garter, though after inquiry he was honourably reinstated. This incident was made unfavourable use of by Shakespeare in *Henry VI.* (pt. i. act. iv. sc. i.). Fastolf continued to serve with honour in France, and was trusted both by Bedford and by Richard of York. He returned home in 1440, when past sixty years of age. But the scandal against him continued, and during Cade's rebellion in 1451 he was charged with having been the cause of the English disasters through minishing the garrisons of Normandy. In his later days he showed himself a grasping man of business. A servant wrote of him:—"cruel and vengible he hath been ever, and for the most part without pity and mercy" (*Paston Letters*, i. 389). He had large estates in Norfolk and Suffolk, and a house at Southwark, where he also owned the Boar's Head Inn. He died at Caister on Nov. 5, 1459. There is some reason to suppose that Fastolf favoured Lollardry, and this circumstance with the tradition of his braggart cowardice may have suggested the use of his name for the boon companion of Prince Hal, when Shakespeare found it expedient to drop that of Oldcastle. In the first two folios the name of the historical character in the first part of *Henry VI.* is given as "Falstaffe," not Fastolf. Other points of resemblance between the historic Fastolf and the Falstaff of the dramatist are to be found in their service under Thomas Mowbray, and association with a Boar's Head Inn. But Falstaff is in no true sense a dramatization of the real soldier.

The facts of Fastolf's early career are to be found chiefly in the chronicles of Monstrelet and Waurin. For his later life there is much material, including a number of his own letters, in the *Paston Letters*. There is a full life by W. Oldys in the *Biographia Britannica* (1st ed., enlarged by Gough in Kippis's edition). See also Dawson Turner's *History of Caister Castle*, Scrope's *History of Castle Combe*, J. Gairdner's essay *On the Historical Element in Shakespeare's Falstaff*, ap. *Studies in English History*, Sidney Lee's article in the *Dictionary of National Biography*, and D. W. Duthie, *The Case of Sir John Fastolf and other Historical Studies* (1907).

FAT, the name given to certain animal and vegetable products which are oily solids at ordinary temperatures, and are chemically distinguished as being the *glyceryl esters* of various fatty acids. (See the article OILS, FATS AND WAXES.) Fat is a normal constituent of animal tissue, being found even before birth; it occurs especially in the intra-muscular, the abdominal, and the subcutaneous connective tissues. In the vegetable kingdom fats especially occur in the seeds and fruits, and sometimes in the roots. Physiological subjects concerned with the part played by fats in living animals are treated in the articles, CONNECTIVE TISSUES; NUTRITION; CORPULENCE; METABOLIC DISEASES.

FATALISM, strictly the doctrine that all things happen according to a prearranged fate, necessity or inexorable decree (Lat. *fatum*, that which is spoken, decreed). It has frequently been confused with determinism (*q.v.*), which, however, differs from it categorically in assigning a certain function to the will. The essence of the fatalistic doctrine is that it assigns no place at all to the initiative of the individual, or to rational sequence of events. Thus an oriental may believe that he is fated to die on a particular day; he believes that, whatever he does and in spite of all precautions he may take, nothing can avert the disaster. The idea of an omnipotent fate overruling all affairs of men is present in various forms in practically all religious systems. Thus Homer assumes a single fate (*Μοῖρα*), an impersonal power which makes all human concerns subject to the gods: it is not powerful over the gods, however, for Zeus is spoken of as weighing out the fate of men (*Il.* xxii. 209, viii. 69). Hesiod has three Fates

(*οἰραὶ*), daughters of night, Clotho, Lachesis and Atropos. In Aeschylus fate is powerful even over the gods. The Epicureans regarded fate as blind chance, while to the Stoics everything is subject to an absolute rational law.

The doctrine of fate appears also in what are known as the higher religions, *e.g.*, Christianity and Mohammedanism. In the former the ideas of personality and infinite power have vanished, all power being conceived as inherent in God. It is recognized that the moral individual must have some kind of initiative, and yet since God is omnipotent and omniscient man must be conceived as in some sense foreordained to a certain moral, mental and physical development. In the history of the Christian Church emphasis has from time to time been laid specially on the latter aspect of human life (*cf.* the doctrines of election, foreordination, determinism). Even those theologians, however, who have laid special stress on the limitations of the human will have repudiated the strictly fatalistic doctrine which is characteristic of oriental thought and is the negation of all human initiative (see PREDESTINATION; AUGUSTINE, SAINT; FREEWILL). In Islam fate is an absolute power, known as *Kismet*, or *Nasib*, which is conceived as inexorable and transcending all the physical laws of the universe. The most striking feature of the oriental fatalism is its complete indifference to material circumstances: men accept prosperity and misfortune with calmness as the decree of fate.

FATA MORGANA. A mirage frequently seen in the Straits of Messina, consisting of an apparent vertical elongation of an object situated on the opposite shore. See MIRAGE.

FATE. (Gr. *Moira*, *Moirai*, *μοῖρα*, *μοῖραι*.) In Homer, fate or necessity is conceived as an abstract power, *Moira* or *Aisa* (Gr. *Ἄῖσα*). Both words indicate "apportionment." *Moira* is sometimes apparently identified with Zeus, sometimes differentiated from him, and is regarded as assigning to everyone his share of good and evil, although he may increase the latter by his own folly. This is a nascent philosophical conception; a mythological tone is found in a few passages in which it is said that some one shall "suffer such things as *Moira* (or *Aisa*, or the Klothos, *i.e.*, the spinners) span upon the thread at his birth" (*Iliad*, xxiv. 210, xx. 127; *Odyssey*, vii. 197). With this the usual account agrees; the *Moirai* are spinners, generally conceived (but not represented in classical art) as very old women, three in number and often named Klotho (spinner), Lachesis (she of the lot) and Atropos (inflexible). It is highly probable that they were in origin spirits of birth, not of fate, although the two notions are closely combined, destiny being decided at birth, for instance, in modern Greek and Slavonic folk-beliefs. In this capacity they appear, *e.g.*, in the legend of Meleager. Several authors fancifully assign different functions to the three *Moirai* as *e.g.*, dealing respectively with past, present and future.

In Rome, *fatum* meant the "spoken" decree, presumably of the gods, occasionally in the plural; under Greek influence, the Fata became identified with the *Moirai*. From this again came a singular *fatus* or *fata* (*e.g.*, Fata Scribunda, the birth-fairy "who writes," *sc.*, the child's destiny, Tertullian, *De Anima* 37), whence Mod. Ital. *fata*, Fr. *fée*. Another identification was with the Parcae (originally *Paricae*, from *parere*, to bring forth); this, although probably due in large part to a false etymology, *Parca* being derived from *pars* (Gr. *μοῖρα*), was not far wrong, for the Parcae really were spirits of birth, and may quite possibly therefore have been spirits of destiny also.

See especially Weizsäcker-Drexler in Roscher's *Lexikon*, s.v. *Moira*; Wissowa, *Rel. u. Kultus* (2nd ed., p. 264). (H. J. R.)

FATEHPUR, a town and district of British India, in the Allahabad division of the United Provinces. The town is 73 m. by rail N.W. of Allahabad. Pop. (1921) 14,948. The district has an area of 1,642 sq.m. It is situated in the extreme south-eastern corner of the Doab or tract of country between the Ganges and the Jumna, which respectively mark its northern and southern boundaries. The central part is almost perfectly level and consists of highly cultivated land interspersed with tracts impregnated with saltpetre (*usar*). A ridge of higher land, forming the watershed of the district, runs along it at an average distance of about 5 m. from the Ganges. The country near the banks of

the two rivers is cut up into ravines and nullahs running in all directions, and is almost entirely uncultivable. Besides the Ganges and Jumna the only rivers of importance are the Pandu, a tributary of the Ganges, and the Arind and Nun, which both fall into the Jumna.

The tract in which this district is comprised was conquered in 1194 by the Pathans; but subsequently, after a desperate resistance, it was wrested from them by the Moguls. In 1736 it was overrun by the Mahrattas, who retained possession of it until, in 1750, they were ousted by the Pathans of Fatehpur. In 1753 it was reconquered by the nawab of Oudh. In 1765, by a treaty between the East India Company and the nawab, it was made over to the Delhi emperor, who retained it till 1774, when it was again restored to the nawab wazir's dominions. Finally in 1801, the nawab, by treaty, reconveyed it to the Company in commutation of the amount which he had stipulated to pay in return for the defence of his country. In 1921 the population was 652,392. Trade is mainly agricultural, but the town of Fatehpur is noted for the manufacture of ornamental whips, and Jafarganj for artistic curtains.

FATEHPUR SIKRI, a town in the Agra district in the United Provinces of India, on the road from Agra to Jaipur. Pop. (1921) 5,173. The magnificent ruins under which the modern hamlet nestles represent one of Akbar's capitals. He founded it in 1569 as a thank-offering for the birth of a son, Selim, afterwards the emperor Jahangir, foretold by Selim Chisti, a famous Mohammedan saint. The principal building is the great mosque, which is hardly surpassed by any in India. In its courtyard, which measures 350 ft. by 440 ft., stand two tombs. One is that of Selim Chisti, built of white marble, and the windows with pierced tracery of the most exquisite geometrical patterns. The other tomb, that of Nawab Islam Khan, is soberer and in excellent taste, but quite eclipsed by its surroundings. The crowning glory of the mosque is its southern gateway, in appearance, says Fergusson, "noble beyond that of any portal attached to any mosque in India, perhaps in the whole world." The palace of Jodh Bai, the Rajput wife of Akbar, consists of a courtyard surrounded by a gallery, above which rise buildings roofed with blue enamel. A rich gateway gives access to a terrace on which were the houses of Birbal and Miriam; and beyond these is another courtyard, where were Akbar's private apartments and the exquisite palace of the Turkish sultana. Here are also the Panch Mahal or five-storeyed building, consisting of five galleries in tiers, and the audience chamber. The special feature in the architecture of the city is the softness of the red sandstone, which could be carved almost as easily as wood, and so lent itself readily to the elaborate Hindu embellishment. Fatehpur Sikri was a favourite residence of Akbar throughout his reign, and his establishment here was of great magnificence. After Akbar's death Fatehpur Sikri was deserted, within 50 years of its foundation. The buildings are situated within an enclosure, walled on three sides and about 7 m. in circumference. They are all more or less in ruins, but are now being carefully tended by the Archaeological Department.

FATHER, the begetter of a child, the male parent. The word is used of male ancestors more remote than the actual male parent, and of ancestors in general, and is the orthodox term for the First Person of the Trinity. One who stands as a spiritual parent to another is his "father," e.g., godfather, and bishops or archbishops are given the title Right or Most Reverend Father in God. In the Roman church the pope is the Holy Father, while "father" is applied to a "regular," a member of one of the religious orders, and so to a confessor, whether regular or secular, and to any Roman priest. It is also used sometimes of sub-members of a religious society or fraternity in the English church. The first founders of an institution, constitution, epoch, etc., are often called fathers, e.g., the earliest settlers of North America are the Pilgrim Fathers, and the framers of the United States constitution are the Fathers of the Constitution. In ancient Rome the members of the senate are the *Patres conscripti*, the "conscript fathers." The senior member of a society is sometimes called the father. Thus the member of the British House of Commons or of the House of Representatives in the United States, America, who has

sat for the longest period uninterruptedly, is the Father of the House. (See also **FATHERS OF THE CHURCH**.)

FATHER OF THE CHAPEL: see CHAPEL.

FATHER RIGHT: see PATRIARCHATE.

FATHERS OF THE CHURCH. The "fathers of the Church" are the great bishops and other eminent Christian teachers of the earlier centuries, who were conspicuous for soundness of judgment and sanctity of life, and whose writings remained as a court of appeal for their successors, especially in reference to controverted points of faith or practice. A list of fathers drawn up on this principle will begin with the Christian writers of the 1st century whose writings are not included in the New Testament: where it ought to end is a more difficult point to determine. Perhaps the balance of opinion is in favour of regarding Gregory the Great (d. 604) as the last of the Latin fathers, and John of Damascus (d. c. 760) as the last of the fathers of the Greek Church. A more liberal estimate might include John Scotus Erigena or even Anselm or Bernard of Clairvaux in the West and Photius in the East. The abbé Migne carried his Latin patrology down to the time of Innocent III. (d. 1216), and his Greek patrology to the fall of Constantinople (1453); but, while this large extension of the field is much to the advantage of his readers, it undoubtedly stretches the meaning of *patrologia* far beyond its natural limits. For ordinary purposes it is best to make the patristic period coterminous with the life of the ancient Catholic Church. In the West the Church enters the mediaeval stage of its history with the death of Gregory, while in the East even John of Damascus is rather a compiler of patristic teaching than a true "father."

A further question arises. Are all the Christian writers of a given period to be included among the "fathers," or those only who wrote on religious subjects, and of whose orthodoxy there is no doubt? Migne, following the example of the editors of *bibliothecae patrum* who preceded him, swept into his great collection all the Christian writings which fell within his period; but he is careful to state upon his title-page that his patrologies include the "ecclesiastical writers" as well as the "fathers" and "doctors" of the Church; and an "ecclesiastical writer" is not necessarily orthodox. It is clear that in the circumstances the terms "father," "patristic," "patrology" must be used with much elasticity, since it is now too late to substitute for them any more comprehensive terms.

By the "fathers," then, we understand the whole of extant Christian literature from the time of the apostles to the rise of scholasticism or the beginning of the middle ages. However we may interpret the lower limit of this period, the literature which it embraces is immense. Some method of subdivision is necessary, and the simplest and most obvious is that which breaks the whole into two great parts, the ante-Nicene and the post-Nicene. This is not an arbitrary cleavage; the Council of Nicaea (A.D. 325) is the watershed which actually separates two great tracts of Christian literature. The ante-Nicene age yields priceless records of the early struggles of Christianity; from it we have received specimens of the early apologetic and the early polemic of the Church, the first essays of Christian philosophy, Christian correspondence, Christian biblical interpretation: we owe to it the works of Justin, Irenaeus, the Alexandrian Clement, Origen, Tertullian, Cyprian. In these products of the 2nd and 3rd centuries there is much which in its own way was not surpassed by any of the later patristic writings. Yet the post-Nicene literature, considered as literature, reaches a far higher level. Both in East and West, the 4th and 5th centuries form the golden age of dogmatic theology, of homiletic preaching, of exposition, of letter-writing, of Church history, of religious poetry. Two causes may be assigned for this fact. The conversion of the empire gave the members of the Church leisure and opportunities for the cultivation of literary taste, and gradually drew the educated classes within the pale of the Christian society. Moreover, the great Christological controversies of the age tended to encourage in Christian writers and preachers an intellectual acuteness and an accuracy of thought and expression of which the earlier centuries had not felt the need.

The ante-Nicene period of patristic literature opens with the

"apostolic fathers," i.e. the Church writers who flourished toward the end of the apostolic age and during the half century that followed it, including Clement of Rome, Ignatius of Antioch, Polycarp of Smyrna and the author known as "Barnabas." (The term *patres apostolici* is due to the patristic scholars of the 17th century. See Lightfoot, *St. Clement of Rome*, i. p. 3; "sub-apostolic" is perhaps a more accurate designation.) Their writings, like those of the apostles, are epistolary; but editions of the apostolic fathers now usually admit also the early Church order known as the *Didachē*, the allegory entitled the *Shepherd*, and a short anonymous apology addressed to one Diognetus. A second group, known as the "Greek Apologists," embraces Aristides, Justin, Tatian, Athenagoras and Theophilus; and a third consists of the early polemical writers, Irenaeus and Hippolytus. Next come the great Alexandrians, Clement, Origen, Dionysius; the Carthaginians, Tertullian and Cyprian; the Romans, Minucius Felix and Novatian; the last four laid the foundations of a Latin Christian literature. Even the stormy days of the last persecution yielded some considerable writers, such as Methodius in the East and Lactantius in the West. This list is far from complete; the principal collections of the ante-Nicene fathers include not a few minor and anonymous writers, and the fragments of many others whose works as a whole have perished.

In the post-Nicene period the literary output of the Church was greater. Only the more representative names can be mentioned here. From Alexandria we get Athanasius, Didymus and Cyril; from Cyrene, Synesius; from Antioch, Theodore of Mopsuestia, John Chrysostom and Theodoret; from Palestine, Eusebius of Caesarea and Cyril of Jerusalem; from Cappadocia, Basil, Gregory of Nyssa and Gregory of Nazianzus. The Latin West was scarcely less productive; it is enough to mention Hilary of Poitiers, Ambrose of Milan, Augustine of Hippo, Leo of Rome, Jerome, Rufinus and a father lately restored to his place in patristic literature, Niceta of Remesiana. Gaul alone has a goodly list of Christian authors to show: John Cassian, Vincent of Lerins, Hilary of Arles, Prosper of Aquitaine, Salvian of Marseilles, Sidonius Apollinaris of Auvergne, Caesarius of Arles, Gregory of Tours. The period ends in the West with two great Italian names, Cassiodorus and Pope Gregory I., after Leo the greatest of papal theologians.

The reader to whom the study is new will gain some idea of the bulk of the extant patristic literature, if we add that in Migne's collection ninety-six large volumes are occupied with the Greek fathers from Clement of Rome to John of Damascus, and seventy-six with the Latin fathers from Tertullian to Gregory the Great. The Greek patrology contains, however, besides the text, a Latin translation, and in both patrologies there is much editorial matter.

For a discussion of the more important fathers the student is referred to the articles which deal with them separately. In this place it is enough to consider the general influence of the patristic writings upon Christian doctrine and biblical interpretation. Can any authority be claimed for their teaching or their exegesis, other than that which belongs to the best writers of every age? The decree of the council of Trent (*ut nemo . . . contra unanimum consensum patrum ipsam scripturam sacram interpretari audeat*) is studiously moderate, and yet it seems to rule that under certain circumstances it is not permitted to the Church of later times to carry the science of biblical interpretation beyond the point which it had reached at the end of the patristic period. Roman Catholic writers, however, have explained the prohibition to apply to matters of faith only, and in that case the Tridentine decree is little else than another form of the Vincentian "canon," *curandum est ut id teneamus quod ubique, quod semper, quod ab omnibus creditum est*. The fathers of the first six or seven centuries, so far as they agree, may be fairly taken to represent the main stream of Christian tradition and belief during the period when the apostolic teaching took shape in the great creeds and dogmatic decisions of Christendom. The English reformers realized this fact; and notwithstanding their insistence on the unique authority of the canon of Scripture, their appeal to the fathers as representatives of the teaching of the undivided Church

was as wholehearted as that of the Tridentine divines. Thus the English canon of 1571 directs preachers "to take heed that they do not teach anything in their sermons as though they would have it completely held and believed by the people, save what is agreeable to the doctrine of the Old and New Testaments, and what the Catholic Fathers and ancient Bishops have gathered from that doctrine."

The patristic writings are no longer used as an armoury from which opposite sides may draw effective weapons, offensive or defensive; nor on the other hand are they cast aside as the rubbish of an ignorant and superstitious age. All patristic students now recognize the great inequality of these authors, and admit that they are not free from the faults of their times; it is not denied that much of their exegesis is untenable, or that their logic is often feeble and their rhetoric offensive to modern taste. But against these disadvantages may be set the unique services which the fathers still render to Christian scholars. Their works comprise the whole literature of the Church during the decisive centuries which followed the apostolic age. They are important witnesses to the text of the New Testament, to the history of the canon, and to the history of interpretation. It is to their pages that we owe nearly all that we know of the life of ancient Christianity. We see in them the thought of the ancient Church taking shape in the minds of her bishops and doctors; and in many cases they express the results of the great doctrinal controversies of their age in language which leaves little to be desired.

BIBLIOGRAPHY.—Among the more recent and most accessible sources of information we may mention Hastings, *Encyclopaedia of Religion and Ethics* (with Index vol.), Smith and Wace's *Dictionary of Christian Biography*, Herzog-Hauck's *Realencyklopädie*, Bardenhewer's *Patrologie und Geschichte der altkirchlichen Literatur*, Harnack's *Geschichte der altchristlichen Literatur bei Eusebius und Ehrard's Die altchristliche Literatur und ihre Erforschung*. The contents of the volumes of Migne's patrologies are given in the *Catalogue général des livres de l'abbé Migne*, and a useful list in alphabetical order of the writers in the Greek *Patrologia* has been compiled by Dr. J. B. Pearson (Cambridge, 1882). Migne's texts are not always satisfactory, but since the completion of his great undertaking two important collections have been begun on critical lines—the Vienna edition of the Latin Church writers, *Corpus scriptorum ecclesiasticorum Latinorum*, and the Berlin edition of the Greek writers of the ante-Nicene period, *Griechischen christlichen Schriftstellern der ersten drei Jahrhunderte*.

For English readers there are three series of translations from the fathers, which cover much of the ground; the Oxford *Library of the Fathers*, the *Ante-Nicene Christian Library* and the *Select Library of Nicene and Post-Nicene Fathers*. Satisfactory lexicons of patristic Greek and Latin are still a desideratum: but assistance may be obtained in the study of the Greek fathers from Suicer's *Thesaurus*, the *Lexicon of Byzantine Greek* by E. A. Sophocles, and the *Lexicon Graecum supplementum et dialecticum* of Van Herwerden; whilst the new great *Latin Lexicon*, published by the Berlin Academy, is calculated to meet the needs of students of Latin patristic literature. For a fuller list of books useful to the reader of the Greek and Latin fathers see H. B. Swete's *Patristic Study* (2nd ed. 1900).

FATHOM, a measure of length, being the distance from the tip of one middle finger to the tip of the other, when the arms are stretched out to their widest extent (a word common, in various forms, to Scandinavian and Teutonic languages; cf. Danish *favn*, Dutch *vaam* and Ger. *Faden*, and meaning "the arms extended"; the ultimate origin is a root *pet*, seen in the Gr. *περὶ πῦρ*, to spread). This length has been standardized to a measure of 6 ft., and as such is used mainly in soundings as a unit for measuring the depth of the sea. "Fathom" is also used in the measurement of timber, when it is equivalent to 6 ft. sq.; similarly, in mining, a fathom is a portion of ground running the whole thickness of the vein of ore, and is 6 ft. in breadth and thickness. The verb "to fathom," i.e., to sound or measure with a fathom-line, is used figuratively, meaning to go into a subject deeply, to penetrate, or to explore thoroughly.

FATHOMETER, a device which is a practical development of the sonic or echo depth-finding principle for modern navigation purposes. This device is manufactured by the Submarine Signal Corporation in the United States, is a development of Prof. Fessenden's submarine oscillator, and produces a submarine sound, and detects the returning sound by electrical means. The fathometer system consists essentially of three parts: a sound-producer attached to the skin of the ship; a sound-receiver located in a

small tank of water, which tank is mounted on the inner surface of the skin of the ship; and the fathometer indicator, which controls the despatch of the electrical impulses as sound waves, and converts the elapsed time of the resulting echoes into visual indications of depth.

The relation between the sound-producer and the sound-receiver is comparatively simple. The sound is reflected back from the bottom of the ocean and strikes the plates of the ship. That section of the plate supporting the tank which contains the sound-receiver transmits the vibrations through the fresh water in the tank to the sound-receiver which converts the vibrations into electrical waves. Wires running from the sound-receiver carry the electrical waves to the fathometer indicator, where they are shown as visual indications of depth. For soundings within the range required for ordinary navigation purposes, it is only necessary to glance at the dial of the fathometer as the soundings are shown by a flash of light that appears opposite a numeral on the dial. For soundings beyond the range usually required in navigation, a different method is used. The observer listens with head telephones and notes the position of a revolving light when he hears the returning echo in the telephones.

The fathometer is started and stopped by means of a simple switch. Once started, the operation is entirely automatic, depth indications being given continuously. The apparatus contains no parts that require expert adjustment or careful maintenance. This method of taking soundings has many advantages over the older methods. For example, the soundings shown by a fathometer indicate the depth directly beneath a vessel whether the vessel is proceeding or stopped; ordinary speeds have no effect whatever on the operation of the device. On the other hand, the older forms of sounding instruments requiring physical contact with the bottom, consume so much time in their operation that when the sounding is finally reported, the ship, if it has been moving, is far away from the spot, the depth of which is reported. Furthermore, the fathometer can be left in operation for indefinite periods of time resulting in thousands of soundings being indicated per hour. This feature of the device has led navigators to take lines of soundings when approaching objectives and to chart the soundings for comparison with soundings shown on subsequent trips. Thus these navigators become so familiar with the soundings on their true course that they can check position readily by reference to soundings. Fathometers are in operation on practically every important class of vessel.

FATIGUE, in psychology, a condition of mind resulting from prolonged mental activity. It is characterized by an increasing inability to pay attention to things, failing memory, and inability to think. It is also accompanied by peculiar organic sensations. (See EXPERIMENTAL PSYCHOLOGY; INDUSTRIAL PSYCHOLOGY.)

The non-military work carried out by soldiers, such as cleaning the barracks and keeping them in repair, is termed fatigue. For fatigue in muscle, see MUSCLE.

FATIGUE IN INDUSTRY. Before the introduction of power-driven machinery, production depended almost wholly on human effort and skill, but with the so-called Industrial Revolution and the subsequent enormous developments in mechanical and technical methods, the machine was generally accepted as the all-important factor, while the operative *per se* was assumed to play a subordinate and even negligible part. We find, for instance, that the successive reforms in labour conditions made during the 19th century were introduced and advocated solely on humanitarian grounds; that is, it was always tacitly assumed that the worker alone would benefit, and it was frequently asserted (and even admitted by the reformers themselves) that the manufacturers might suffer some disadvantage. The principle that maximum production is contingent on maximum fitness of the worker had not yet been realized. Yet, all the available evidence goes to show that the attainment of the best conditions for the worker is an essential factor in productive capacity.

The study of industrial fatigue, then, which aims at determining those conditions, is of very recent origin. The earliest instance occurred in 1893, when Messrs. Mather and Platt of Manchester, tried their well-known experiment of abolishing the pre-breakfast

spell of work, so reducing the weekly hours of work from 54 to 48. Two years' experience showed that this change had brought about a considerable increase in production and a decrease in the amount of lost time, and on the basis of this experiment the 48-hour week was shortly afterwards introduced into the British Government arsenals and dockyards.

Experiments with similar results were soon afterwards undertaken in other countries, notably Abbé's studies at the Zeiss optical works, Berlin, and those of Fromont at the Engis chemical works in Belgium, whilst, on the more individual side of industrial work, the researches of Taylor on time study and rest pauses, of Gilbreth on movement study, and Munsterberg on the more psychological aspects of industrial life, remain examples of brilliant pioneer work in an untried field.

Meanwhile, in Great Britain interest in these questions continued to grow. In 1913 an investigation on industrial fatigue was undertaken by Stanley Kent on behalf of the Home Office, and in the same year the British Association for the Advancement of Science appointed a research committee for the purpose of investigating fatigue from the economic standpoint. Shortly afterwards, the Health of Munition Workers Committee, formed in 1915, gained valuable knowledge on the effects of hours of work on fatigue and efficiency, accidents and lost time. In 1918, the Industrial Fatigue Research Board was set up by the Medical Research Council to continue the work already started and to study on systematic and scientific lines the laws governing the employment of the human body and mind in industry. Lastly, in 1922 was founded the National Institute of Industrial Psychology, a self-supporting body, which, in addition to research on vocational psychology conducts investigations for individual firms against payment.

Elsewhere good progress has been made, and almost every country—at all events every country with wide industrial interests—possesses one or more institutions or committees dealing with the study of the human factor in industry, chiefly on the side of vocational psychology.

Scope of Term.—Fatigue has been defined as "the sum of the results of activity which show themselves in a diminished capacity for work." This definition, though probably the best devised up to the present, suffers from the fact that it includes within itself other factors, such, for instance, as monotony or boredom, which under present conditions are operative to an equal or even greater extent in industry. In our present state of knowledge, indeed, it appears preferable not to attempt any precise definition of so elusive a phenomenon, but rather to use the term in a wider sense, as including not only the lessened capacity or inclination to do work which results from the previous doing of work of the same kind, but all conditions affecting the body and mind that impede the normal man from working with his maximum fitness or efficiency. In its strict sense, then, the term would include the effects of numerous wide sociological and economic factors, admittedly of great importance, but it is here confined to the narrower field, which has been more explored, namely, the effects of conditions arising in or directly concerned with the work itself. These may be regarded as falling roughly into three categories:—

- (a) Hours of labour, including length of spell, rest pauses, etc.
- (b) Conditions of employment, *i.e.*, the physical conditions of the worker's environment, such as ventilation and lighting.
- (c) Methods of work, constituting the personal factors in efficiency and fatigue, *e.g.*, vocational psychology and movement study. (See article on INDUSTRIAL PSYCHOLOGY.)

Tests of Fatigue.—For the quantitative estimation of industrial fatigue the tests selected must necessarily depend upon circumstances. They fall naturally into two classes, according to whether they consist in the application to the person himself of some test that has been previously standardized (direct tests) or in the measurement of some existing phenomenon indicative of or susceptible to the presence of fatigue (indirect tests).

Notwithstanding many researches, no direct test suitable for practical application has yet been evolved. The McDougall dotting test, which has been frequently used in comparing the results of experimental changes, is more truly an indirect test.

Of indirect tests, variations in output (together with other tests of performance such as the McDougall dotting test) have been far the most generally used and are probably the most trustworthy, provided that adequate allowance can be made for certain disturbing factors such as incentive or technical improvement. Other tests, adopted to meet special circumstances, have been sickness and mortality rates, labour turnover, lost time and accidents.

Examples of Results Obtained.—Any attempt to cover the whole of the work done during recent years would obviously be impossible within the scope of the present article. Accordingly, a few examples have been selected illustrative of results recently obtained in each of the three categories already mentioned.

(a) *Hours of Work.* The false economy of excessive hours of work was clearly demonstrated by Vernon, who found that the long weekly hours introduced during the World War in the supposed interests of increased production, usually resulted in a reduction in hourly output which more than counterbalanced the additional time available, so that the total output was actually less than when the hours were subsequently reduced.

Another subject that has received much study recently is the introduction of short rest-pauses of 5–10 min. in the 4½ or 5-hour spell. With few exceptions, the effect has been a small but genuine increase in output, notwithstanding the shorter time actually worked.

(b) *Conditions of Employment.* The physical environment of the worker has been shown to have a well marked influence on his productive capacity. Vernon and Farmer, for instance, have shown independently that in heavy work, especially when it involves exposure to high temperatures, output usually undergoes a consistent seasonal variation, being greatest in winter and least in summer. This variation can only be ascribed to the relatively disadvantageous effects of the higher atmospheric temperatures in summer. That the reduction in summer can be largely avoided by good ventilation has been shown by Vernon and by Wyatt. This is illustrated by the following table:—

Comparison of Output in Summer and Winter (Tinplate Manufacture)

Factory	State of artificial ventilation	Mean output in		Percentage reduction in summer
		Dec. and Jan.	July and Aug.	
A	Good	100.5	97.5	3.0
B	Moderately good	102.5	97.0	6.4
C	Moderate (or none)	105.5	94.5	10.4
D	None (good natural)	104.5	93.0	11.0
E	None (poor natural)	108.0	93.5	13.4

Evidence also has been adduced by Osborne and Vernon to show that temperature may be a factor in accident causation and that the incidence of minor accidents reaches a minimum at 67.5° F., increasing above and below that temperature.

The effect of illumination on working capacity has been recently explored by Weston in letterpress composing. The results of his experiments in the printing industry show that the increase in output and the diminution of errors (both total and "turned letters") vary as the logarithm of the illumination value, whilst daylight values are only reached at an artificial illumination (25-foot candles) considerably higher than that usually found in practice.

(c) *Methods of Work.* The examples hitherto given have for the most part illustrated the resultant effects of improved conditions on large groups of workers. The possibilities underlying the study of the individual worker were first recognized by F. W. Taylor in the United States and have since led to the development of a special science known as industrial psychology. Since several examples are already given in the article on this (*q.v.*) only two need be quoted here.

Various experiments in the many different methods of weight-carrying have been compared by Bedale on the basis of the energy expended in carrying various loads a given distance. The results suggest that these methods can be arranged roughly in order of

merit, according to the degree of displacement of the body necessary to bring the centre of gravity over the feet. Thus, carrying by means of the yoke and by bundles on the shoulders, were found to be far the most economical, and carrying things on the hip the least. Other factors, however, have an influence; thus, carrying loads on the head, in which the body is maintained upright, was nevertheless found to be ineffective, probably owing to chest-fixation and undue muscular tension.

The final example is derived from an investigation on movement study. In "sweet dipping," a "centre" such as an almond is dipped in a basin of melted sugar with the left hand, covered with the sugar by working it with a fork held in the right hand, and finally placed on a tray. On being photographed, the paths travelled over by the hands of several workers were found by Farmer in most cases to assume roughly the form of straight lines and to involve several reversals of direction. A new improved method of doing the work was then introduced, in which the hand moved in curves, the frequent changes in direction being thus avoided and maximum momentum being used for the most tiring part of this particular work. After a short course of instruction, the output increased by 27% owing to the greater ease with which the work was done.

BIBLIOGRAPHY.—A complete list of references up to the year 1920 will be found in H. G. T. Cannon, *Bibliography of Industrial Efficiency and Management* (1920); the following list is confined to works published since that year:—*Reports of the Industrial Fatigue Research Board* (H.M. Stationery Office); *Journal of the National Institute of Industrial Psychology* (London); "A Comparison of an Eight-Hour Plant and Ten-Hour Plant," *Public Health Service Bulletin No. 106* (Washington); H. FATIGUE OF METALS, a generic term denoting all phenomena associated with the behaviour of metals subjected to repetitions of a range of stress. The term, however, is more generally applied to the progressive deterioration, leading to ultimate fracture, caused by repetitions of a cycle of stress, the maximum stress of the cycle being numerically less than that stress which causes failure on a single application. Fracture by fatigue can be caused by repeated cycles of direct, bending, torsional, or combined stresses, and is accelerated by the presence of shock conditions or surface defects, sudden discontinuities of section, etc., which create local concentrations of stress.

Three Types of Stresses.—Cyclical variations of stress can be divided into three main types: *Alternating stresses* (maximum and minimum stress of cycle differ in sign), *pulsating stresses* (stresses vary from zero to maximum value) and *fluctuating stresses* (vary in magnitude but not in sign). Any stress cycle is defined numerically by the expression $M \pm \frac{1}{2}R$, where M is the average stress, and R is the range of stress (algebraic difference of maximum and minimum stresses). Fatigue range or limiting range (R) is the greatest range of stress which can be applied for an indefinitely great number of repetitions without causing fracture. *Endurance*, under a given range of stress, is the number of repetitions necessary to cause fracture.

In 1849 Jones and Galton investigated the behaviour of cast-iron bars subjected to pulsating bending strains. Fracture occurred in less than 100,000 strainings when the range of strain exceeded one-third of the static ultimate deflection. The endurance decreased at an increasing rate with increased ranges of strain. Bars which had been partially fatigued suffered no loss in static ultimate strength. Somewhat similar tests, on a wrought-iron built-up girder, were made by Fairbairn in 1860–1. The loading was applied with shock. Fairbairn's conclusions confirmed those of the earlier workers and also pointed to the existence of a definite fatigue range for metals. These conclusions received further support from the experiments of Wohler (1871), in which, for the first time, strict attention was paid to the magnitude of the applied stresses. Wohler used iron and steel subjected to

cycles of direct, bending, and torsional stresses.

Subsequent to these early classical investigations, the fatigue of metals has formed the subject of several hundreds of independent researches. The main objects of these investigations and the conclusions drawn from the results are briefly summarised below. (Except where otherwise stated, the remarks apply only to tests conducted at air temperature.)

Evidence of a Limiting Range of Stress.—The results of a series of endurance tests, where any one type of straining action and a constant value of the mean stress of the cycle are employed, show that the endurance (N) to fracture increases at an increasing rate as the range of stress (S) decreases. A curve connecting S and N tends to become parallel to the N axis. It is regarded as established that, in the case of ferrous metals, the S/N curve has become parallel to the N axis at values of N of 10^7 or 2×10^7 reversals, and remains so for the maximum endurances investigated (10^8 to 10^9 cycles). This is also true for some of the pure metals and non-ferrous alloys. Tests on some non-ferrous metals and alloys, however, have shown fractures to occur after several hundred millions of reversals, although, at these endurances, the slope of the S/N curve is very small. In general, *sound metals appear to possess a definite limiting range of stress (R_L)*.

Two relations have been suggested, both of which can be expressed by the formula $R_L = R_{LR} (1 - \frac{M}{f})^x$ where R_L is the limiting range when M is the corresponding value of the mean stress; R_{LR} is the limiting range when $M=0$, f is the static ultimate strength of the metal, and x has the value of 1 or 2. Some experimental results agree with one of these relations, others on a form to neither. For cycles of direct stresses, the linear relation is generally a safe rule between the limits of $M=0$ and the $\frac{1}{2}R$. Some experiments employing torsional stresses have shown that the value of R_L is not altered appreciably by wide variations in the value of M .

Effect of Frequency of Cycle (F) on Limiting Range of R_L .—It is now established that a constant value of R_L is obtained at frequencies up to 5,000 cycles per minute. Tests made on copper, iron, and mild steel at frequencies of 3,000, 30,000, and 60,000 cycles per minute gave progressively greater values of R_L at the higher frequencies.

Under repetitions of the limiting range, or a numerically inferior range, a state is ultimately reached when no further plastic strain occurs; approximate elasticity only results as strain hysteresis can be detected. These *natural* elastic limits are not related to the *primitive*, or original, elastic limits of the material. When the applied range of stress exceeds the limiting range, plastic deformation generally occurs until the cracking stage is reached.

Effect on Limiting Range of Temperature of Test.—Available data relate only to reversed stresses ($M=0$). The limiting range (R_L) is largely unaffected in value until temperatures of about 400°C . are reached. At higher temperatures R_L decreases, the rate of decrease varying with different metals. The effect of elevated temperatures on R_L is not, in general, as marked as on the static ultimate strength under prolonged loading; e.g., the values of $\frac{1}{2}R_L$ for four steels and one non-ferrous alloy, at various temperatures between 550°C . and 750°C ., have been found to be *equal to, or greater than*, the static strength (under prolonged loading) at the same temperatures.

Effect of Repeated Stresses on Microstructure of Metals.—Repeated stresses applied to *crystalline aggregates* cause slip bands to appear on the surfaces of favourably orientated crystals. If R_L is not exceeded, this local action ceases after a certain number of repetitions and the metal becomes strain-hardened. Under repetitions of greater stress ranges, microscopic cracks are initiated in the regions of maximum slip, and fracture is caused by propagation of these cracks throughout the metal. Even in ductile materials, the process of initiation and propagation of these cracks may be so highly localised that the appearance of fracture is one usually associated with that of brittle materials. Precisely similar surface phenomena are exhibited by single metallic crystals subjected to repeated stresses, suggesting that fatigue failure is essentially a process of deterioration of crystal-

line material and that the chief effect of the inter-crystal boundaries in aggregates is to inhibit slip due to the change in orientation of neighbouring crystals.

A fundamental theory of fatigue has yet to be advanced. The attrition theory (Ewing and Humfrey) is not supported by the results of recent research. A number of theories have been based on the assumption (Beilby) that plastic strain in metals causes a change from the crystalline to the amorphous state on the surfaces of slip. The manner in which the fatigue crack is initiated has not been explained satisfactorily. The results of experiments on single crystals (Gough, Hanson, and Wright) suggest that the effect of slip is to produce local distortions within the crystal, thus setting up internal stresses which, under repetitions of stress ranges, lead to the disruption of inter-atomic bonds and the initiation of cracks. The breaking-up, under strain, of a crystal grain into a number of crystallites of slightly varying orientations is an alternative hypothesis which is consistent with observed facts. Little doubt exists that, in some manner, fatigue failure is the direct result of local plastic deformation, and it seems highly improbable that fatigue would occur in a material which is truly elastic.

The importance of an understanding of fatigue phenomena in its relation to industry cannot be over-estimated. Those machine and structural components whose working conditions can be so adjusted as to exclude the possibility of fatigue failure constitute a very small minority. The whole trend of development of modern engineering lies in the direction of the employment of higher working stresses, speeds, and temperatures. These considerations, together with the necessities of eliminating unnecessary material—to reduce first cost—and the reduction of the weight power factor—which has become of prime importance since the advent of aircraft—tend to make the static strength properties of metals (except at elevated temperatures) of less relative importance than their fatigue properties. A conservative estimate of failures in modern engineering practice attributes 80% of such failures to fatigue. As fatigue failures are usually unaccompanied by any marked preliminary warnings, a deplorable loss of life has often resulted. See METALLOGRAPHY; METALLURGY; MATERIALS, STRENGTH OF.

FATIMITES, also called **FATIMIDES**, the name of a dynasty called after Fatima, daughter of the prophet Mohammed, from whom and her husband the Caliph Ali, son of Abu Talib, they claimed descent. The dynasty is also called 'Obaidi (Ubaidi) after 'Obaidallah, the first sovereign, and 'Alawi, a title which it shares with other dynasties claiming the same ancestry. Three sovereigns, who reigned in north-western Africa before the annexation of Egypt, are worthy of mention: al-Mahdi 'Obaidallah 297 (909); al-Qā'im Mohammed 322 (934); al-Mansūr Ismā'il 334 (945).

The dynasty owed its rise to the attachment to the family of the prophet which was widespread in the Muslim world, and the belief that the sovereignty was the right of one of its members. Owing, however, to the absence of the principle of primogeniture there was difference of opinion as to the person whose claim should be enforced, and a number of sects arose maintaining the rights of different branches of the family. The Fatimites were supported by those who regarded the sovereignty as vested in Ismā'il, son of Ja'far al-Sādiq, great-great-grandson of Ali, through his second son Hosain (Husain). Of this Ismā'il the first Fatimite caliph was supposed to be the great-grandson. The line of ancestors between him and Ismā'il is, however, variously given, even his father's name being quite uncertain, and in some of the pedigrees even Ismā'il does not figure.

Apparently when the family first became of political importance their Alid descent was not disputed at Baghdad, and the poet al-Sharif al-Radi (d. A.H. 406: A.D. 1015), in whose family the office of Naqib (registrar of the Alids) was hereditary, appears to have acknowledged it (*Diwān*, ed. Beirut, p. 972). When their

success became a menace to the caliphs of Baghdad, genealogists were employed to demonstrate the falsity of the claim, and a considerable literature, both official and unofficial, rose in consequence. The founder of the dynasty was made out to be a scion of a family of heretics from whom the terrible Carmathian sect had originated: later on (perhaps owing to the rôle played by Jacob, son of Killis, in bringing the Fatimites to Egypt), the founder was made out to have been a Jew, either as having been adopted by the heretic supposed to be his father, or as having been made to personate the real 'Obaidallah, who had been killed in captivity.

The Difficulty of the Problem.—The uncertainty of the genealogies offered by their partisans renders any positive solution of the problem impossible. What seems to be clear is that secretly within the Abbasid empire propaganda was carried on in favour of one or other Alid aspirant, and the danger which any such aspirant incurred by coming forward openly led to his whereabouts being concealed except from a very few adherents. What is known then is that towards the end of the 3rd Islamic century the leader of the sect of Ismā'ilites (Assassins, *q.v.*) who afterwards mounted a throne, lived at Salamia, near Emesa (Homs), having agents spread over Arabia, Persia and Syria, and frequently receiving visits from pious adherents, who had been on pilgrimage to the grave of Hosain (Ḥusain). Such visitors received directions and orders such as are usual in secret societies. One of these agents, Abū Abdallah al-Hosain called al-Shī'ī, said to have filled the office of censor (*muhtasib*) at Basra, received orders to carry on a mission in Arabia, and at Mecca is said to have made the acquaintance of some members of the Berber tribe Kutama, south of the bay of Bougie. These persons persuaded him to travel home with them in the character of teacher of the Koran, but according to some authorities the ground had already been prepared there for a political mission. He arrived in the Kutama country in June 893, and appears very soon to have been made chief, thereby exciting the suspicion of the Aghlabite ruler of Kairawān, Ibrāhīm b. Aḥmad, which, however, was soon allayed. His success provoked a civil war among the Berbers, but he was protected by a chief named Ḥasan b. Hārūn, and displaced sufficient military ability to win respect. Nine years after his arrival he made use of the unrest following on the death of the Aghlabite Ibrāhīm to attack the town of Mila, which he took by treachery, and turned into his capital; the son and successor of Ibrāhīm, Abu'l-Abbās 'Abdallah, sent his son al-Aḥwal to deal with the new power, and he defeated al-Shī'ī in some battles, but in 903 al-Aḥwal was recalled by his brother Ziyādatallah, who had usurped the throne, and put to death.

At some time after his first successes al-Shī'ī sent a messenger (apparently his brother) to the head of his sect at Salamia, bidding him come to the Kutama country, and place himself at the head of affairs, since al-Shī'ī's followers had been taught to pay homage to a Mahdī who would at some time be shown them. It is said that 'Obaidallah, who now held this post, was known to the court at Baghdad, and that on the news of his departure orders were sent to the governor of Egypt to arrest him: but by skilful simulation 'Obaidallah succeeded in escaping this danger and with his escort reached Tripoli safely. Instructions had by this time reached the Aghlabite Ziyādatallah to be on the watch for the Mahdī, who was finally arrested at Sijilmāsa (Tafilalt) in the year A.H. 292 (A.D. 905); his companion, al-Shī'ī's brother, had been arrested at an earlier point, and the Mahdī's journey to the south-west must have been to elude pursuit.

THE EARLY FATIMITES

The invitation to the Mahdī was premature, for Ziyādatallah had sent a powerful army to oppose al-Shī'ī, which, making Constantine its headquarters, had driven al-Shī'ī into the mountains: after six months al-Shī'ī secured an opportunity for attacking it, and won a complete victory. Early in 906 another army was sent to deal with al-Shī'ī, and an earnest appeal came from the caliph Muqtafi (Moktafi), addressed to all the Muslims of Africa, to aid Ziyādatallah against the usurper.

The operations of the Aghlabite prince were unproductive of any decided result, and by September 906 al-Shī'ī had got possession of the important fortress Tubna and some others. Further forces were immediately sent to the front by Ziyādatallah, but these were defeated by al-Shī'ī and his officers, to whom other towns capitulated, till Ziyādatallah found it prudent to retire from Al-Urbus or Laribus, which had been his headquarters, and entrench himself in Raqqāda, one of the two capitals of his kingdom, Kairawān being the other.

By March 909 Raqqāda had become untenable, and Ziyādatallah resolved to flee from his kingdom; he made for Egypt, and thence to Trak: his final fate is uncertain. The cities Raqqāda and Kairawān were immediately occupied by al-Shī'ī, who proceeded to send governors to the other places of importance in what had been the Aghlabite kingdom, and to strike new coins, which, however, bore no sovereign's name. Orders were given that the Shī'ite peculiarities should be introduced into public worship.

Al-Shī'ī's Victories.—In May 909 al-Shī'ī led a tremendous army westwards to the kingdom of Tahert, where he put an end to the Rustamite dynasty, and appointed a governor of his own: he thence proceeded to Sijilmāsa where 'Obaidallah lay imprisoned, with the intention of releasing him and placing him on the throne. After a brief attempt at resistance, the governor fled, and al-Shī'ī entered the city, released 'Obaidallah and presented him to the army as the long-promised Imām. The day is given as Aug. 26, 909. 'Obaidallah had been in prison more than three years. Whether his identity with the Mahdī for whom al-Shī'ī had been fighting was known to the governor of Sijilmāsa is uncertain. If it was, the governor and his master the Aghlabite sovereign might have been expected to make use of their knowledge and outwit al-Shī'ī by putting his Mahdī to death. Opponents of the Fatimites assert that this was actually done, and that the Mahdī presented to the army was not the real 'Obaidallah, but (as usual) a Jewish captive, who had been suborned to play the rôle.

The chief command was now assumed by 'Obaidallah, who took the title "al-Mahdī, Commander of the Faithful," thereby claiming the headship of the whole Muslim world: Raqqāda was at the first made the seat of the court, and the Shī'ite doctrines were enforced on the inhabitants, not without encountering some opposition. Revolts which arose in different parts of the Aghlabite kingdom were, however, speedily quelled.

The course followed by 'Obaidallah in governing independently of al-Shī'ī soon led to dissatisfaction on the part of the latter, who, urged on it is said by his brother, decided to dethrone their Mahdī, and on the occasion of an expedition to Ténés, which al-Shī'ī commanded, organized a conspiracy with that end. The conspiracy was betrayed to 'Obaidallah, who took steps to defeat it, and on the last day of July 911 contrived to assassinate both al-Shī'ī and his brother. Thus the procedure which had characterized the accession of the 'Abbāsīd dynasty was repeated. It has been conjectured that these assassinations lost the Fatimites the support of the organization that continued to exist in the East, whence the Carmathians figure as an independent and even hostile community, though they appear to have been amenable to the influence of the African caliph.

The New Revelation.—'Obaidallah had now to face the dissatisfaction of the tribes whose allegiance al-Shī'ī had won, especially the Kutāma, Zenāta and Lawāta: the uprising of the first assumed formidable proportions, and they even elected a Mahdī of their own, one Kādū b. Mu'arik al-Māwatī, who promulgated a new revelation for their guidance. They were finally defeated by 'Obaidallah's son Abu'l-Qāsim Mohammed, who took Constantine, and succeeded in capturing the new Mahdī, whom he brought to Raqqāda. 'Obaidallah ousted other opponents by ruthless executions. By the middle of the year 913 by his own and his son's efforts he had brought his kingdom into order. After the style of most founders of dynasties he then selected a site for a new capital, to be called after his title Mahdia (*q.v.*), on a peninsula called Ḥamma (Cape Africa) south-south-east of Kairawān. Eight years were spent in fortifying this place, which in 921 was made the capital of the empire.

After defeating internal enemies 'Obaidallah turned his attention to the remaining 'Abbāsid possessions in Africa, and his general Habāsah b. Yūsuf in the year 913 advanced along the northern coast, taking various places, including the important town of Barca. He then advanced towards Egypt, and towards the end of July 914, being reinforced by Abu'l-Qāsim, afterwards al-Qā'im, entered Alexandria. The danger led to measures of unusual energy being taken by the Bagdad caliph Moqtadir, an army being sent to Egypt under Mu'nīs, and a special post being organized between that country and Bagdad to convey messages uninterruptedly. The Fatimite forces were defeated, partly owing to the insubordination of the general Habāsah, in the winter of 914, and returned to Barca and Kairawān with great loss.

FURTHER EXPEDITIONS

A second expedition was undertaken against Egypt in the year 919, and on July 10 Alexandria was entered by Abu'l-Qāsim, who then advanced southward, seizing the Fayum and Ushmūnain (Eshmunain). He was presently reinforced by a fleet, which, however, was defeated at Rosetta in March of the year 920 by a fleet despatched from Tarsus by the 'Abbāsid caliph Moqtadir, most of the vessels being burned. Through the energetic measures of the caliph, who sent repeated reinforcements to Fostat, Abu'l-Qāsim was compelled in the spring of 921 to evacuate the places which he had seized, and return to the west with the remains of his army, which had suffered much from plague as well as defeat on the field. On his return he found that the court had migrated from Raqqāda to the new capital Mahdia (*q.v.*). Meanwhile other expeditions had been despatched by 'Obaidallah towards the west, and Nekor (Nakur) and Fez had been forced to acknowledge his sovereignty. The remaining years of 'Obaidallah's reign were largely spent in dealing with uprisings in various parts of his dominions, the success of which at times reduced the territory in which he was recognized to a small area.

'Obaidallah's Death.—'Obaidallah died on March 4, 933, and was succeeded by Abu'l-Qāsim, who took the title al-Qā'im bi-amr Allah. He immediately after his accession occupied himself with the reconquest of Fez and Nekor, which had revolted during the last years of the former caliph. He also despatched a fleet under Ya'qūb b. Ishāq, which ravaged the coast of France, took Genoa, and plundered the coast of Calabria before returning to Africa. A third attempt made by him to take Egypt resulted in a disastrous defeat at Dhāt al-Humān, after which the remains of the expedition retreated in disorder to Barca.

The later years of the reign of Qā'im were troubled by the uprising of Abū Yazīd Makhlad al-Zenātī, a leader who during the former reign had acquired a following among the tribes inhabiting the Jebel Aures, including adherents of the 'Ibādī sect. After having fled for a time to Mecca, this person returned in 937 to Tauzar (Touzer), the original seat of his operations, and was imprisoned by Qā'im's orders. His sons, aided by the powerful tribe Zenāta, succeeded in forcing the prison, and releasing their father, who continued to organize a conspiracy on a vast scale, and by the end of 943 was strong enough to take the field against the Fatimite sovereign, whom he drove out of Kairawān. Abū Yazīd proclaimed himself a champion of Sunnī doctrine against the Shi'īs, and ordered the legal system of Mālik to be restored in place of that introduced by the Fatimites. Apparently the doctrines of the latter had as yet won little popularity, and Abū Yazīd won an enormous following, except among the Kutāma, who remained faithful to Qā'im.

The Rout of Qā'im.—On the last day of Oct. 944, an engagement was fought between Kairawān and Mahdia at a place called al-Akhawān, which resulted in the rout of Qā'im's forces, and the caliph's being shortly after shut up in his capital, the suburbs of which he defended by a trench. Abū Yazīd's forces were ill-suited to maintain a protracted siege, and since, owing to the former caliph's forethought, the capital was in a condition to hold out for a long time, many of them deserted and the besiegers gained no permanent advantage. After the siege had lasted some ten months Abū Yazīd was compelled to raise it (Sept. 945); the struggle, however, did not end with that event, and

for a time the caliph and Abū Yazīd continued to fight with varying fortune, while anarchy prevailed over most of the caliph's dominions. On Jan. 13, 946, Abū Yazīd shut up Qā'im's forces in Susa which he began to besiege, and attempted to take by storm.

DECLINE OF THE FATIMITES

On May 18, 945, while Abū Yazīd was besieging Susa, the caliph al-Qā'im died at Mahdia, and was succeeded by his son Ismā'il, who took the title Manšūr. He almost immediately relieved Susa by sending a fleet, which joining with the garrison inflicted a severe defeat on Abū Yazīd, who had to evacuate Kairawān also; but though the cities were mainly in the hands of Fatimite prefects, Abū Yazīd was able to maintain the field for more than two years longer, while his followers were steadily decreasing in numbers, and he was repeatedly driven into fastnesses of the Sahara. In Aug. 947 his last stronghold was taken, and he died of wounds received in defending it. His sons carried on some desultory warfare against Manšūr after their father's death. A town called Manšūra or Šābrā was built adjoining Kairawān to celebrate the decisive victory over Abū Yazīd, which, however, did not long preserve its name. The exhausted condition of north-west Africa due to the protracted civil war required some years of peace for recuperation, and further exploits are not recorded for Manšūr, who died on March 19, 952.

Widening Authority.—His son, Abū Tamīm Ma'add, was 22 years of age at the time, and succeeded his father with the title Mo'izz liddin Allah. His authority was acknowledged over the greater part of the region now constituting Morocco, Algeria and Tunisia, as well as Sicily, and he appears to have had serious thoughts of endeavouring to annex Spain. At an early period in his reign he made Jauhar, who had been secretary under the former caliph, commander of the forces, and the services rendered by this person to the dynasty made him count as its second founder after al-Shī'ī. In the years 958 and 959 he was sent westwards to reduce Fez and other places where the authority of the Fatimite caliph had been repudiated, and after a successful expedition advanced as far as the Atlantic. As early as 966 the plan of attempting a fresh invasion of Egypt was conceived, and preparations made for its execution; but it was delayed, it is said at the request of the caliph's mother, who wished to make a pilgrimage to Mecca first; and her honourable treatment by Kāfūr when she passed through Egypt induced the caliph to postpone the invasion till that sovereign's death.

In Aug. 972 Mo'izz resolved to follow Jauhar's pressing invitation to enter his new capital Cairo. With his arrival there the centre of the Fatimite power was transferred from Mahdia and Kairawān to Egypt, and their original dominion became a province called al-Maghrib, which immediately fell into the hands of a hereditary dynasty, the Zeirids, acknowledging Fatimite suzerainty. The first sovereign was Bulukkīn, also called Abu'l-Futūh Yūsuf, appointed by Mo'izz as his viceroy on the occasion of his departure for Egypt: separate prefects were appointed for Sicily and Tripoli; and at the first the minister of finance was to be an official independent of the governor of the Maghrib. On the death of Bulukkīn in 984 he was succeeded by a son who took the royal title al-Manšūr, under whose rule an attempt was made by the Kutāma, instigated by the Caliph, to shake off the yoke of the Zeirids, who originated from the Sanhaja tribe. This attempt was defeated by the energy of Manšūr in 988; and the sovereignty of the Fatimites in the Maghrib became more and more confined to recognition in public prayer and on coins, and the payment of tribute and the giving of presents to the viziers of Cairo. The fourth ruler of the Zeirid dynasty, called Mo'izz, endeavoured to substitute 'Abbāsid suzerainty for Fatimite: his land was invaded by Arab colonies sent by the Fatimite caliph, with whom in 1051 Mo'izz fought a decisive engagement, after which the dominion of the Zeirids was restricted to the territory adjoining Mahdia; a number of smaller kingdoms rising up around them. The Zeirids were finally overthrown by Roger II. of Sicily in 1148.

The Last Fatimite Caliph.—After the death of al-Adid, the last Fatimite caliph in Egypt, some attempts were made to place on the throne a member of the family, and at one time there

seemed a chance of the Assassins, who formed a branch of the Fatimite sect, assisting in this project. In 1174 a conspiracy for the restoration of the dynasty was organized by 'Umarah of Yemen, a court poet, with the aid of eight officials of the government: it was discovered and those who were implicated were executed. Two persons claiming Fatimite descent took the royal titles al-Mo'taşim billah and al-Hâmid lillah in the years 1175 and 1176, respectively; and as late as 1192 we hear of pretenders in Egypt. Some members of the family are traceable till near the end of the 7th century of Islam.

The doctrines of the Fatimites as a sect, apart from their claim to the sovereignty in Islam, are little known, and we are not justified in identifying them with those of the Assassins, the Carmathians or the Druses, though all these sects are connected with them in origin. A famous account is given by Maqrîzî of a system of education by which the neophyte had doubts gently instilled into his mind till he was prepared to have the allegorical meaning of the Koran set before him, and to substitute some form of natural for revealed religion. In most accounts of the early days of the community it is stated that the permission of wine-drinking and licentiousness, and the community of wives and property formed part of its tenets. There is little in the recorded practice of the Fatimite state to confirm or justify these assertions; and they appear to have differed from orthodox Muslims rather in small details of ritual and law than in deep matters of doctrine.

FATS IN COOKERY. Besides being a highly concentrated form of heat-supplying food (hydro-carbons) fats have many specialized uses in cookery: as a frying medium, for shortening pastry, or other flour mixtures, greasing receptacles in which food is cooked and basting roast or baked meats. Cooking fats, obtained from "fixed oils and fats" may be either of animal or vegetable origin. The following are the chief culinary fats:—

Animal.—Cream is easily digested; it can replace cod liver oil, and is used for making delicate dishes (creams, ice creams, soufflés, cream soups, etc.). Clotted cream is also used as a garnish. With the addition of sugar, cream will keep in a cool place for about 36 hours. Butter, if pure and kept cool, is one of the best fats for making pastry, cakes, etc., and for blending with flour in sauce-making, and also for nutrition, as it contains vitamins. For frying vegetables and delicate fish or meats, butter is preferable to any other fat on account of its delicate flavour. Fresh butter is better than salt for pastry-making. Margarine is made from animal fat (often mixed with vegetable oils) churned in milk. Dripping and clarified fat is obtained by roasting meat. Chicken fat is the most delicate, and is good for cake making. Lard (*q.v.*) is a very rich fat, excellent for light frying if used with other fats, but inclined to make food a little greasy if used alone. It is best to use one-third lard to two-thirds other fat for pastry and frying purposes. Lard should not be used for "pan" frying. Pure lard is frequently mixed with other cheaper fats and sold as compound lard. Suet is much used in making boiled puddings where the fat can be chopped up with other ingredients; also for adding to certain dishes to make up fat deficiency. Both beef and mutton suet are used, but beef suet is generally preferred to mutton on account of its nutty flavour. Kidney suet should be used where possible.

Vegetable.—(1) Olive oil is the best frying medium and superior to animal fat, as it keeps the colour of the food fried a light golden-brown; it must, however, be carefully used as the flavour is spoilt if the oil is raised to too high a temperature. Olive oil is also much employed for making salad dressings and for greasing dishes for delicate foods such as creams, etc. As an ingredient in batter mixtures for frying fish, olive oil is particularly useful in producing a light batter. It is much adulterated with cheaper oils such as cotton-seed, peanut, etc. (2) Margarine from nut fats is now much employed for general cooking purposes and as a substi-

tute for butter. Owing to the fact that it contains milk and salt, margarine is not suitable for frying where boiling fat is needed. (3) Cacao fat (butter) is a vegetable fat that is solid at ordinary temperatures. Though excellent as a cooking fat it has the great drawback of possessing a decidedly pungent flavour rather like chocolate, which makes it undesirable for general use. (4) Vegetable and nut oils, refined and tasteless, are much used in the United States for "pan" frying, frying, salad dressings and flour mixtures. Those most generally used are cotton-seed, corn and peanut oils. Some are solidified (hydrolyzed).

Larding.—This is a method of introducing fat into lean or dry meat and consists of either placing slices of fat (usually pork or bacon fat) over meat which is to be roasted or threading strips of fat through the flesh with a larding needle.

Basting.—When meat, fish or game is baked or roasted, the flesh is kept moist by basting the surface over with some kind of fat. Oil may be used for fish, but as a general rule dripping is better for meat. Butter is frequently used for game because of its more delicate flavour. (See also OILS AND FATS.)

(J. A. ST.)

FATTY ACIDS, a highly important class of compounds of carbon, hydrogen and oxygen, in which one group, the carboxyl(ic) group, CO·OH, has a hydrogen atom replaceable by metals and basic radicals. One class of fatty acids can be regarded as derived from the hydrocarbons (see HYDROCARBON) of the paraffin series, through the substitution of a hydrogen atom by the acidic carboxyl group. Thus, counting hydrogen as the first hydrocarbon, we get the two series:

Hydrocarbon	Fatty or Aliphatic Acid
Hydrogen, H-H	Formic Acid, H-COOH
Methane, CH ₃ -H	Acetic Acid, CH ₃ -COOH
Ethane, C ₂ H ₅ -H	Propionic Acid, C ₂ H ₅ -COOH
Propane, C ₃ H ₇ -H	Butyric Acid, C ₃ H ₇ -COOH
Butane, C ₄ H ₉ -H	etc.

The earlier acids in the series are treated in separate articles (*q.v.*; see also CHEMISTRY: *Organic: Aliphatic Compounds*). Other fatty acids are similarly related to the ethylene and acetylene groups of "unsaturated" hydrocarbons; further complications are introduced in hydroxy-acids, where one or more hydroxyl (—OH) groups may replace hydrogen atoms besides those replaced by the carboxyl group. Here will be discussed only those higher members of the series which play an important part in the chemistry of the naturally occurring glycerides (*q.v.*; see also OILS AND FATS).

Some of these fatty acids may contain as few as four carbon atoms in the molecule, others as many as 24; the most common natural fatty acids contain 12, 16 or 18 carbon atoms in each molecule. There are two main types of these fatty acids, "saturated" and "unsaturated," and it is essential to know something of the difference between them.

In saturated fatty acids each carbon atom is united with as much hydrogen as it can hold and palmitic acid, C₁₆H₃₂O₂, the most widespread saturated acid, is formulated, for instance, as CH₃·(CH₂)₁₄·COOH. The most common members of this group are lauric (C₁₁H₂₂·COOH), myristic (C₁₃H₂₆·COOH), palmitic (C₁₅H₃₀·COOH), and stearic (C₁₇H₃₄·COOH) acids; from C₉H₁₈·COOH (capric acid) upwards they (and the corresponding glycerides) are solids at the ordinary temperature and the melting-point increases with increasing number of carbon atoms, stearic acid, for example, melting at 71° C. The melting-point of a fat is determined by the particular acids present in greatest quantity.

In unsaturated acids there is a deficiency of hydrogen in each molecule, so that one or more pairs of carbon atoms, instead of being completely saturated with hydrogen (—CH₂—CH₂—), have some of their chemical combining power left unsatisfied (—CH:CH—). In consequence, such bodies, especially if several of these unsaturated centres are present in the molecule, can become attached to other elements, for example, atmospheric oxygen, and this is the basis of the utility of linseed and other oils in paints; fixation of oxygen at the unsaturated centres causes the oil to become a solid tenacious film. Obviously this capacity for combining with oxygen, useful in the case of var-

nishes, may be a detriment in other cases, where it causes the development of rancidity in edible fats or even soaps. Of the acids with one unsaturated centre, oleic acid is by far the most common and is present in practically all known fats; other similar acids are palmitoleic, $C_{15}H_{29}COOH$, and erucic, $C_{21}H_{41}COOH$; whilst linoleic acid, $C_{17}H_{31}COOH$, and linolenic acid, $C_{17}H_{29}COOH$, contain respectively two and three unsaturated centres.

The position, in the molecule of a fatty acid, of the pair of carbon atoms which form an unsaturated centre, is known in several cases, for example in:

Oleic acid	$CH_3 \cdot (CH_2)_7 \cdot CH : CH \cdot (CH_2)_7 \cdot COOH$
Linoleic acid	$CH_3 \cdot (CH_2)_4 \cdot CH : CH \cdot CH_2 \cdot CH : CH \cdot (CH_2)_7 \cdot COOH$
Palmitoleic acid	$CH_3 \cdot (CH_2)_5 \cdot CH : CH \cdot (CH_2)_7 \cdot COOH$
Erucic acid	$CH_3 \cdot (CH_2)_7 \cdot CH : CH \cdot (CH_2)_{11} \cdot COOH$

Obviously it is important to be able to assess the average magnitude of the fatty acids present in naturally occurring glycerides, and also their state of "unsaturation." The former value is arrived at by measurement of the amount of caustic alkali necessary to combine exactly with the fatty acid present, and is known as the *saponification number*; it is inversely proportional to the molecular weight of the fat. The unsaturation is measured by the power of the fat under examination to combine with iodine under specified conditions, the percentage of iodine absorbed being known as the *iodine value* of the fat.

Finally, it may be mentioned that compounds of the fatty acids with alcohols other than glycerol are widely distributed in nature, the alcohols in question being usually similar in chemical structure to palmitic and stearic acids (for example, cetyl alcohol $C_{16}H_{33}OH$, or ceryl alcohol, $C_{26}H_{53}OH$). Such compounds are classified as *waxes*, and include beeswax, spermaceti, carnauba and other waxes; these substances are useful in polishes and were formerly used in candles, but the waxes as a class have much less utility than the fats. (See GLYCERINE; OILS AND FATS; WAX, etc.)

FAUBOURG, the French name for a portion of a town which lies outside the walls, hence properly a suburb. The name survives in certain parts of Paris, such as the Faubourg St. Antoine and the Faubourg St. Germain, etc., which have long since ceased to be suburbs. The earlier spelling *faux-bourg*, and the occurrence in mediaeval Latin of *falsus-burgus* (see Ducange, *Glossarium*, s.v. "Falsus-Burgus"), was taken as showing its obvious origin and meaning, the sham or quasi-borough.

FAUCES, in anatomy, the hinder part of the mouth, which leads into the pharynx. In architecture a term given by Vitruvius to narrow passages on either side of the tablinum, through which access could be obtained from the atrium to the peristylar court in the rear, and therefore the term often applied to narrow connecting passages in Roman houses.

FAUCHER, LÉONARD JOSEPH [LÉON] (1803-1854), French politician and economist, was born at Limoges on Sept. 8, 1803. With the revolution of 1830 he was drawn into active political journalism on the Liberal side. He was on the staff of the *Temps* from 1830 to 1833, when he became editor of the *Constitutionnel* for a short time. He was editor from 1839 until 1842 of the *Courrier Français*. Faucher belonged in policy to the dynastic Left, and consistently preached moderation to the more ardent Liberals. He advocated a customs union between France and Belgium. In 1843 he visited England to study the English social system, publishing the results of his investigations in a series of *Études sur l'Angleterre* (2 vols., 1845), published originally in the *Revue des deux mondes*. He helped to organize the Bordeaux association for free-trade propaganda, and was elected in 1847 to the chamber of deputies for Reims as a free-trader. After the revolution of 1848 he represented the department of Marne in the Constituent Assembly, where he opposed the limitation of the hours of labour, the creation of the national relief works in Paris and the abolition of the death penalty. Under the presidency of Louis Napoleon he became minister of public works, and then minister of the interior, but was compelled to resign office on May 14, 1849. In 1851 he was again

minister of the interior until Napoleon declared his intention of resorting to universal suffrage. He died at Marseilles on Dec. 14, 1854.

His miscellaneous writings were collected (2 vols., 1856) as *Mélanges d'économie politique et de finance*, and his speeches in the legislature were printed in vol. ii. of *Léon Faucher, biographie et correspondance* (2 vols., 1875).

FAUCHET, CLAUDE (1744-1793), French revolutionary bishop, was born at Dornes (Nièvre) on the 22nd of September 1744. He was a curate of the church of St. Roch, Paris, when he was engaged as tutor to the children of the marquis of Choiseul. He was successively grand vicar to the archbishop of Bourges, preacher to the king, and abbot of Montfort-Lacarre. The "philosophic" tone of his sermons caused his dismissal from court in 1788 before he became a popular speaker in the Parisian sections. He was one of the leaders of the attack on the Bastille, and on Aug. 5, 1789 he delivered an eloquent funeral sermon for the citizens slain on July 14. In September he was elected to the Commune, from which he retired in October 1790. The last occasion on which he carried his public with him was in a sermon preached at Notre Dame on Feb. 14, 1791. In May he became constitutional bishop of Calvados, and was deputy to the Legislative Assembly, and afterwards to the Convention. At the king's trial he voted for the appeal to the people and for the penalty of imprisonment. He protested against the execution of Louis XVI. in the *Journal des amis* (January 26, 1793), and next month was denounced to the Convention for prohibiting married priests from the exercise of the priesthood in his diocese. He remained secretary to the Convention until the accusation of the Girondists in May 1793. In July he was imprisoned on the charge of supporting the federalist movement at Caen, and of complicity with Charlotte Corday, whom he had taken to see a sitting of the Convention on her arrival in Paris. Of the second of these charges he was certainly innocent. With the Girondist deputies he was brought before the revolutionary tribunal on Oct. 30, and was guillotined on the following day.

See *Mémoires . . . ou Lettres de Claude Fauchet* (5th ed., 1793); *Notes sur Claude Fauchet* (Caen, 1842).

FAUCIT, HELENA SAVILLE (1817-1898), English actress, the daughter of John Saville Faucit, an actor, was born in London. Her first London appearance was made on Jan. 5, 1836, at Covent Garden as Julia in *The Hunchback*. Her success in this was so definitely confirmed by her subsequent acting of Juliet, Lady Teazle, Beatrice, Imogen and Hermione, that within 18 months she was engaged by Macready as leading lady at Covent Garden. In 1851 she was married to Mr. (afterwards Sir) Theodore Martin, but still acted occasionally for charity. She died at her home near Llangollen in Wales on Oct. 31, 1898.

See Sir Theodore Martin's *Helena Faucit* (1900).

FAUJAS DE SAINT-FOND, BARTHÉLEMY (1741-1819), French geologist and traveller, was born at Montélimart on May 17, 1741. He studied law at Grenoble, and was admitted advocate to the parliament. He rose to be president of the seneschal's court (1765). There he began to study the forms, structure, composition and superposition of rocks in the Alps. In 1775 he discovered in the Velay a rich deposit of pozzuolana, which in due course was worked by the government. He was appointed by Louis XVI. assistant naturalist to the museum, to which office was added some years later (1785, 1788) that of royal commissioner for mines. In 1793 he became professor at the Jardin des Plantes, Paris. In *Recherches sur les volcans éteints du Vivarais et du Velay* (1778) he developed his theory of the origin of volcanoes. Faujas recognized the volcanic nature of the basaltic columns of the cave of Fingal (Staffa). Among his separate works are—*Voyage en Angleterre . . .* (1797); *Histoire naturelle de la province de Dauphiné* (1781-1782); *Minéralogie des volcans* (1784); and *Essai de géologie* (1803-1809). Faujas died on July 18, 1819.

FAULT, a failing, mistake or defect. (Mid. Eng. *faute*, through the French, from the popular Latin use of *fallere*, to fail; the original *l* of the Latin being replaced in English in the 15th century).

In geology, a fault is a dislocation in rocks, the result of crustal movements. Faults differ from joints in not being simply cracks, but fissures when differential movement of the two sides has taken place. The three principal types are known as *normal faults*, *reversed faults* or *overthrusts* and *transcurrent faults*. The surface of dislocation is called the *fault-plane*: not a plane in the mathematical sense, since the surface is always found to be irregular and

FIG. 1.—THE EFFECT OF FAULTING ON OUTCROP

curved on being traced for any distance. The general inclination of this plane to the horizontal is the *dip* of the fault; to the vertical the *hade*; where the fault is vertical there is no dip or hade. The amount of vertical displacement is the *throw*: of the lateral displacement, the *heave*. In a gently inclined fault the heave will be great for even a small throw. The *downthrow* or *downcast* side of a fault is that side where the strata have moved relatively downwards: the other side is the *upthrow* or *upcast*. Faults, especially minor dislocations, run in any direction, but they are frequently found to coincide with the directions of dip and strike of stratified rocks and so to have a causal connection with systems of folding. Thus *dip faults* and *strike faults* arise. The effect of such faults on the outcrops of stratified rocks is shown in the diagrams.

Normal faults are those in which the fault plane is vertical, or inclined in such a manner that the downthrow is on the dip side of the fault plane. Reversed faults are those where the upthrow is on the dip side, so that one faulted block has been thrust upon

FIG. 2.—(A) DIP FAULT SHIFTING OUTCROP DOWN THE DIP. (B) STRIKE FAULT WITH DOWNTROW DOWN THE DIP CUTTING OUT BEDS. (C) STRIKE FAULT WITH DOWNTROW UP THE DIP WITH REPEATING BEDS. THE BLOCKS SHOWN IN BROKEN OUTLINE HAVE BEEN REMOVED BY DENUDATION

the other. Transcurrent faults occur in regions of great folding, often extending for miles along the dip of the strata: there is no vertical, only horizontal movement.

Normal Faults.—When two blocks of rock masses have moved relatively to one another, the fault plane is likely to have an irregular surface and its outcrop, or trace of the plane on the surface of the earth, will show minor departures from a straight line quite apart from the wider deviations due to topography. In

¹The term "normal" is an old but convenient one for a certain class of fault. It is not necessarily the most widely distributed type.

places undisturbed rock may be found on either side, but generally there is a crushed and pulverized zone, with slickensiding, for inches or even several feet. Where this zone is composed of shattered rock debris it is known as *fault breccia*. Many metaliferous and mineral veins are dislocations filled with crystallized material. In an important fault, several types of rocks may occur on either side at different localities and the nature of the dislocation will differ from place to place. Thus with hard rocks on either

FIG. 3.—(A) DIP FAULT, SHIFTING ESCARPMENT. (B) OBLIQUE FAULT, ESCARPMENT EN ECHELON. (C) STRIKE FAULT, REPEATING ESCARPMENT

side there may be hardly any selvage; passing through shales the fault may become a zone of contortion and slickensiding of considerable width. In throw, faults vary from the merest slip to a movement of thousands of feet: in distance across country, from a few hundred feet to hundreds of miles. Often faults are found to pass into monoclinical folds, but as often they die out by gradually diminishing throw. Downwards, faulting must evidently disappear when the zone of rock flowage is reached at some eight miles. When stratified rocks are traversed by a fault, the beds are often found to be bent on either side, as would be expected in rocks which could adjust themselves to slow movement by folding. Thus in a normal fault the beds bend downwards on the upthrow and upwards on the downthrow: the opposite is the case in a reversed fault. Normally denudation planes down the surface equally on either side of a fault, but a resistant rock, abutting against much more easily denuded beds, may give rise to an unstanding ridge or face, a *fault scarp*.

Groups of Faults.—Small faults generally occur singly, but the more extensive dislocations are more often composed of a number of parallel dislocations running into each other to give the effect of a fault zone. A number of parallel faults with downthrows in one direction give rise to *step-faulting*. Fault planes with the same strike but hading towards one another give rise to *trough faults* when one faults another: when hading away from one another, to *ridge faults*. Strike and dip faults of the same age rarely, if ever, cross one another, though they coalesce. When one fault crosses another and shifts it in the same way as a stratum is shifted in outcrop by a fault, the two faults belong to different periods, the shifted fault being obviously the older.

FIG. 4.—GROUP OF FAULTS

and shattered material in this plane is termed *crush-breccia* or *crush-conglomerate*.

Origin of Faults.—Faults are connected with horizontal movements and folding of the earth's crust. During the formation of mountains of elevation the crust is bulged upwards and the rocks are subjected to great compression. Relief is effected partly by folding and partly by overthrusting: if shear takes place before overfolding reversed faulting obtains. Transcurrent faults signify the differential movements forward of parts of thrusts. Normal faults form at the conclusion of the great movement when the mass begins to settle down. Direct subsidence in uncrushed regions

also gives rise to normal faulting. In the great majority of cases faults have been as slow in their making as folds, for great river systems have been undisturbed by faults of thousands of feet throw, as in the course of the Colorado River. Fault scarps are nearly always due to the juxtaposition of rocks of widely differing resistance to weathering. Occasional cases occur, however, where ancient faults have increased their throw by sudden jumps at intervals, giving rise to earthquakes.

FAUNA, the feminine partner (in later times explained as sister or wife) of Faunus (*q.v.*), and apparently identical originally with the Bona Dea. The term is used collectively for all the animals in any given geographical area or geological period, or for an enumeration of the same. It thus corresponds to the term "flora" in respect to plant life.

FAUNUS, an old Italian rural deity (the "kindly," from Lat. *favere*), the bestower of fruitfulness on fields and cattle. As such he is akin to or identical with Inuus ("fructifier") and Lupercus (see **LUPERCALIA**). He was also called Fatuus, and with him was associated Fatua. He is represented as having prophetic powers, and is not unlike the fairies, pucks, etc., of British mythology. Under Greek influence he was identified with Pan. Rationalizing mythologists made him into an early king of Latium, the son of Picus and father of Latinus, the teacher of agriculture and cattle-breeding, and the introducer of the religious system of the country, honoured after death as a tutelary divinity. Two festivals called Faunalia were celebrated in honour of Faunus, one on Feb. 13 in his temple on the island in the Tiber, the other in the country on Dec. 5 (Ovid, *Fasti*, ii. 193; Horace, *Odes*, iii. 18, 10).

FAURE, FRANÇOIS FÉLIX (1841-1899), president of the French Republic, was born in Paris on Jan. 30, 1841, the son of a small furniture maker. He made a fortune as a tanner and merchant at Havre, and was elected to the National Assembly on Aug. 21, 1881. He sat on the Left, interesting himself chiefly in matters concerning economics, railways and the navy. He was under-secretary for the colonies (1882-85 and 1888), and in 1893 was made vice-president of the chamber. In 1894 he obtained cabinet rank as minister of marine under Dupuy. In the January following he was unexpectedly elected president of the Republic upon the resignation of Casimir-Périer. His fine presence and his tact on ceremonial occasions rendered the state some service when in 1896 he received the tsar of Russia at Paris, and in 1897 returned his visit, after which meeting the momentous Franco-Russian alliance was publicly announced. The latter days of Faure's presidency were embittered by the Dreyfus affair, which he was determined to regard as *chose jugée*. But at a critical moment in the proceedings he died (Feb. 16, 1899).

See E. Maillard, *Le Président F. Faure* (1897); P. Bluysen, *Félix Faure intime* (1898); and F. Martin-Ginouvier, *F. Faure devant l'histoire* (1895).

FAURÉ, GABRIEL (1845-1924), French musical composer, was born at Pamiers (Ariège) on May 13, 1845. He studied at the school of sacred music directed by Niedermeyer, first under Dietsch, and subsequently under Saint-Saëns. He became "maître de chapelle" at the church of the Madeleine in 1877, and organist in 1896. Fauré was made professor of composition at the Conservatoire (1896), and director (1905). He retired in 1920 and died on Nov. 4, 1924. His work at the Conservatoire, extending over nearly a quarter of a century, had great importance in the history of French music. Roger-Ducasse, Ravel and Florent Schmitt were among his pupils. He himself wrote music in all forms, but his fame rests mainly on his exquisite songs and on a considerable body of original and interesting chamber music. Recognition came to him slowly, probably because of the quality of unexpectedness in his compositions. Among the more familiar of his chamber music works are two sonatas for violin and piano-

FIG. 5.—FAULT SCARP. ANCIENT METAMORPHOSED ROCKS FAULTED AGAINST SOFT TERTIARY BEDS. AMOTAPE MOUNTAINS, PERU

forte, two sonatas for violoncello, a posthumous string quartet and two quintets for pianoforte and strings. For a bibliography of his works see Octave Séré, *Musiciens français, d'aujourd'hui* (5th ed. 1910).

FAURIEL, CLAUDE CHARLES (1772-1844), French historian, philologist and critic, was born at St. Étienne. Though the son of a poor joiner, he received a good education in the Oratorian colleges of Tournon and Lyons. He was twice in the army and from 1799 to 1801 he was private secretary to Fouché (*q.v.*). Some articles which Fauriel published in the *Décade philosophique* (1800) on a work of Madame de Staël's—*De la littérature considérée dans ses rapports avec les institutions sociales*—led to an intimate friendship with her. About 1802 he contracted with Madame de Condorcet a liaison which lasted till her death (1822).

At the revolution of July, 1830, he became professor of foreign literature at the Sorbonne. The *Histoire de la Gaule méridionale sous la domination des conquérants germains* (4 vols., 1836) was the only completed section of a general history of southern Gaul which he had projected. In 1836 he was elected a member of the Academy of Inscriptions, and in 1837 he published a translation of a Provençal poem on the Albigensian war. He died on July 15, 1844. After his death his friend Mary Clarke (afterwards Madame J. Möhl) published his *Histoire de la littérature provençale* (3 vols., 1846)—his lectures for 1831-32. Fauriel was biased in this work by his preconceived and somewhat fanciful theory that Provence was the cradle of the *chansons de geste* and even of the Round Table romances; but he gave a great stimulus to the scientific study of Old French and Provençal. *Dante et les origines de la langue et de la littérature italiennes* (2 vols.) was published in 1854.

Fauriel's *Mémoires*, found with Condorcet's papers, are in the Institute library. They were written at latest in 1804, and include some interesting fragments on the close of the consulate, Moreau, etc. Though anonymous, Lalanne, who published them (*Les Derniers Jours du Consulat*, 1886), proved them to be in the same handwriting as a letter of Fauriel's in 1803. The same library has Fauriel's correspondence, catalogued by Ad. Rénier (1900). For Fauriel's correspondence with Guizot see *Nouvelle Rev.* (Dec. 1, 1901, by V. Glachant), and for his love-letters to Miss Clarke (1822-44) the *Revue des deux mondes* (1908-09, by E. Rod). See further Sainte-Beuve, *Portraits contemporains*, ii.; A. Guillois, *Le Salon de Mme. Helvétius* (1894) and *La Marquise de Condorcet* (1897); O'Meara, *Un Salon à Paris: Mme. Möhl* (undated); and J. B. Galley, *Claude Fauriel* (1909).

FAUST or FAUSTUS, the name of a magician and charlatan of the 16th century, famous in legend and in literature. The historical Faust forms little more than the nucleus round which a great mass of legendary and imaginative material gradually accumulated. That such a person existed, there is, however, sufficient proof, though the opinion long maintained by some that he was identical with Johann Fust the printer is now universally rejected. He is first mentioned in a letter, dated Aug. 20, 1507, of the learned Benedictine Johann Trithemius or Trithemius (1462-1516) abbot of Spanheim, to the mathematician and astrologer, Johann Windung. Trithemius, himself reputed a magician, speaks contemptuously of Faust, who called himself "Magister Georgius Sabellicus Faustus Junior, as a fool rather than a philosopher, a vain babbler and mountebank who ought to be whipped. The same unflattering estimate is contained in the second extant notice of Faust, in a letter of the jurist and canon Konrad Mudt (Mutianus Rufus) of Oct. 3, 1513, to Heinrich Urbanus. Mudt, too, simply regards Faust as a charlatan. So does another contemporary, Philipp Begardi, who in his *Index sanitatis* (Worms, 1539) ranks Faust, with Theophrastus Paracelsus, among the "wicked, cheating, useless and unlearned doctors."

It was Johann Gast (d. 1572) a Protestant pastor of Basel who in his *Sermones convivales* (Basel, 1543) first credited the magician with genuine supernatural gifts. Gast believed Faust to be in league with the devil, by whom about 1525 he was ultimately carried off, and declared the performing horse and dog by which he was accompanied to be familiar and evil spirits. Further information was given to the world by Johann Mannel or Manlius (d. 1560), councillor and historian to the emperor Maximilian II.,

in his *Locorum communium collectanea* (Basel, undated). Manlius reports a conversation of Melanchthon in which the Reformer speaks of Faust as "a disgraceful beast and sewer of many devils" as having been born at Kundling (Kundlingen or Knittlingen), a little town near his own native town (of Bretten), and as having studied magic at Cracow. According to Melanchthon Faust was killed by the devil wringing his neck. While he lived he had taken about with him a dog, which was really a devil. A similar opinion seems to have been held of Faust by Luther, who in Widmann's Faust-book is mentioned as having declared that, by God's help, he had been able to ward off the evils which Faust with his sorceries had sought to put upon him. Bullinger also, in his *Theatrum de beneficiis* (Frankfurt 1569) mentions Faust as one of those "of whom the Scriptures speak in various places, calling them *magi*." Lastly Johann Weiher, Wierus or Piscinarius (1515-88) a pupil of Cornelius Agrippa, body physician to the duke of Cleves and a man of enlightenment, who opposed the persecution of witches—in his *De praestigiis daemonum* (Basel 1563, etc.) speaks of Faust as a drunken vagabond who had studied magic at Cracow, and before 1540 had practised "this beautiful art shamelessly up and down Germany, with unspeakable deceit, many lies and great effect."

Such was the man as he appeared to his contemporaries: a wandering charlatan who lived by his wits, or a necromancer whose supernatural gifts were the outcome of a foul pact with the enemy of mankind. Whatever his character, his efforts to secure notoriety certainly succeeded. By the latter part of the 16th century he had become the necromancer *par excellence*, and all that legend had to tell about the great wizards of the middle ages, Virgil, Pope Sylvester, Roger Bacon, Michael Scot, or the mythic Klingsor, had become for ever associated with his name. When in 1587, the oldest Faust-book was published, the Faust legend was, in all essential particulars, already complete. The origin of the main elements of the legend must be sought far back. The idea of a compact with the devil for the purpose of obtaining superhuman power or knowledge, is of Jewish origin, dating from the centuries immediately before and after the Christian era which produced the Talmud, the Kabbalah and such magical books as that of Enoch. In the mystical rites that accompanied the incantations with which the Jewish magicians evoked the Satanism we have the prototypes and originals of all the ceremonies which occupy the books of magic down to the various versions of the *Höllenzwang* ascribed to Faust. The other principle underlying the Faust legend, the belief in the essentially evil character of purely human learning, has existed ever since the triumph of Christianity set divine revelation above human science. The legend of Theophilus (a Cilician archdeacon of the 6th century, who sold his soul to Satan for no better reason than to clear himself of a false charge brought against him by his bishop) was immensely popular throughout the middle ages, and in the 8th century formed the theme of a poem by the nun Hroswitha of Gandersheim. Equally widespread were the legends which gathered round the great name of Gerbert (Pope Sylvester II.). Gerbert's vast erudition, far in advance of his age, cast upon him the suspicion of traffic with the infernal powers; and in due course the tale arose of a compact with the arch-fiend, by which the scholar had obtained the summit of earthly ambition at the cost of his immortal soul. These are but the two most notable of many similar stories, and in an age which believed in witchcraft and the ubiquitous activity of devils, it was natural that they should be retold in all good faith of a notorious wizard who was himself at no pains to deny their truth. The Faust legend, however, owes its peculiar significance to the special conditions of the age which gave it birth; the age of the Renaissance and the Reformation. The opinion that the religious reformers were the champions of liberty of thought against the obscurantism of Rome is mistaken. To themselves they were the protagonists of "the pure Word of God" against the corruptions of the Church, and the sceptical spirit of Italian humanism was as abhorrent to them as to the Catholic reactionaries. If, then, in Goethe's drama, Faust ultimately develops into the type of the unsatisfied yearning of the human intellect for "more than earthly meat and drink" this was

because the great German humanist infused into the old story a spirit absolutely opposed to that by which it had originally been inspired. The Faust of the early Faust-books, of the ballads, the dramas and the puppet-plays which grew out of them, is damned because he prefers human to "divine" knowledge; "he laid the Holy Scriptures behind the door and under the bench, refused to be called doctor of theology, but preferred to be styled doctor of medicine." The orthodox moral of the earliest versions is preserved to the last in the puppet-plays. The voice to the right cries: "Faust! Faust! desist from this proposal! Go on with the study of theology, and you will be the happiest of mortals." The voice to the left answers "Faust! Faust! leave the study of theology. Betake you to necromancy, and you will be the happiest of mortals!" The Faust legend was, in fact, the creation of orthodox Protestantism, its moral the inevitable doom which follows the wilful revolt of the intellect against divine authority as represented by the Holy Scriptures and its accredited interpreters.

It was doubtless this orthodox and Protestant character of the Faust story which contributed to its immense popularity in the Protestant countries. The first edition of the *Historia von D. Johann Fausten* published by Johann Spies at Frankfurt in 1587, sold out at once, and before the year was out it had been reprinted in four pirated editions. In the following year a rhymed version was printed at Tübingen, a second edition was published by Spies at Frankfurt, and a version in Low German by J. J. Balhorn at Lübeck. Reprints and amended versions continued to appear in Germany every year, till they culminated in the pedantic compilation of Georg Rudolf Widmann, who obscured the dramatic interest of the story by his well-meant efforts to elaborate the orthodox moral. Widmann's version of 1599, formed the basis of that of Johann Nicholas Pfitzer, published at Nuremberg in 1674, which passed through six editions, the last appearing in 1726. Lastly there appeared about 1712, what was to prove the most popular of all the Faust-books: *The League with the Devil established by the world-famous Arch-necromancer and Wizard Dr. Johann Faust*, by a Christian Believer (*Christlich Meynenden*). This version which bore the obviously false date of 1525, passed through many editions, and was circulated at all the fairs in Germany. Abroad the success of the story was scarcely less striking. A Danish version appeared in 1588. In England the *History of the Damnable Life and Deserved Death of Dr. John Faustus* was published some time between 1588 and 1594. In France the translation of Victor Palma Cayet was published at Paris in 1592, and in the course of the next 200 years went through 15 editions; the oldest Dutch and Flemish versions are dated 1592; and in 1612 a Czech translation was published at Prague. Besides the popular histories of Faust, numerous ballads on the same subject were also soon in circulation. Of these, the most interesting for the English reader is *A Ballad of the Life and death of Dr. Faustus the great congerer*, published in 1588 with the imprimatur of the learned Aylmer, bishop of London. This ballad is supposed to have preceded the English version of Spies's Faust-book, on which Marlowe's drama was founded.

To Christopher Marlowe belongs the honour of first seeing the great dramatic possibilities of the Faust legend. *The Tragical History of D. Faustus as it hath bene acted by the Right Honourable the Earle of Nottingham his servants* was first published by Thomas Bushall in 1604. As Marlowe died in 1593, the play must have been written shortly after the appearance of the English version of the Faust story on which it was based. The first recorded performance was on Sept. 30, 1594. As Marlowe's *Faustus* is the first, so it is incomparably the finest of the Faust dramas which preceded Goethe's masterpiece, though, like most of Marlowe's work, it is very unequal. In Marlowe, too, Protestant orthodoxy is conciliated by irrelevant insults to the Roman Church and by the final catastrophe, when Faustus pays for his revolt against the Word of God by the forfeit of his soul. This conception, which followed that of the popular Faust histories underlay all further developments of the Faust drama for nearly 200 years. Of the serious stage plays founded on this theme, Marlowe's *Faustus* remains the sole authentic example until near the end of the 18th century; but in Germany the *Comedy of Dr. Faust*, in

one form or another continued to be a popular item in the repertoires of theatrical companies until far into the 18th century. It is supposed that the German versions were based on those introduced into the country by English strolling players early in the 17th century. However this may be, the dramatic versions of the Faust legend followed much the same course as the prose histories. Just as these gradually degenerated into chap-books hawked at fairs, so the dramas were replaced by puppet-plays, handed down by tradition through generations of showmen. In this way the traditional Faust story retained its popularity until far into the 19th century, long after, in the sphere of literature, Goethe had for ever raised it to quite another plane.

It was natural that during the literary revival in Germany in the 18th century, when German writers were eagerly on the look-out for subjects to form the material of a truly national literature, the Faust legend should have attracted their attention. Lessing was the first to point out its great possibilities, and he himself wrote a Faust drama, of which only a fragment remains. To Lessing, not to Goethe, is due the new point of view from which the story was approached by most of those who, after about the year 1770, attempted to tell it. The traditional Faust legend represented the sternly orthodox attitude of the Protestant reformers. Even the mitigating elements which the middle ages had permitted had been banished by the stern logic of the theologians of the new religion. Theophilus had been saved in the end by the intervention of the Blessed Virgin; Faust was irrevocably damned, since the attractions of theology proved insufficient to counteract the fascinations of the classic Helen. But if he was to become, in the 18th century, the type of the human intellect faced by the problems of human life, it was intolerable that his struggles should issue in eternal reprobation. *Es irrt der Mensch so lang er strebt*, which sums up in one pregnant line the spirit of Goethe's *Faust*, sums up also the spirit of the age which killed with ridicule the last efforts of persecuting piety. Lessing, in short, proclaimed that the final end of Faust must be not his damnation, but his salvation. This is the measure of Goethe's debt to Lessing. The essential change which Goethe himself introduced into the story is in the nature of the pact between Faust and Mephistopheles, and in the character of Mephistopheles himself. The Mephistopheles of Marlowe, as of the old Faust-books, for all his brave buffoonery, is a melancholy devil, with a soul above the unsavoury hell in which he is forced to pass a hopeless existence. Goethe's Mephistopheles is no such fallen angel. He is according to his own definition, the Spirit of Denial, the impersonation of that utter scepticism which can see no distinction between high and low, between good and bad, and is therefore without aspiration because it knows no "divine discontent." And the compact which Faust makes with this spirit is from the first doomed to be void. Faustus had bartered away his soul for a definite period of pleasure and power. The conception that underlies the compact of Faust with Mephistopheles is far more subtle. He had sought happiness vainly in the higher intellectual and spiritual pursuits; he is content to seek it on a lower plane since Mephistopheles gives him the chance; but he is confident that nothing that "such a poor devil" can offer him could give him that moment of supreme satisfaction for which he craves. He goes through the traditional mummery of signing the bond with scornful submission; for he knows that his damnation will not be the outcome of any formal compact, but will follow inevitably, and only then, when his soul has grown to be satisfied with what Mephistopheles can purvey him. It is because Mephistopheles fails to give him this self-satisfaction that the compact comes to nothing. When, at last, Faust cries to the passing moment to remain, it is because he has forgotten self in enthusiasm for a great and beneficent work, in a state of mind the very antithesis of all that Mephistopheles represents. In the old Faust-books, Faust had been given plenty of opportunity for repentance, but the inducements had been no higher than the exhibition of a throne in heaven on the one hand and the tortures of hell on the other. Goethe's *Faust* departs widely from this orthodox standpoint. Faust shows no signs of "repentance"; he simply emerges by the innate force of his character from a lower into a higher

state. The triumph, foretold by "the Lord" in the opening scene, was inevitable from the first, since though—

Man errs so long as he is striving,
A good man through the obscurest aspiration
Is ever conscious of the one true way.

This idea, which inspired also the kindred theme of Browning's *Paracelsus*, is the main development introduced by Goethe into the Faust legend. The episode of Gretchen does not belong to the legend at all; and it is difficult to deny the pertinency of Charles Lamb's criticism, "What has Margaret to do with Faust?" Yet in spite of all that may be said of the irrelevancies with which Goethe overloaded especially the second part of the poem, his *Faust* remains for the modern world the final form of the legend out of which it grew, the magnificent expression of the broad humanism which has replaced the spirit inspiring the early Faust-books.

See Karl Engel, *Zusammenstellung der Faust-Schriften vom 16. Jahrhundert bis Mitte 1884*—a 2nd ed. of the *Bibliotheca Faustiana* (1874) (Oldenburg, 1885), a complete bibl. of all pub. matter concerned, even somewhat remotely with Faust. Carl Kiesewetter, *Faust in der Geschichte und Tradition* (Leipzig, 1893). (W. A. P.)

FAUSTINA, ANNIA GALERIA, the younger, daughter of Antoninus Pius, and wife of Marcus Aurelius Antoninus. She is accused by Dio Cassius and Capitolinus of gross profligacy, and was reputed to have instigated the revolt of Avidius Cassius against her husband, but this may be untrue, as he was always devoted to her. She died in A.D. 175 or 176 (so Clinton, *Fasti rom.*) at Halala, near Mount Taurus, in Cappadocia, whither she had accompanied Aurelius. Charitable schools for orphan girls (hence called *Faustinianae*) were founded in her honour.

See Capitolinus, *Marcus Aurelius*; Dio Cassius lxxi. 22, lxxiv. 3; E. Renan, in *Mélanges d'histoire et des voyages*, 169-195.

FAUSTUS OF RIEZ (c. 408-c. 492), bishop of Riez in Provence, was born probably in Britain, and at an early age entered the monastery of Lérins, where he became abbot in 433. He was appointed bishop of Riez about 460, but his opposition to Arianism led Euric, king of the Visigoths, to banish him in 477. About this time he wrote his chief work, the *Libri duo de Gratia Dei et humanae mentis libero arbitrio*, against Predestinarianism, a work marred by Semipelagianism and finally condemned by the Synod of Orange in 529. Faustus seems to have returned from exile on the death of Euric in 485.

His works are to be found in the series, *Corpus Scrip. eccles. lat.*, vol. xxi., and in Migne's *Patrol Lat.*, vol. xlviii. See Herzog, *Realenzyklopädie*.

FAUVISM: see PAINTING.

FAVARA, a town of Sicily, province of Girgenti, 8 m. E. of the city of that name by rail. Pop. (1921), 21,379. An agricultural centre, with sulphur and other mines, and a fine castle (1280) of the Chiamonte family.

FAVART, CHARLES SIMON (1710-1792), French dramatist, was born in Paris, the son of a pastry-cook. He was educated at the college of Louis-le-Grand, and after his father's death carried on the business for a time. After the production of his first vaudeville, *Les Deux Jumelles* (1734), he devoted himself entirely to the drama. Among his most successful works were *Annette et Lubin*, *Le Coq du village* (1743), *Ninette à la cour* (1753), *Les Trois Sultanes* (1761) and *L'Anglais à Bordeaux* (1763). Favart became director of the Opéra Comique, and in 1745 married Marie Justine Benoîte Duronceray (1727-72), a beautiful young dancer, singer and actress, who as "Mlle. Chantilly" had made a successful début the year before. By their united talents and labours the Opéra Comique rose to such a height of success that it aroused the jealousy of the rival Comédie Italienne and was suppressed. Favart then undertook the direction of a troupe of comedians which was to accompany the army of Maurice de Saxe into Flanders. The enemy became desirous of hearing Favart's company, and permission was given to gratify them, battles and comedies thus curiously alternating with each other. But the marshal, who was an admirer of Mme. Favart, began to persecute her with his attentions. To escape him she went to Paris. A *lettre de cachet* was issued against the husband, who fled to Strasbourg and hid in a cellar. Mme. Favart mean-

while had been established by the marshal in a house at Vaugirard; but as she proved a fickle mistress she was suddenly arrested and confined in a convent, where she was brought to unconditional surrender in the beginning of 1750. Before the year was out the marshal died, and Mme. Favart reappeared at the Comédie Italienne, where for 20 years she was the favourite actress. To her is largely due the beginnings of the change in this theatre to performances of a lyric type adapted from Italian models, which developed later into the genuine French comic opera. She was also a bold reformer in matters of stage costume, playing the peasant with bare arms, in wooden shoes and linen dress, and not, as heretofore, in court costume with enormous hoops, diamonds and long white kid gloves. With her husband, and other authors, she collaborated in a number of successful pieces, and one—*La Fille mal gardée*—she produced alone.

Favart survived his wife 20 years. He died in Paris on May 12, 1792. His plays have been several times republished in various editions and selections (1763–72, 12 vols.; 1810, 3 vols.; 1813; 1853). His correspondence (1759–63) with Count Durazzo, director of theatres at Vienna, was published in 1808 as *Mémoires et correspondance littéraire, dramatique et anecdotique de C. S. Favart*. It furnishes valuable information on the state of the literary and theatrical worlds in the 18th century.

FAVERSHAM, a market town and river-port, member of the Cinque Port of Dover, and municipal borough in the Faversham parliamentary division of Kent, England, on a creek of the Swale, 9 m. W.N.W. of Canterbury on the Southern railway. Pop. (1931) 10,091. The church of St. Mary of Charity (restored 1874) is of Early English architecture, and has some remains on one of the columns of frescoes of the same period, while the 14th-century paintings in the chancel are in better preservation. Some of the brasses are very fine, and there is one commemorating King Stephen, as well as a tomb said to be his and to have been transferred from the abbey which he founded (1147), of which only a wall and the foundations below ground remain. At Davington, close to Faversham, there are remains, incorporated in a residence, of the cloisters and other parts of a Benedictine priory founded in 1153. Faversham has a free grammar school founded in 1527 and removed to its present site in 1877. Faversham creek is navigable up to the town for vessels of 200 tons. The shipping trade by London hoys is considerable, chiefly in coal, timber and agricultural produce, and the port maintains a customs officer. The oyster fisheries are important, and are managed by a very ancient gild, the Company of Free Dredgermen of the Hundred and Manor of Faversham. Hops and cherries are largely grown in the neighbourhood; brewing, brickmaking and the manufacture of cement are carried on, and there are large powder mills in the vicinity. The town is governed by a mayor, four aldermen and 12 councillors, has its own Quarter Sessions and a separate commission of the peace; and owns its own electricity undertaking and recreation grounds (20 ac.).

There was a Romano-British village on the site of Faversham. The town (Fauresfeld, Faveresham) owed its early importance to its situation as a port on the Swale, to the fertile country surrounding it, and to the neighbourhood of Watling Street. In 811 it was called the king's town "of Fafresham," and a witenagemot was held here under Aethelstan. In 1086 it was assessed as royal demesne, and a market was held here at this date. Stephen and Matilda were buried in the abbey which they had endowed with the manor and hundred of Faversham; this grant caused many disputes between the abbot and men of Faversham concerning the abbot's jurisdiction. Faversham was probably a member of Dover from the earliest association of the Cinque Ports, certainly as early as Henry III., as shown by a charter of 1252 granting among other liberties of the Cinque Ports, that the "barons" or freemen of Faversham should plead only in Shepway Court. In this reign also the abbot appointed the mayor, but from the reign of Edward I. he was elected by the freemen and then installed by the abbot. The corporation was prescriptive, and a hallmote held in 1293 was attended by a mayor and twelve jurors. All the liberties of the Cinque Ports were granted to the barons of

Faversham by Edward I. in 1302, and confirmed by Edward III. in 1365, and by later monarchs. The governing charter till 1835 was that of Henry VIII., granted in 1545 and confirmed by Edward VI.

FAVORINUS (2nd century A.D.), Greek sophist and philosopher, was born at Arles, but at an early age began his lifelong travels through Greece, Italy and the East. His extensive knowledge and great oratorical powers, raised him to eminence both in Athens and in Rome. With Plutarch, who dedicated to him his treatise *Περὶ τοῦ πρώτου ψυχροῦ*, with Herodes Atticus, to whom he bequeathed his library at Rome, with Demetrius the Cynic, Cornelius Fronto, Aulus Gellius, and with Hadrian himself, he lived on intimate terms. It was Favorinus who, on being silenced by Hadrian in an argument, remarked that it was foolish to criticize the logic of the master of thirty legions. Of his numerous works, we possess only a few fragments (unless the *Κορινθιακὸς λόγος* attributed to his tutor Dio Chrysostom is by him), preserved by Aulus Gellius, Diogenes Laërtius, Philostratus, and Suidas, the second of whom borrows from his *Παντοδαπὴ ἱστορία* (miscellaneous history) and his *Ἀπομνημονεύματα* (memoirs). As a philosopher, Favorinus belonged to the Sceptics, his chief work being *Πυρρώνειοι τρόποι* (the Pyrrhonian Tropes) in which he endeavours to show that the methods of Pyrrho were useful to those who intended to practise in the law courts.

See Philostratus, *Vitae sophistarum*, i. 8; Suidas, s.v.; frags. in C. W. Müller, *Frag. Hist. Graec.* iii. 4; L. Legré, *Favorin d'Arles* (Marseille, 1900); T. Colardeau, *De Favorini Studiis et Scriptis* (1903).

FAVRAS, THOMAS DE MAHY, MARQUIS DE (1744–1790), French royalist, was born on March 26, 1744, at Blois. In 1772 he became first lieutenant of the Swiss guards of the count of Provence (afterwards Louis XVIII.). He retired in 1775, and married in 1776 Victoria Hedwig Caroline, princess of Anhalt-Bernburg-Schaumburg, whose mother, deserted by her husband Prince Carl Ludwig in 1749, had found refuge with her daughter in the house of Marshal Soubise. After his marriage he went to Vienna to press the restitution of his wife's rights, and spent some time in Warsaw. In 1787 he was authorized to raise a patriotic legion to help the Dutch against the stadtholder William IV. and his Prussian allies. Returning to Paris at the outbreak of the Revolution, he became implicated in schemes for the escape of Louis XVI. He was commissioned by the count of Provence, through the comte de la Châtre, to negotiate a loan of two million francs from the bankers Schaumel and Sartorius. Favras was betrayed; and, with his wife, he was arrested on Christmas Eve 1789. In the course of a trial of nearly two months' duration the witnesses disagreed, and even the editor of the *Révolutions de Paris* (No. 30) admitted that the evidence was insufficient, but an armed attempt of the Royalists on the Châtelet on Jan. 26, which was defeated by La Fayette, sealed his fate. He was hanged on the Place de Grève on Feb. 19, 1790. Favras was generally regarded as a martyr to his refusal to implicate the count of Provence, and Madame de Favras was pensioned by Louis XVI.

The official *dossier* of Favras's trial for high treason against the nation disappeared from the Châtelet, but its substance is preserved in the papers of a clerk.

BIBLIOGRAPHY.—For particulars see A. Tuetey, *Répertoire général des sources manuscrites de l'histoire de Paris pendant la Révolution Française* (vol. i., 1890, pp. 175–177); M. Tournoux, *Bibl. de l'histoire de Paris pendant la Révolution Française* (vol. i. pp. 196–198, 1890). See also a memoir by Eduard, Freiherr v. Stillfried Ratènc (Vienna, 1881), and an article by Alexis de Valon in the *Revue des deux mondes* (June 15, 1851).

FAVRE, JEAN ALPHONSE (1815–1890), Swiss geologist, born at Geneva on March 31, 1815, was for many years professor of geology in the academy at Geneva, and afterwards president of the Federal Commission with charge of the geological map of Switzerland. In 1867 he published *Recherches géologiques dans les parties de la Savoie, du Piémont et de la Suisse voisines du Mont Blanc*. He died at Geneva in June 1890.

FAVRE, JULES CLAUDE GABRIEL (1809–1880), French statesman, was born at Lyons on March 21, 1809, and

was an advocate by profession. From the time of the revolution of 1830 he declared himself a republican. After the revolution of 1848 he was deputy for Lyons to the constituent assembly. On the 2nd of December 1851 he tried with Victor Hugo and others to organize an armed resistance to Louis Napoleon in the streets of Paris. After the *coup d'état* he withdrew from politics, resumed his profession, and distinguished himself by his defence of Felice Orsini, the perpetrator of the attack against the life of Napoleon III. In 1858 he was elected deputy for Paris, and was one of the "five" who gave the signal for the republican opposition to the empire. In 1863 he became the head of his party, and delivered a number of addresses denouncing the Mexican expedition and the occupation of Rome. These addresses, eloquent, clear and incisive, won him a seat in the French Academy in 1867. With Thiers he opposed the declaration of war against Prussia in 1870, and at the news of the defeat of Napoleon III. at Sedan he demanded from the legislative assembly the deposition of the emperor. In the government of national defence he became vice-president under General Trochu, and minister of foreign affairs, with the onerous task of negotiating peace with victorious Germany. He proved to be less adroit as a diplomat than he had been as an orator, and committed several irreparable blunders. His statement on Sept. 6, 1870, that he "would not yield to Germany an inch of territory nor a single stone of the fortresses" was a piece of oratory which Bismarck met on the 19th by his declaration to Favre that the cession of Alsace and of Lorraine was the indispensable condition of peace. He arranged for the armistice of June 28, 1871, without knowing the situation of the armies, and without consulting the government at Bordeaux. He neglected to inform Gambetta that the army of the East (80,000 men) was not included in the armistice, and it was thus obliged to retreat to neutral territory. Favre withdrew from the ministry, discredited, on Aug. 2, 1871, but remained in the chamber of deputies. Elected senator on Jan. 30, 1876, he continued to support the government of the republic against the reactionary opposition, until his death on Jan. 20, 1880.

His works include many speeches and addresses, notably *La Liberté de la Presse* (1849), *Défense de F. Orsini* (1866), *Discours de réception à l'Académie française* (1868), *Discours sur la liberté intérieure* (1869). In *Le Gouvernement de la Défense Nationale*, 3 vols., 1871-1875, he explained his rôle in 1870-1871. After his death his family published his speeches in 8 volumes.

See G. Hanotaux, *Histoire de la France contemporaine* (1903, etc.); also E. Benoît Lévy, *Jules Favre* (1884).

FAVUS, a disease of the scalp, but occurring occasionally on any part of the skin, and even at times on mucous membranes. The uncomplicated appearance is that of a number of yellowish, circular, cup-shaped crusts grouped in patches like a piece of honeycomb, each about the size of a split pea, with a hair projecting in the centre. These increase in size and become crusted over, so that the characteristic lesion can only be seen round the edge of the scab. Growth continues to take place for several months, when the scab comes away, leaving a shining bare patch destitute of hair. The disease is essentially chronic, lasting from 10 to 20 years. It is caused by the growth of a fungus (*Achorion Schönleini*) and was the first disease in which a fungus was discovered—by J. L. Schönlein in 1839. Since then other varieties of the fungus have been described. Favus is commonest among the poorer Jews of Russia, Poland, Hungary, Galicia and the East, and among the same class of Mohammedans in Turkey, Asia Minor, Syria, Persia, Egypt, Algiers, etc. It is not rare in the southern departments of France, in some parts of Italy, and in Scotland. It is spread by contagion, usually from cats, often, however, from mice, fowls, or dogs. Before treatment can be begun the scabs must be removed by means of carbolized oil, and the head thoroughly cleansed with soft soap. The cure is then brought about by the judicious use of parasitocides.

FAWCETT, HENRY (1833-1884), English politician and economist, was born at Salisbury on Aug. 25, 1833, the son of a successful business man. He was educated at King's College school, London, and at Peterhouse and Trinity Hall, Cambridge. He was seventh wrangler in 1856, and was elected to a fellow-

ship at his college. He then entered Lincoln's Inn. His brilliant prospects, however, were shattered when he was blinded by a shooting accident in 1858. Nevertheless he fished, rowed, skated, walked and rode, and even learnt to play cards and at Trinity Hall, Cambridge, he entered cordially into the social life of the college. He now specialized in political economy. He was a loyal follower of Mill, and as a popularizer of his economic theory and a demonstrator of its principles by concrete examples he had no rival. His power of exposition was illustrated in his *Manual of Political Economy* (1863), of which in 20 years as many as 20,000 copies were sold. In 1863, Fawcett stood and was elected for the chair of Political Economy at Cambridge. He was already known in political circles as an advanced Radical, and in 1865 he was elected M.P. for Brighton. In 1867 he married Millicent, daughter of Mr. Newson Garrett of Aldeburgh, Suffolk (see FAWCETT, DAME MILLICENT).

Fawcett was a severe critic of Liberal Administration and protested against the limited scope of the Elementary Education Bill, Gladstone's method of abolishing army purchase, certain grants to the royal family, and methods of Indian finance. In short he was a thorough going radical who was looked at askance by the Liberal Party. Constructively he accomplished some reform in Indian finance methods, and secured public attention to the preservation of commons, and of New Forest and Epping Forest. As an opponent of the Disraeli government (1874-80) Fawcett came more into line with the Liberal leaders. When the Liberal party returned to power in 1880 Gladstone offered Fawcett a place in the new government as postmaster-general (without a seat in the cabinet). He showed himself a most capable head of a public department. To his readiness in adopting suggestions, and his determination to push business through instead of allowing it to remain permanently in the stage of preparation and circumlocution, the public was mainly indebted for five substantial postal reforms:—(1) The parcels post, (2) postal orders, (3) sixpenny telegrams, (4) the banking of small savings by means of stamps, (5) increased facilities for life insurance and annuities. In connection with these last two improvements Fawcett, in 1880, with the assistance of James Cardin, took great pains in drawing up a small pamphlet called *Aids to Thrift*, of which over a million copies were circulated gratis. A very useful minor innovation of his provided for the announcement on every pillar-box of the time of the "next collection." In the post office, as elsewhere, he was a strong advocate of the employment of women. Proportional representation and the extension of franchise to women were both political doctrines which he adopted very early in his career, and never abandoned. He died at Cambridge on Nov. 6, 1884, and was buried in Trumpington churchyard, near Cambridge.

In the great affliction of his youth Fawcett bore himself with a fortitude which it would be difficult to parallel. The kindness evoked by his misfortune, a strongly reciprocated family affection, a growing capacity for making and keeping friends—these and other causes tended to ripen all that was best, and apparently that only, in a strong but somewhat stern character. His acerbity passed away, and in later life was reserved exclusively for official witnesses before parliamentary committees. Frank, helpful, conscientious to a fault, a shrewd gossip, and a staunch friend, he was a man whom no one could help liking.

See Leslie Stephen, *Life of Henry Fawcett* (1885).

FAWCETT, DAME MILLICENT GARRETT, G.B.E. (1847-1929) the eighth child of Newson Garrett, merchant ship-owner of Aldeburgh, Suffolk. Educated at a private school, she married at 20 Professor Henry Fawcett M.P., afterwards postmaster-general. Her husband's blindness and the perfect sympathy between them led to the closest interdependence of their activities. Under his inspiration she wrote an elementary manual on political economy. Since his death in 1884 she has lived in London with her sister Miss Agnes Garrett and her daughter Philippa, who like her father achieved the distinction of being Senior Wrangler at Cambridge.

Her best known work is that begun immediately after marriage and continued for 50 years, as a leader—after the first few years

the chief leader—of the constitutional movement for women's suffrage. The changes it wrought in women's status are typified by the fact that in 1867, after her first speech at the first meeting advocating women's suffrage, she and another were referred to in parliament as "two ladies, wives of members of this House, who had disgraced themselves" by speaking in public. Yet the quality of the supporters whom the movement immediately secured is shown by those who spoke at the same meeting—J. S. Mill, Charles Kingsley, John Morley, Sir Charles Dilke, James Stansfeld, Professor Fawcett.

The work that ensued put a heavy strain on Mrs. Fawcett's predominant qualities—her invincible tenacity of purpose, unfaltering faith in ultimate victory combined with sagacious appreciation of present difficulties, and unfailing humour. Practically every session for 50 years, save when the nation was at war, a Woman's Suffrage bill was introduced into parliament, occasionally to achieve a second reading victory, but always to be talked out, blocked or defeated. Every year's work meant a growing volume of meetings, petitions, processions, press campaigns, etc. After 1905, when the militant suffrage campaign began, this army became divided into two main forces, which fought separately without turning their arms against each other.

Mrs. Fawcett was always passionately patriotic. During the South African War, the Government sent her to investigate the concentration camps for Boer women and children. The report she produced vindicated (her opponents said white-washed) their administration. The outbreak of the World War was the heaviest blow of her political life. Immediately the whole strength of her organization was turned to efforts for "sustaining the vital forces of the nation." In Jan. 1918, the national change of heart towards women's claims for which her patient work had paved the way, was consummated by the passing of the Representation of the People Act, enfranchising about six million women. A year later, her National Union of Women Suffrage Societies having become the National Union for Equal Citizenship, she retired from active leadership. She wrote *The Women's Victory and After* (1919), and *What I Remember* (1924). The order of D.B.E. was conferred on her after the war, and she was given the G.B.E. in 1925. She died in London, Aug. 5, 1929. (E. A. F.)

FAWKES, FRANCIS (1720–1777), English poet and divine, born at Warmsworth, near Doncaster, where his father was rector, and baptized on April 4, 1720. After studying at Jesus college, Cambridge, he took orders, and finally was made one of the chaplains to the princess of Wales. His first publication is said to have been *Bramham Park, a Poem*, in 1745; a volume of poems and translations appeared in 1761; and *Partridge Shooting*, an eclogue, in 1764. His translations of the minor Greek poets—(Anacreon, Sappho, Bion and Moschus, Musaeus, Theocritus and Apollonius)—were celebrated at the time, but they are less likely to be remembered than his song, "Dear Tom, this brown jug, that now foams with mild ale." Fawkes died on Aug. 26, 1777.

BIBLIOGRAPHY.—For his translations see A. Chalmers, *Works of the English Poets*, vol. xx.

FAWKES, GUY (1570–1606), English "gunpowder plot" conspirator, son of Edward Fawkes of York, a member of a good Yorkshire family and advocate of the archbishop of York's consistory court, was baptized at St. Michael le Belfrey at York on April 16, 1570. His parents being Protestants, he was educated at the free school at York. Soon after his father's death his mother re-married. Fawkes's stepfather was connected with many Roman Catholic families, and was probably a Roman Catholic himself, and Fawkes himself became a zealous adherent of the old faith. In 1593 he went to Flanders and enlisted in the Spanish army, assisting at the capture of Calais by the Spanish in 1596 and gaining some military reputation.

The Gunpowder Plot.—In 1604 Thomas Winter, at the instance of Catesby, in whose mind the gunpowder plot had now taken definite shape, introduced himself to Fawkes in Flanders, and as "a confident gentleman," "best able for this business," brought him on to England as assistant in the conspiracy. Shortly afterwards he was initiated into the plot, after taking an oath of secrecy, meeting Catesby, Thomas Winter, Thomas Percy and

John Wright at a house behind St. Clement's (see **GUNPOWDER PLOT** and **CATESBY, ROBERT**). Owing to his being unknown in London, to his exceptional courage and coolness, and probably to his military experience, Fawkes was entrusted with the actual accomplishment of the design and when the house adjoining the parliament house was hired in Percy's name, he took charge of it as Percy's servant, under the name of Johnson. He acted as sentinel while the others worked at the mine in Dec. 1604, and on the discovery of the adjoining cellar, situated immediately beneath the House of Lords, he arranged in it the barrels of gunpowder, which he covered with firewood and coals and with iron bars to increase the force of the explosion. When all was ready in May 1605 Fawkes was despatched to Flanders to acquaint Sir William Stanley, the betrayer of Deventer, and the intriguer Owen with the plot. He returned in August and brought fresh gunpowder into the cellars to replace any which might be spoilt by damp. A slow match was prepared which would give him a quarter of an hour in which to escape from the explosion. For the discovery of the scheme see **GUNPOWDER PLOT**.

Fawkes behaved with the utmost fortitude when arrested. He refused stubbornly to give information concerning his accomplices; on Nov. 8 he gave a narrative of the plot, but it was not till the 9th, when the fugitive conspirators had been taken at Holbeche, that torture wrung from him their names. His signature to his confession of this date, consisting only of his Christian name and written in a faint and trembling hand, is probably a ghastly testimony to the severity of the torture ("per gradus ad ima") which James had ordered to be applied if he would not otherwise confess. He was tried, together with the two Winters, John Grant, Ambrose Rokewood, Robert Keyes and Thomas Bates, before a special commission in Westminster Hall on Jan. 27, 1606. He suffered death in company with Thomas Winter, Rokewood and Keyes on the 31st, being drawn on a hurdle from the Tower to the Parliament House, opposite which he was executed. He made a short speech on the scaffold, expressing his repentance, and mounted the ladder last and with assistance, being weak from torture and illness.

The lantern said to be Guy Fawkes's is in the Bodleian library at Oxford.

Biog.* and authorities cited there. The official account (untrustworthy in details) is the *True and Perfect Relation of the Whole Proceedings against the late most Barbarous Traitors* (1606), reprinted by Bishop Barlow of Lincoln as *The Gunpowder Treason* (1679).

FÁY, ANDREAS (1786–1864), Hungarian poet and author, was born on May 30, 1786, at Kohány (Zemplin), and studied law at the Protestant college of Sárospatak. His *Mesék* (*Fables*), first published at Vienna in 1820, caused him to be regarded as the Hungarian Aesop. He wrote numerous poems, plays, romances and tales. In 1835 Fáy was elected to the Hungarian diet, and for a time led the opposition. He died on July 26, 1864.

His earlier works were collected at Budapest (8 vols., 1843–44). His poems appear in the collections *Bokréta* (*Nosegay*) (Budapest, 1807) and *Fris Bokréta* (*Fresh Nosegay*) (Budapest, 1818). His *Mesék* were translated into German by Petz (Raab, 1821), and partly into English by E. D. Butler, *Hungarian Poems and Fables* (1877).

FAYAL, a Portuguese island forming part of the Azores archipelago. Pop. (1920) 19,009; area, 63 sq.m. Fayal, i.e., "the beech wood," was so called from the former abundance of the *Myrica faya*, which its discoverers mistook for beech trees. It has an excellent harbour at Horta (q.v.), a town of 5,718 inhabitants. Cedros (3,014) and Feteira (1,760) are the other chief towns. The women of Fayal manufacture fine lace from the agave thread. They also execute carvings in snow-white fig-tree pith, and carry on the finer kinds of basket-making. A small valley, called Flamengos, perpetuates the name of the Flemish settlers, who have left their mark on the physical appearance of the inhabitants. (See **AZORES**.)

FAYETTEVILLE, a city of north-western Arkansas, U.S.A., in the heart of the beautiful Ozark mountains, at an altitude of 1,500 ft.; the county seat of Washington county and the seat of the State university. It is on Federal highway 71, and is served

by the Frisco Lines. The population was 5,362 in 1920; 1930 it was 7,394. The University of Arkansas (established 1871) had in 1927-28 an enrolment of over 1,700 in the colleges and 7,000 in other courses. Its School of Medicine is at Little Rock, and its Agricultural, Mechanical and Normal school (for negroes) is at Pine Bluff. Mount Sequoyah, at the eastern edge of town, is the meeting place of the Western Methodist Assembly. A settlement was made here between 1820 and 1825, which in 1828, when the county was created, became the county seat, under the name of Washington Courthouse, changing its name to Fayetteville in 1829. It was incorporated in 1841; received a city charter in 1859, which was abolished by act of the legislature in 1867; was re-incorporated as a town in 1869; and in 1906 again became a city. At the opening of the Civil War the sympathies of the citizens were mainly with the Confederate cause. The town was raided by Federal cavalry on July 14, 1862, and was occupied by Federal troops later in the year. It was attacked by Confederate cavalry April 18, 1863, but they were driven off; was burned in Aug. 1863; and was shelled by a detachment of Gen. Price's army on Nov. 3, 1864. A National cemetery here contains 1,375 graves, and a Confederate cemetery, 725.

FAYETTEVILLE, a city of North Carolina, U.S.A., at the head of navigation on the Cape Fear river, 80m. from the ocean; the county seat of Cumberland county. It is served by the Aberdeen and Rockfish, the Atlantic Coast Line, and the Norfolk Southern railways, and by steamers to Wilmington, at the mouth of the river. The population was 8,877 in 1920 (38% negroes) and it was 13,049 in 1930 by the Federal census. It has numerous cotton mills and other factories, and a large shipping trade in naval stores, cotton, lumber and garden truck. A State normal school for negroes is situated here, and 10m. N.W. is Ft. Bragg, an important army post, with the largest artillery range in the country. This region was settled by Highlanders between 1729 and 1747, and a village called Cross Creek was within the present limits of Fayetteville. In 1762 a town was laid out, including Cross Creek, and was named Campbelltown, and in 1784, when Lafayette visited the town and spoke from the balcony of the town hall, the name was changed to do him honour. The Scottish heroine Flora McDonald, with her husband and children, spent most of the year 1775 here. Fayetteville was one of four towns that aspired to be the State capital. The general assembly met here in 1787, 1788 and 1789, and here in 1789 the Federal Constitution was ratified. At the outbreak of the Civil War there was a U.S. arsenal in the town, containing 37,000 muskets and a complete equipment for a battery of light artillery, and it was promptly seized by the State authorities. In March, 1865, Gen. Sherman entered the town, destroying the arsenal and considerable property. In the early part of the 19th century Fayetteville was a great inland market for western North Carolina, eastern Tennessee and south-western Virginia. It was chartered as a city in 1893.

FAYOLLE, MARIE ÉMILE (1852-1928), French soldier, entered the Polytechnique in 1873, joined the 16th regiment of artillery in 1875, entered, in 1889, the École de Guerre, where he was professor (of the artillery course), 1897-1907, and where, against orthodox opinion, he urged the importance of concentration of fire and the obstacle it offered to an attacker. Made a general of brigade in 1910, Fayolle, on the outbreak of the World War, was given command of the 70th reserve division, which, with the 77th, formed under Gen. Pétain the III. army Corps and played a brilliant part in the offensive of May 1915. In June 1915 Fayolle was given command of the XXXIII. Corps, which he directed during the attack at Souchez and Vimy of Sept.; in Feb. 1916 he was given the VI. Army which took part in the battle of the Somme; and in May 1917 succeeded Pétain at the head of the Centre Group of armies (holding the Champagne and Verdun fronts). After a few weeks in Italy he was recalled in Feb. 1918 in expectation of the German offensive, and in March took command of all the forces engaged between Péronne and Barisis—the Reserve Army Group—and definitely checked by March 31 the German attempt to break through; he also carried out the two great offensives of July 18 and Aug. 8, 1918, and after the armistice was entrusted with the occupation of the Rhine prov-

inces. Gen. Fayolle became a marshal of France on Feb. 21, 1921. He died on Aug. 27, 1928.

FAYRER, SIR JOSEPH, BART. (1824-1907), English physician, born in Plymouth on Dec. 6, 1824, was a member of the Indian medical service, and on his return to England acted as president of the medical board of the India Office from 1874 to 1895. In 1896 he was created a baronet. Sir Joseph Fayrer wrote much on the practice of medicine in India, and was especially known for his studies on the poisonous snakes of that country and on the physiological effects produced by their virus (*Thanatophidia of India*, 1872). This book is the standard work on the subject, and is illustrated by splendid plates drawn from the life by members of the Calcutta School of Art. He read before various learned societies important papers on tropical medicine and on epidemiology. Other important works by him are: *Clinical and Pathological Observations in India* (1873); *Epidemiology of Cholera* (1888). In 1900 appeared his *Recollections of my Life*. He died at Falmouth on May 21, 1907.

FAYUM, a mudiria (province) of Upper Egypt, having an area of 669 sq.m. and a population (1917) of 507,617. The capital, Medinet-el-Fayum, is 81 m. S.S.W. of Cairo by rail. The Fayum proper is an oasis in the Libyan desert, connected with the Nile by the Bahr Yusuf, which reaches the oasis through a gap in the hills separating the province from the Nile valley. South-west of the Fayum, and forming part of the mudiria, is the Gharak depression. Another depression, entirely barren, the Wadi Rayan, covering 280 sq.m., lies west of the Gharak. The whole region is below sea-level, and save for the gap mentioned is encircled by the Libyan hills. The lowest part of the province, the north-west end, is occupied by the Birket el Kerun, or Lake of the Horns, whose surface level is 140 ft. below that of the sea.

Differing from the typical oasis, the fertility of which depends on the water obtained from springs, the cultivated land in the Fayum is formed of Nile mud which is brought down by the Bahr Yusuf, and distributed from it by irrigation canals. Over 400 sq.m. of the Fayum is cultivated, the principal crops being cereals and cotton. The completion of the Assuan dam by ensuring a much fuller supply of water enabled thousands of acres of land to be brought under cultivation. Three crops are obtained in 20 months. The province is noted for its figs and grapes, the figs being of exceptionally good quality. Olives are also cultivated. Rose trees are very numerous and most of the attar of roses of Egypt is manufactured in the province. The Fayum also possesses an excellent breed of sheep. Lake Kerun abounds in fish.

Medinet-el-Fayum (or Medina), the capital of the province, is a great agricultural centre, with a population (1917) of 44,400. Mounds north of the town mark the site of Arsinoë, earlier Crocodilopolis, where was worshipped the sacred crocodile kept in the Lake of Moeris (*q.v.*). Besides Medina there are several other towns in the province, among them Senuris and Tomia to the north of Medina and Senaru and Abuksa on the road to the lake, some of which are served by railways. There are also, especially in the neighbourhood of the lake, many ruins of ancient villages and cities. Miss Caton-Thompson has recently (1925 onwards) inaugurated a fresh investigation of the Fayum, with important consequences for the study of the physical geography and prehistoric archaeology; these results are still in process of elucidation.

See H. J. L. Beadnell, *The Topography and Geology of the Fayum Province of Egypt* (Cairo, 1905); "Preliminary Report on Neolithic Pottery and Bone Implements from the Northern Fayum" in *Man* (1925, no. 96).

FAZOGLI, a district in the Sennar division of the Anglo-Egyptian Sudan. It forms part of the foot-hills of the Abyssinian plateau and is traversed by the Blue Nile and its affluent the Tumat. Immediately south are the Beni Shangul gold washings in Abyssinia. The inhabitants of Fazogli are Berta and other Shanggalla tribes with an admixture of Funj blood, the country having been conquered by the Funj rulers of Sennar at the close of the 15th century. There are also Arab settlements: Fazogli, on the Blue Nile near the Tumat confluence, and nearer the Abyssinian frontier is the prosperous town Kiri. Abu Shaneina on the Nile below Fazogli is the place where the trade route from Beni

Shangul strikes the river. The chief imports from Abyssinia are coffee, cattle, transport animals and gold. Durra and tobacco are the principal crops.

FAZY, HENRI (1842–1920), Swiss statesman and historian, great-nephew of James Fazy, was born at Berne on Jan. 31, 1842. Fazy was a prominent figure in Genevese politics from 1868 onwards. His proposal to separate Church and State in Geneva was rejected by the people in 1880, but finally accepted in 1907. He was a member of the Swiss *conseil national* from 1896 to 1899, and from 1902 onwards. After the Radical defeat of 1918 he was the only member of his party who remained in office, but he became more and more conservative as time went on. For many years he was the archivist of Geneva, and also professor of Swiss history at the university of Geneva (1896–99, and from 1902). He died at Geneva on Dec. 22, 1920. He was the author of many historical works, chiefly connected with the town and canton of Geneva.

FEALTY: *see* FEUDALISM; SEIGNORY.

FEASTS AND FESTIVALS. A festival or feast is a day or series of days specially and publicly set apart for religious observances. Whether its occurrence be casual or periodic, whether its ritual be grave or gay, carnal as the orgies of Baal and Astarte, or spiritual as the worship of a Puritan Sabbath, it is to be regarded as a festival or "holy day" as long as it is professedly held in the name of religion. The most savage of tribes celebrate funeral feasts, some of them month by month or at regular longer intervals; the ancient Egyptians had three festivals of the seasons, twelve festivals of the month and twelve festivals of the half-month; the Athenians had their annual *Νεκυσια* or *Νεμεσσαι*, the Romans their *Feralia* and *Lemuralia* and the Parsees, Chinese and other Orientals had festivals at stated periods.

But not all such festivals were held in honour of the dead. Many were purely seasonal, thanksgiving for good harvest, propitiation feasts against feared calamities, etc. The ancient Aztecs of Mexico, the Peruvians, the Egyptians, the Celts, the Teutons, Aryans and Semitic peoples all developed, along with the Calendar System, a well-organized series of feasts and festivals.

Greek Festivals.—Perhaps the annual Attic festival in honour of Erechtheus alluded to in the *Iliad* (ii. 550) ought to be regarded as an instance of ancestor-worship; but the seasonal character of the *ἑορτή* or new-moon feast in *Od.* xx. 156, and of the *θαλυσια* or harvest-festival in *Il.* ix. 533, is generally acknowledged. But the earlier Greek calendar was a comparatively simple one; it later developed into so complicated a catalogue of feast- and holy-days that holidays came to be in excess of working days (Strabo). Each *demos* of ancient Greece during the historical period had its own local festivals. For the great national *πανηγύρεις*—Olympian, Pythian, Nemean and Isthmian—*see* the article GAMES, CLASSICAL. *See also* CALENDAR: *Greek Calendar*.

Roman Festivals.—For the purpose of holding *comitia* and administering justice, the days of the Roman year were regarded as being either *dies fasti* or *dies nefasti*—the *dies fasti* being the days on which it was lawful for the praetors to administer justice in the public courts, while on the *dies nefasti* neither courts of justice nor meetings of *comitia* were allowed to be held. Some days were *fasti* during one portion and *nefasti* during another; these were called *dies intercesi*. For the purposes of religion a different division of the year was made; the days were treated as *festi* or as *profesti*,—the former being consecrated to acts of public worship, such as sacrifices, banquets and games, while the latter (whether *fasti* or *nefasti*) were not specially claimed for religious purposes. The *dies festi* or *feriae publicae* were either *stativae*, *conceptivae* or *imperativae*. The *stativae* were such as were observed regularly, each on a definite day; the *conceptivae* were observed annually on days fixed by the authorities for the time being; the *imperativae* were publicly appointed as occasion called for them. In the Augustan age the *feriae stativae* were very numerous, as may be seen from what we possess of the *Fasti* of Ovid. *See also* CALENDAR: *Roman Calendar*.

Feasts of the Jews.—Of the Jewish feasts which are usually traced to a pre-Mosaic origin the most important and characteristic was the weekly Sabbath, but special importance was also

attached from a very early date to the lunar periods. It is probable that other festivals also, of a seasonal character, were observed (*see* Exod. v. 1). In common with most others, the Mosaic system of annual feasts groups itself readily around the vernal and autumnal equinoxes. In Lev. xxiii., where the list is most fully given, they seem to be arranged with a conscious reference to the sacred number seven (compare Numb. xxviii.). Those belonging to the vernal equinox are three in number; a preparatory day, that of the Passover, leads up to the principal festival, that of unleavened bread, which again is followed by an after-feast, that of Pentecost (*see* PASSOVER, PENTECOST). Those of the autumnal equinox are four; a preparatory day on the new moon of the seventh month (the Feast of Trumpets) is followed by a great day of rest, the day of Atonement (which, however, was hardly a *festival* in the stricter sense of the word), by the Feast of Tabernacles, and by a great concluding day (Lev. xxiii. 36; John vii. 37). There was also a considerable number of post-Mosaic festivals, of which the principal were that of the Dedication (described in 1 Macc. iv. 52–59; comp. John x. 22) and that of Purim, the origin of which is given in the book of Esther (ix. 20 *seq.*) (*see* ESTHER).

Earlier Christian Festivals.—While making it abundantly manifest that Christ and his disciples observed the appointed Jewish feasts, the New Testament nowhere records the formal institution of any distinctively Christian festival. But we have unambiguous evidence of the actual observance, from a very early period, of the first day of the week as a holy day (John xx. 19, 26; 1 Cor. xvi. 2; Acts xx. 7; Rev. i. 10). The 16th canon of the council of Laodicea almost certainly means that solemn public service was to be held on Saturday as well as on Sunday. In other quarters, however, the tendency to regard both days as equally sacred met with considerable resistance. The 36th canon of the council of Iliberis, for example, deciding that Saturday should be observed as a fast-day, was doubtless intended to enforce the distinction between Saturday and Sunday. At Milan in Ambrose's time Saturday was observed as a festival; but Pope Innocent is found writing to the bishop of Eugubium to urge that it should be kept as a fast. Ultimately the Christian church came to recognize but one weekly festival.

Even Origen (in the 8th book *Against Celsus*) enumerates as Christian festivals the Sunday, the *παρασκευή*, the Passover with the feast of the Resurrection, and Pentecost; under which latter term, however, he includes the whole period between Easter and Whitsuntide (*see* the article EASTER). Christmas day and Epiphany were among the later introductions, the feast of the Epiphany being somewhat the earlier of the two. Both are alluded to indeed by Clemens Alexandrinus (i. 340), but only in a way which indicates that even in his time the precise date of Christ's birth was unknown, that its anniversary was not usually observed, and that the day of his baptism was kept as a festival only by the followers of Basilides (*see* EPIPHANY, FEAST OF).

When we come down to the 4th century we find that, among the 50 days between Easter and Pentecost, Ascension Day has come into new prominence. Augustine, for example, enumerates as anniversaries celebrated by the whole church those of Christ's passion, resurrection and ascension, along with that of the outpouring of the Holy Ghost, while he is silent with regard to Christmas and Epiphany.

Later Practice.—In the present calendar of the Roman Catholic Church the number of feast days is very large. Each is celebrated by an appropriate office, which, according to its character, is either duplex, semi-duplex or simplex. A duplex again may be either of the first class or of the second, or a major or a minor. The distinctions of ritual for each of these are given with great minuteness in the general rubrics of the breviary; they turn chiefly on the number of Psalms to be sung and of lessons to be read, on the manner in which the antiphons are to be given and on similar details. The duplicita of the first class are the Nativity, the Epiphany, Easter with the three preceding and two following days, the Ascension, Whitsunday and the two following days, Corpus Christi, the Nativity of John Baptist, Saints Peter and Paul, the Assumption of the Virgin, All Saints, and, for each church, the feast proper to its patron or title and the feast of its dedication.

The duplicia of the second class are the Circumcision, the feast of the Holy Name of Jesus, of the Holy Trinity, and of the Most Precious Blood of Christ, the feasts of the Purification, Annunciation, Visitation, Nativity and Conception of the Virgin, the Natalitia of the Twelve Apostles, the feasts of the Evangelists, of St. Stephen, of the Holy Innocents, of St. Joseph and of the Patrocinium of Joseph, of St. Lawrence, of the Invention of the Cross and of the Dedication of St. Michael. The Dominicae majores of the first class are the first Sunday in Advent, the first in Lent, Passion Sunday, Palm Sunday, Easter Sunday, Dominica in Albis, Whitsunday and Trinity Sunday; the Dominicae majores of the second class are the second, third and fourth in Advent, Septuagesima, Sexagesima and Quinquagesima Sundays, and the second, third and fourth Sundays in Lent.

The calendar of the Greek Church is even fuller than that of the Latin, especially as regards the *ἐορταὶ τῶν ἁγίων*. Thus on the last Sunday in Advent the feast of All Saints of the Old Covenant is celebrated; while Adam and Eve, Job, Elijah, Isaiah, etc., have separate days. The distinctions of ritual are analogous to those in the Western Church. In the Coptic Church there are seven great festivals, Christmas, Epiphany, the Annunciation, Palm Sunday, Easter Sunday, Ascension and Whitsunday, on all of which the Copts "wear new clothes (or the best they have), feast and give alms" (Lane). They also observe, as minor festivals, Maundy Thursday, Holy Saturday, the feast of the Apostles (11th July), and that of the Discovery of the Cross.

In common with most of the churches of the Reformation, the Church of England retained a certain number of feasts besides all Sundays in the year. They are, besides Monday and Tuesday both in Easter-week and Whitsun-week, as follows: the Circumcision, the Epiphany, the Conversion of St. Paul, the Purification of the Blessed Virgin, St. Matthias the Apostle, the Annunciation of the Blessed Virgin, St. Mark the Evangelist, St. Philip and St. James (Apostles), the Ascension, St. Barnabas, the Nativity of St. John Baptist, St. Peter the Apostle, St. James the Apostle, St. Bartholomew, St. Matthew, St. Michael and all Angels, St. Luke the Evangelist, St. Simon and St. Jude, All Saints, St. Andrew, St. Thomas, Christmas, St. Stephen, St. John the Evangelist, the Holy Innocents.

Several attempts have been made at various times in western Europe to reorganize the festival system on some other scheme than the Christian. Thus at the time of the French Revolution, during the period of Robespierre's ascendancy, it was proposed to substitute a tenth day (*Décadi*) for the weekly rest, and to introduce the following new festivals: that of the Supreme Being and of Nature, of the Human Race, of the French people, of the Benefactors of Mankind, of Freedom and Equality, of the Martyrs of Freedom, of the Republic, of the Freedom of the World, of Patriotism, of Hatred of Tyrants and Traitors, of Truth, of Justice, of Modesty, of Fame and Immortality, of Friendship, of Temperance, of Heroism, of Fidelity, of Unselfishness, of Stoicism, of Love, of Conjugal Fidelity, of Filial Affection, of Childhood, of Youth, of Manhood, of Old Age, of Misfortune, of Agriculture, of Industry, of our Forefathers, of Posterity and Felicity. The proposal, however, was never fully carried out, and soon fell into oblivion.

Mohammedan Festivals.—These are chiefly two—the 'Eed es-Sagheer (or minor festival) and the 'Eed el-Kebeer (or great festival), sometimes called 'Eed el-Kurban. The former, which lasts for three days, immediately follows the month Ramadan, and is generally the more joyful of the two; the latter begins on the tenth of Zu-l-Heggeh (the last month of the Mohammedan year), and lasts for three or four days. Besides these festivals they usually keep holy the first ten days of Moharram (the first month of the year), especially the tenth day, called Yom Ashoorā; the birthday of the prophet, on the twelfth day of the third month; the birthday of El-Hoseyn, in the fourth month; the anniversary of the prophet's miraculous ascension into heaven, in the seventh month; and one or two other anniversaries. Friday, called the day of El-Gumah (the assembly), is a day of public worship; but it is not usual to abstain from public business on that day except during the time of prayer.

Hindu and Buddhist Festivals.—In modern India the leading popular festivals are the Holi, which is held in March or April and lasts for five days, and the Dasahara, which occurs in October. Although in its origin Buddhism was a deliberate reaction against all ceremonial, it does not now refuse to observe festivals. By Buddhists in China, for example, three days in the year are especially observed in honour of the Buddha,—the eighth day of the second month, when he left his home; the eighth day of the fourth month, the anniversary of his birthday; and the eighth of the twelfth, when he attained to perfection and entered Nirvāna. In Siam the eighth and fifteenth days of every month are considered holy, and are observed as days for rest and worship. At Trut, the festival of the close of the year, visiting and play-going are universal. The new year (January) is celebrated for three days; in February is another holiday; in April is a sort of Lent, ushering in the rainy season; on the last day of June presents are made of cakes of the new rice; in August is the festival of the angel of the river, "whose forgiveness is then asked for every act by which the waters of the Meinam have been rendered impure." See Bowring's *Siam* and Carné's *Travels in Indo-China and the Chinese Empire*. Copious details of the elaborate festival-system of the Chinese may be found in Doolittle's *Social Life of the Chinese*.

FEATHER, a horny outgrowth of the skin of birds, homologous with the scale of the reptile. The body-covering of all birds is composed of feathers, and by this character alone birds may be distinguished from all other animals.

The most perfect form of feather is made up of a long, tapering rod, fringed on either side, for the greater part of its length,

AFTER PYCRAFT

FIG. 1.—A DETAILED STUDY OF THE MINUTE ANATOMY OF A FEATHER. The section here shown was taken through the barbs of one of the primaries, where, as in the secondaries, the system of interlocking is more perfect than in the smaller body-feathers.

by a secondary series of slender and tapering rods forming an acute angle with the central axis. This fringe is the *vexillum* or "vane." The central axis is divisible into two distinct parts—a hollow, cylindrical, transparent *calamus*, or "quill," the base of which is inserted into the skin, and a solid, quadrangular *rhachis* or "shaft" supporting the vane. At the lower end of the quill is a small hole—the lower *umbilicus*—through which the nutritive pulp passes during the growth of the feather, while at the upper end, where it passes into the shaft, a similar hole will be found—

the upper *umbilicus*—and from this the last remains of the capsules which contained the nutritive pulp may sometimes be seen protruding. If the quill is cut open a series of these capsules will be found fitting one into the other throughout the length of the chamber.

The rods composing the vane are the *rami* or "barbs," and will be found, on microscopic examination, to be lath-shaped and to taper to a point. Each barb supports a double series of *radii*, or "barbules." These "barbules" differ markedly in structure on the two sides of the barb, those pointing towards the tip of the feather—the "anterior barbules"—being ribbon-shaped from the base outwards for about half their length, when they become cut up to form a series of long, delicate hooklets (fig. 1). On the opposite side of the barb the barbules are also ribbon-shaped for about half their length, but the ribbon is curved trough-fashion, so that the whole series of posterior barbules forms a number of deep valleys, and into these the hooklets are thrust so as to catch hold of the upper edges of the troughs, which are set so that the upper edge is towards the upper, and the lower towards the under surface of the feather (fig. 1).

In one of the primary or "quill" feathers of the wing of a crane, each barb of the inner side of the vane was found to bear about 600 pairs of barbules, which would make about 800,000 barbules for the inner web of the vane alone, or more than a million for the whole feather. It is to these hooklets that the closely-knit elastic vanes of the flight feathers and the body feathers are due. Where these are wanting the barbs do not adhere, resulting in a loose "discontinuous" vane such as is found in the plumes of the ostrich.

Many feathers, in addition to the main axis, bear a second, generally much shorter axis, supporting a loose discontinuous vane; this is the "aftershaft" and arises from the under surface of the feather. In the cassowary and emu the aftershaft is as large as the main shaft.

There are several different kinds of feathers—contour feathers, semiplumes, down-feathers, filoplumes and powder-down. Contour feathers are those which form the outline of the body, and are all that can generally be seen. Those which form the "flight feathers" of the wing, and the tail feathers, are the most perfectly developed. Semiplumes are degenerate contour feathers. The down-feathers are generally hidden by the contour feathers: they form in many birds, such as gulls and ducks, a thick under-clothing comparable to the under-fur of seals. In all cases they are loose, soft and "fluffy," the barbs being long and slender, while the barbules are often long and provided with knob-like thickenings answering to the hooklets of the contour feathers; these thickenings help to "felt" the separate down-feathers together, the barbs of one down-feather interlocking with those of its neighbour. Down-feathers do not possess a main axis, all the barbs arising from a common centre. Filoplumes are degenerate structures having a superficial resemblance to hairs, but they always bear a minute vane at the tip. They occur in all birds, in clusters about the bases of contour feathers. In some birds they may project beyond the contour feathers, forming conspicuous white patches, as on the thighs of cormorants. In their early stages of development they often possess a large aftershaft. The eyelashes and bristles round the mouth in many birds appear akin to filoplumes. Powder-down feathers are degenerate down-feathers which secrete a dry, waxy powder. This rapidly disintegrates and becomes distributed over the plumage adding thereto a peculiar bloom. In birds of the heron tribe powder-down feathers have reached a high degree of development, forming large patches on the breast and thighs.

Nestling Down.—The majority of young birds either emerge from the egg clothed in down-feathers, or develop these a day or two afterwards. But this covering, though superficially similar in all, may differ widely in its constitution, even in closely related forms, while only in a few species can the complete history of these feathers be made out.

The tawny owl (*Strix aluco*) is one of these. At hatching, the young is thickly clad in white, woolly down-feathers, of the character known as umbelliform—that is to say, the central axis

or main shaft is wanting, so that the barbs all start from a common centre. These feathers occupy the position of the ultimate contour feathers. They are shortly replaced by a second down-like covering, superficially resembling, and generally regarded as, contour-feathers but of a "semi-plumous" type. They differ from the down-feathers which preceded them in that their barbs spring from a central axis as in typical contour feathers. Feathers of this last description indeed have made their appearance in the shape of the "flight" or quill feathers (*remiges*) and of the tail feathers. This plumage is worn until the autumn, when the adult plumage is assumed. The down-feathers which appear at hatching are known as *pre-pennae* when they precede contour feathers, or *pre-plumulae* when they precede down feathers. The first generation of pre-pennae, in the tawny owl is made up of *proptyles*, while the succeeding plumage is made of *mesoptyles*, and these in turn give place to the *teleoptyles* or adult feathers. The two forms of nestling plumage—pre-pennae and pre-plumulae—may be collectively called "neossoptyles." In the nestling cormorant the down represents pre-plumulae only; in hawks a mixture of pre-pennae and pre-plumulae; in owls pre-pennae only.

As a rule the nestling develops but one generation of neossoptyles, and this generally answers to the mesoptyle plumage.

As development proceeds and the contour feathers make their appearance they thrust the mesoptyle feathers out of their follicles—the pockets in the skin in which they were rooted—and these will often be found adhering to the tips of the contour feathers for many weeks after the bird has left the nest.

The Colours of Feathers.—In variety and brilliancy of colour birds are not surpassed by any other group of animals. Yet the pigments to which these colours are due are few in number, as many resplendent hues are produced by structural peculiarities of the colourless horny surface of the feathers.

The principal colour pigments are (a) *melanin* pigments, derived possibly from the haemoglobin of the blood, or from the blood plasma, and (b) *lipochrome* or "fat" pigments, which are regarded as reserve products; though in birds this is doubtful.

The melanin pigments (*zoomelanin*) occur as granules and give rise to black, brown and grey tones; or they may combine with the lipochrome series.

The lipochrome pigments (*zoonerhythrin* and *zooxanthin*) tend to be diffused throughout the substance of the feather, and give rise respectively to red and yellow colours.

Turacin, found in the quill-feathers of touracoes and elsewhere, is a reddish-purple pigment, containing 5 to 8% of copper. These feathers lose their colour when wet, but regain it on drying.

What effect food may have on colour in birds in a wild state we do not know, but it is significant that flamingoes and linnets in confinement never regain their bright hues following their first moult in captivity. If cayenne pepper be mixed with the food of certain strains of canaries, from the time the birds are hatched onwards, the yellow colour of the feathers becomes intensified, till it takes on a deep orange hue. Bullfinches, if fed on hemp-seed, turn black.

Structural colours include all metallic or prismatic colours, blue, green, white, some yellows, and, in part, glossy black. In metallic feathers the barbules are modified in various ways, frequently to form flattened, overlapping plates or tiles, while the surfaces of the plates are either smooth, finely striated or pitted. But, save in white feathers, beneath this colourless, glazed outer coat there is a layer of pigment.

While in many birds the coloration is a uniform hue or in bands and patches of colour on the breast more or less brilliant, in others it is sombre, and made up of dark longitudinal stripes or transverse bars on a lighter ground. The latter is the more primitive, and there seems good reason to believe that longitudinal stripes preceded transverse bars. This is indicated by the fact that the nestlings of the more primitive groups are longitudinally striped, and that young hawks in their first feather-plumage are so striped, while the adults are barred.

There is also evidence that the evolution of brilliant plumage began with the males, and has, in many cases, been acquired by the females, and lastly by the young, as in the kingfishers. Often

where the parents are alike the young wear a different, duller livery, as in the common starling (*Sturnus vulgaris*). But where the female differs from the male in coloration the young resemble the female. The physiological explanation of complete disappearance of pigment in adult life, e.g., the gannet, is not apparent.

Moulting.—At least once annually birds renew their feathers completely by a process known as a moult. Until the new feathers have attained at least half their full length they are invested in a soft sheath, and, as development proceeds, the sheath breaks up from the tip downwards, so that for a time the new feathers have a brush-like appearance. Generally this replacement takes place gradually, new and old feathers occurring side by side.

The "quill" feathers of the wing and tail are renewed in pairs, so that flight is little impaired, the change taking place in the wing from the wrist inwards, as to the primaries, and from the body outwards, towards the tip of the wing, as to the secondaries. In certain birds, however, as in ducks and rails, all the quill-feathers of the wing are shed at once, so that for some time flight is impossible.

In the penguins this simultaneous moulting is carried still further. The old feathers covering the body are replaced *en masse*.

Some birds moult twice within the year, the additional moult taking place in the spring, as in the warblers (*Sylviidae*). But when this is the case the spring moult is only partial, since the quill feathers of the wings and the tail feathers are not renewed.

At this spring moult a special "nuptial" plumage, commonly conspicuous for its vivid coloration, is often assumed, e.g., godwits, knots, dunlins, and ruffs. This plumage, at first assumed at the mating period by the males only, and doffed soon after the young appear, has been retained in some species for longer and longer periods, so that the succeeding plumage is worn only for a few weeks, as in many ducks, wherein the males, as soon as the young are hatched, assume an "eclipse" dress.

But the assumption at the breeding season of a brilliant plumage is not always due to a moult. In many birds, notably many passerines, this change is brought about by shedding the tips of the feathers, which are duller than the rest. In this way the bright rose pink of the linnet's breast, the blue and black head of the chaffinch, and the black throat and chestnut-and-black markings of the back of the sparrow, are assumed.

The Development of Feathers.—Feathers correspond with the scales of reptiles rather than with the hairs of mammals. They make their first appearance as small papillae in the developing chick at about the sixth day of incubation. Each papilla consists of a cluster of dermal cells—that is to say, of cells of the deeper layer of the skin—capped by cells of the epidermis. These last form a single superficial layer of flattened cells—the *epitrichium*—overlying the cells of the malpighian layer, which are cylindrical in shape and form several layers. The papillae assume a cone-shape with its apex directed backwards, while the base is carried down by the growth of the malpighian cells, so that the cone is sunk in a deep pit. Thereby these malpighian cells become divided into two portions: (1) those taking part in the formation of the walls of the "feather follicle," (2) those enclosed within the cone. These last surround the central mass or core formed by the dermis. This mass constitutes the nutritive pulp for the development of the growing feather, and is highly vascular. The cells of the malpighian layer within the cone now become differentiated into three layers: (1) an inner, extremely thin, forming a delicate sheath for the pulp, and found in the fully developed feather in the form of a series of hollow, transparent caps enclosed within the calamus; (2) a thick layer which

forms the feather itself; and (3) a thin layer which forms the investing sheath of the feather. As growth proceeds the cells of this middle layer arrange themselves in longitudinal rows to form the barbs, while the barbules are formed by a secondary splitting. At their bases these rudimentary barbs meet to form the rachis. Finally the tips of the barbs break through the investing sheath and the fully formed feather emerges. A part of the pulp and malpighian cells remains over after the growth of the two generations of down-feathers, and from this, succeeding generations of adult feathers are developed. The reproductive power of the feather follicle appears almost inexhaustible, since it is not diminished appreciably by age, or restricted to definite moulting periods.

The feathers of birds grow only along certain definite tracts known as *pterylae*, leaving bare spaces or *apteria*. These *pterylae* differ in their conformation in different groups of birds, and hence are of service in systematic ornithology.

The principal *pterylae* are as follows:—

- (1.) The head tract (*pt. capitis*), which embraces the head only.
- (2.) The spinal tract (*pt. spinalis*), which extends the whole length of the vertical column. It is one of the most variable in its modifications. In its simplest form it runs down the back in the form of a band of almost uniform width, but generally it expands considerably in the lumbar region, as in Passeres. Frequently it is divided into two portions; an upper, terminating in the region of the middle of the back in a fork, and a lower, which commences either as a fork, e.g., plover, or as a median band, e.g., swallow.
- (3.) The ventral tract (*pt. ventralis*), which presents almost as many variations as the spinal tract. In its simplest form it runs from the throat backwards in the form of a median band as far as the base of the neck, where it divides, sending a branch to each side of the breast. This branch commonly again divides into a short, broad outer branch which lodges the "flank" feathers, and a long, narrow, inner branch which runs backwards to join its fellow of the opposite side in front of the cloacal aperture. This branch lodges the abdominal feathers. For convenience sake the cervical portions of the spinal and ventral tracts are generally regarded as separate tracts, the *pt. colli dorsalis* and *pt. colli ventralis* respectively.
- (4.) The humeral tract (*pt. humeralis*), which gives rise to the "scapular" feathers.
- (5.) The femoral tract (*pt. femoralis*), which forms an oblique band across the thigh.
- (6.) The crural tract (*pt. cruralis*), which clothes the rest of the leg.
- (7.) The tail tract (*pt. caudalis*), including the tail feathers and their coverts; and
- (8.) The wing tract (*pt. alaris*), which presents many peculiar features. Each segment—arm, forearm and hand—bears feathers essential to flight, and these are divided into *remiges*, or "quill" feathers, and *tectrices*, or "coverts."

The *remiges* of the arm, collectively known as the *parapteron* and *hypopteron*, are composed respectively of long, quill-like feathers forming a double series, the former arranged along the upper, and the latter along the lower aspect of the humerus. They fill up the gap which, in long-winged birds, would otherwise occur during flight between the quill-feathers of the forearm and the body. In short-winged birds they are reduced. The quills of the forearm are known as "secondaries," those of the hand as "primaries." The former are attached to the ulna by their bases at relatively wide distances apart, while the primaries are crowded close together and attached to the skeleton of the hand. Birds which fly much have the outer primaries of great length, giving the wing a pointed shape, as in swifts, while in species which fly little the outer primaries are short, giving the wing a rounded appearance.

The *tectrices* or wing coverts are arranged in several series, decreasing in size from behind forwards. The number of rows on the dorsal aspect and the method of their overlap afford characters of general importance in classification.

The wings of struthious birds differ from those of the Neognathae in many ways. All are degenerate and useless as organs of flight. Those of the ostrich and rhea are the least degraded.

In the ostrich ankylosis has prevented the flexion of the hand at the wrist joint so that the quills—primaries and secondaries—form an unbroken series of about 40 in number. Of these 16 belong to the primary or metacarpo-digital series, a number ex-

FIG. 2.—PTERYLOSIS OF PLOVER
The feathers are clustered together to form well defined tracts or pterylae, separated by spaces called "apteria"

ceeding that of any other bird. The coverts in their disposition, bear a general resemblance to those of neognathine wings; but they differ on account of the length of the feathers and the absence of overlap.

The wing of the rhea more nearly resembles that of flying birds since the hand can be flexed at the wrist joint, and the primaries are 12 in number, as in grebes. The coverts, as in the ostrich, are remarkable for their length. In both ostrich and rhea, as well as in all the other struthious birds, the under surface of the wing is entirely bare. The wing of the cassowary, emu and apteryx has undergone complete degeneration, so that only a vestige of the hand remains. The wing of the penguins has become transformed into a paddle, clothed on both sides with a covering of small, close-set feathers. A pollex is wanting, as in the cassowary, emu and apteryx.

Commercial Applications of Feathers.—The chief purposes for which feathers become commercially valuable may be comprehended under four divisions:—(1) Bed and upholstery feathers; (2) quills for writing; (3) ornamental feathers; and (4) miscellaneous uses.

Bed and Upholstery Feathers.—The qualities which render feathers available for stuffing beds, cushions, etc., are lightness, elasticity, freedom from matting and softness. These are combined in the most satisfactory degree in the feathers of the goose and allied aquatic birds. Goose feathers and down, when plucked in spring from the living bird, are most esteemed. The down of the eider duck, *Somateria molissima*, is valued above all other substances for lightness, softness and elasticity; but it has some tendency to mat, and is consequently more used for quilts and in articles of clothing than unmixed for stuffing beds. The feathers of swans, ducks and the domestic fowl are also largely employed for beds; but in the latter bird, the feathers are harsher and less downy than are those of the natatorial birds generally.

Quills for Writing.—The earliest period at which the use of quill feathers for writing is recorded is the 6th century; and from that time till the introduction of steel pens early in the 19th century they formed the principal writing implements of civilized communities. It has always been from the goose that quills have been chiefly obtained, although the swan, crow, eagle, owl, hawk and turkey all have been laid under contribution. Swan quills, indeed are better than are those from the goose, and for fine lines crow quills have been much employed. Only the five outer wing feathers of the goose are useful for writing, and of these the second and third are the best, while left-wing quills are more esteemed than those of the right as they curve outward and away from the writer using them. Quills obtained in spring from living birds are the best.

Ornamental Feathers.—Feathers do not appear to have been much used in Europe for ornamental purposes till the close of the 13th century; during Elizabeth's reign feathers began to

occupy an important place as head-dress ornaments of women. Ostrich feathers hold a pre-eminent position among ornamental feathers; and the ostrich is the only bird reared exclusively for the sake of its feathers. Ostrich farming is one of the established industries of South Africa, and is also practised in North Africa, Argentina, Arizona and California. The feathers are cut from the living animal and the stumps withdrawn later. In the male, the long feathers of the tail, and wings are white, and the short feathers of the body are jet black; while the tail and wing feathers of the female are white, tinged with a dusky grey. The feathers of the male are consequently much more valuable than those of the female, and are separately classified in commerce. The art of the plumassier embraces the cleaning, bleaching, dyeing, curling and making up of ostrich and other plumes and feathers.

In addition to those of the ostrich, the feathers of certain other birds form articles of steady commercial demand. Among these are the feathers of the South American ostrich, *Rhea americana*, the marabout feathers of India obtained from *Leptoptilus argala* and *L. javanica*, the aigrettes of the heron, the feathers of the various species of birds of paradise, and of numerous species of humming-birds.

Miscellaneous Applications of Feathers.—Quills of various sizes are extensively employed as holders for the sable and camel hair brushes used by artists, etc. Feather brushes and dusters are made from the wing-feathers of the domestic fowl and other birds; those of a superior quality, under the name of vulture dusters, being really made of American ostrich feathers. A minor application of feathers is found in the dressing of artificial fly-hooks for fishing.

(W. P. P.)

FEATHER RIVER. A river of northern California which rises in the Sierra Nevada range and flows in a south-west direction through some of the most beautiful scenery in the State, till it becomes part of the Sacramento. It is only partly navigable.

FEATHER STARS, the popular name for the beautiful star-fish (*q.v.*) of the class Crinoidea (*see* ECHINODERMA), from their branched, feathery arms.

FEATHERSTONE, an urban district in the Normanton parliamentary division of the West Riding of Yorkshire, England, 6 m. E. of Wakefield, and 2½ m. S.W. of Pontefract on the L.M.S. railway. Pop. (1931), 14,952. The industrial population is employed in large collieries. Here, on Sept. 7, 1893, serious riots, during a strike, resulted in the destruction of some colliery works.

FEATLEY or **FAIRCLOUGH, DANIEL** (1582-1645), English divine, was born at Charlton, Oxfordshire, on March 15, 1582. His varied activities included a "scholastick duel" with James I. in 1625, and the publication of (1) the report of a conference with some Jesuits in 1624, (2) a devotional manual entitled *Ancilla Pietatis* (1626), (3) *Mystica Clavis, a Key opening divers Difficult Texts of Scripture in 70 Sermons* (1636). He was appointed provost of Chelsea College in 1630, and in 1641 was one of the sub-committee "to settle religion." He sat in the Westminster Assembly 1643, and was the last of the Episcopal members to remain. For revealing its proceedings he was expelled and imprisoned. He died at Chelsea on April 17, 1645.

FEBRONIANISM, the name given to a powerful movement within the Roman Catholic Church in Germany, in the latter part of the 18th century, directed towards the "nationalizing" of Catholicism, the restriction of the monarchical power usurped by the papacy at the expense of the episcopate, and the reunion of the dissident churches with Catholic Christendom. It was thus, in its main tendencies, the equivalent of what in France is known as Gallicanism (*q.v.*). The name is derived from the pseudonym of "Justinus Febronius" adopted by Johann Nikolaus von Hontheim (*q.v.*), coadjutor bishop of Treves (Trier), in publishing his work *De statu ecclesiae et legitima potestate Romani pontificis*.

Papal Fallibility.—The main propositions defended by "Febronius" were as follows: The constitution of the Church is not, by Christ's institution, monarchical, and the pope, though entitled to a certain primacy, is subordinate to the universal Church. Though as the "centre of unity" he may be regarded as

the guardian and champion of the ecclesiastical law, and though he may *propose* laws, and send legates on the affairs of his primacy, his sovereignty (*principatus*) over the Church is not one of jurisdiction, but of order and collaboration (*ordinis et consociationis*). The Roman (ultramontane) doctrine of papal infallibility is not accepted "by the other Catholic Churches" and, moreover, "has no practical utility." The Church is based on the one episcopacy common to all bishops, the pope being only *primus inter pares*. It follows that the pope is subject to general councils, in which the bishops are his colleagues (*conjudices*), not merely his consultors; nor has he the exclusive right to summon such councils. The decrees of general councils need not be confirmed by the pope nor can they be altered by him; on the other hand, appeal may be made from papal decisions to a general council. As for the rights of the popes in such matters as appeals, reservations, the confirmation, translation and deposition of bishops, these belong properly to the bishops in provincial synods, and were usurped by the papacy gradually as the result of a variety of causes, notably of the False Decretals (*see* DECRETALS). For the health of the Church it is therefore necessary to restore matters to their condition before the False Decretals, and to give to the episcopate its due authority. The main obstacle to this is not the pope himself, but the Curia, and this must be fought by all possible means, especially by thorough popular education (*primum adversus abusum ecclesiasticæ potestatis remedium*), and by the assembling of national and provincial synods, the neglect of which is the main cause of the Church's woes. If the pope will not move in the matter, the princes, and notably the emperor, must act in co-operation with the bishops, summon national councils even against the pope's will, defy his excommunication, and in the last resort refuse obedience in those matters over which the papacy has usurped jurisdiction.

The Revolt of the Princes.—The views of Febronius had but little originality. In the main they were those that predominated in the great general councils of Constance and Basel in the 15th century; but they were backed by him with such a wealth of learning, and they fitted so well into the intellectual and political conditions of the time, that they found a widespread acceptance. The book, indeed, was at once condemned at Rome (February 1764), and by a brief of the 21st of May the pope commanded all the bishops of Germany to suppress it. The papal condemnation met with a very mixed reception; in some dioceses the order to prohibit the book was ignored, in others action upon it was postponed pending an independent examination, in yet others (nine in all) it was at once obeyed "for political reasons," though even in these the forbidden book became the "breviary of the governments." The Febronian doctrine, in fact, exactly fitted the views of the German bishops, which were by no means disinterested. It must be remembered that the bishops were at this time great secular princes rather than Catholic prelates; with rare exceptions, they made no pretence of carrying out their spiritual duties; they shared to the full in the somewhat shallow "enlightenment" of the age. As princes of the Empire they had asserted their practical independence of the emperor; they were irked by what they considered the unjustifiable interference of the Curia with their sovereign prerogatives, and wished to establish their independence of the pope also. In the ranks of the hierarchy, then, selfish motives combined with others more respectable to secure the acceptance of the Febronian position. Among secular rulers the welcome given to it was less equivocal. Even so devout a sovereign as Maria Theresa refused to allow "Febronius" to be forbidden in the Habsburg dominions; her son, the emperor Joseph II., applied the Febronian principles with remorseless thoroughness. In Venice, in Tuscany, in Naples, in Portugal, they inspired the vigorous efforts of "enlightened despots" to reform the Church from above; and they gave a fresh impetus to the movement against the Jesuits, which, under pressure of the secular governments, culminated in the suppression of the society by Pope Clement XIV. in 1773.

Roman Victory.—Whether the "Febronian movement" would have led to a reconstitution of the Roman Catholic Church on permanently Febronian lines must for ever remain doubtful. The

French Revolution intervened; the German Church went down in the storm; and in 1803 the secularizations carried out by order of the First Consul put an end to the temporal ambitions of its prelates. Febronianism, indeed, survived. Karl Theodor von Dalberg, prince primate of the Confederation of the Rhine, upheld its principles throughout the Napoleonic epoch and hoped to establish them in the new Germany to be created by the congress of Vienna. He sent to this assembly, as representative of the German Church, Bishop von Wessenberg, who in his diocese of Constance had not hesitated to apply Febronian principles in reforming, on his own authority, the services and discipline of the Church. But the times were not favourable for such experiments. The tide of reaction after the Revolutionary turmoil was setting strongly in the direction of traditional authority, in religion as in politics; and that ultramontane movement which, before the century was ended, was to dominate the Church, was already showing signs of vigorous life. Moreover, the great national German Church of which Dalberg had a vision—with himself as primate—did not appeal to the German princes, tenacious of their newly acquired status as European powers. One by one these entered into concordats with Rome, and Febronianism from an aggressive policy subsided into a speculative opinion. As such it survived strongly, especially in the universities (Bonn particularly had been, from its foundation in 1774, very Febronian), and it reasserted itself vigorously in the attitude of many of the most learned German prelates and professors towards the question of the definition of the dogma of papal infallibility in 1870. It was, in fact, against the Febronian position that the decrees of the Vatican Council were deliberately directed, and their promulgation marked the triumph of the ultramontane view (*see* VATICAN COUNCIL, ULTRAMONTANISM, PAPACY). In Germany, indeed, the struggle against the papal monarchy was carried on for a while by the governments on the so-called *Kulturkampf*, the Old Catholics representing militant Febronianism. The latter, however, since Bismarck "went to Canossa," have sunk into a respectable but comparatively obscure sect, and Febronianism, though it still has some hold on opinion within the Church in the chapters and universities of the Rhine provinces, is practically extinct in Germany. The ultramontane doctrine of absolute papal supremacy was reasserted in uncompromising form in the Encyclical of 1908 against Modernism, and in the Encyclical of 1927, where the conditions of "Church Reunion" are laid down as unconditional surrender to Rome.

BIBLIOGRAPHY.—*See* Justinus Febronius, *De statu ecclesiæ et legitima potestate Romani pontificis* (Bullioni, 1765), second and enlarged edition, with new prefaces addressed to Pope Clement XIII., to Christian kings and princes, to the bishops of the Catholic Church, and to doctors of theology and canon law; three additional volumes, published in 1770, 1772 and 1774 at Frankfurt, are devoted to vindications of the original work against the critics. In the *Revue des Deux Mondes* for July 1903 (tome xvi. p. 266) is an interesting article under the title of "L'Allemagne catholique," from the papal point of view, by Georges Goyau. For a concise summary with further references, *see* A. Fortescue's article "Febronianism" in Hastings, *Encyclopædia of Religion and Ethics*.

FEBRUARY, the second month of the modern calendar. In ordinary years it contains 28 days; but in bissextile or leap year, it consists of 29 days. This month was not in the Romulan calendar. In the reign of Numa two months were added to the year, namely, January at the beginning and February at the end; in 452 B.C. the decemvirs placed February after January. In February the Lupercalia were held, and women were purified by the priests of Pan Lyceus at that festival. The Anglo-Saxons called this month Sprout-Kale from the sprouting of the cabbage at this season. The most generally noted days of February are the following:—the 2nd, Candlemas day, one of the fixed quarter days used in Scotland; and the 14th, St. Valentine's day.

FEBVRE, ALEXANDRE FRÉDÉRIC (1835–1916). French actor, was born in Paris, and after the usual apprenticeship in the provinces and in several Parisian theatres in small parts, was called to the Comédie Française in 1866, where he made his début as Philip II. in *Don Juan d'Autriche*. In 1894 he toured the principal cities of Europe, and in 1895, of America. He married Mlle. Harville, daughter of one of his predecessors at the Comédie Française, herself a well-known actress. He died in Paris

on Dec. 14, 1916.

FÉCAMP, a seaport and bathing resort of northern France, in the department of Seine-Inférieure, 28 m. N.N.E. of Havre on the Ouest-État railway. Pop. (1926) 16,015. The town stands at the mouth of the small river Fécamp, and occupies the bottom and sides of a narrow valley opening out between high cliffs.

The town grew up round the nunnery founded in 658 to guard the relic of the True Blood which, according to the legend, was found in the trunk of a fig-tree drifted from Palestine to this spot, and which still remains the most precious treasure of the church. The original convent was destroyed by the Northmen, but was re-established by Duke William Longsword as a house of canons regular, later converted into a Benedictine monastery. King Richard I. greatly enlarged this, and rebuilt the church. The dukes of Normandy improved the harbour, but later the town was overshadowed by the rising port of Havre.

The abbey church of La Trinité dates mostly from 1175 to 1225, and has a fine central tower and chapel-screens. The *hôtel-de-ville* with a municipal museum and library occupy the remains of the abbey buildings (18th century). The church of St. Étienne (16th century) and the Benedictine liqueur distillery¹, are of some interest. There are a tribunal and chamber of commerce, a board of trade-arbitrators and a nautical school. The harbour is tidal with docks capable of receiving ships drawing 26 ft. at spring-tide, 19 ft. at neap-tide. Fishing for herring and mackerel is carried on and Fécamp sends a large fleet to the codbanks of Newfoundland and Iceland. The chief exports are oil-cake, flint, cod and Benedictine liqueur. Imports include coal, timber, tar, hemp and ground-nuts. Steam sawing, metal-founding, fish-salting, shipbuilding and repairing, and the manufacture of ship's-biscuits and fishing-nets are among the industries.

FECHNER, GUSTAV THEODOR (1801-1887), German experimental psychologist, was born on April 19, 1801 at Gross-Särchen, Lower Lusatia, where his father was pastor. He was educated at Dresden and Leipzig, where he spent the rest of his life. In 1834 he was appointed professor of physics, but, because of an affection of the eyes, turned in 1843 to the study of mind and the relations between body and mind. He died at Leipzig on Nov. 18, 1887. His chief works are: *Das Büchlein vom Leben nach dem Tode* (1836, Eng. trs. 1882); *Nanna, oder über das Seelenleben der Pflanzen* (1848); *Zendavesta, oder über die Dinge des Himmels und des Jenseits* (1851); *Über die physikalische und philosophische Atomenlehre* (1853); *Elemente der Psychophysik* (1860); *Vorschule der Ästhetik* (1876); *Die Tagesansicht gegenüber der Nachtansicht* (1879). Besides chemical and physical papers, he wrote poems and humorous pieces, such as the *Vergleichende Anatomie der Engel* (1825), written under the pseudonym of "Dr. Mises."

Fechner's epoch-making work was his *Elemente der Psychophysik* (1860). He starts from the Spinozistic thought that bodily facts and conscious facts, though not reducible one to the other, are different sides of one reality. His originality lies in trying to discover an exact mathematical relation between them. The most famous outcome of his inquiries is the law known as Weber's or Fechner's law which may be expressed as follows:—"In order that the intensity of a sensation may increase in arithmetical progression, the stimulus must increase in geometrical progression." Though holding good within certain limits only, the law has proved immensely useful. Unfortunately, from the tenable theory that the intensity of a sensation increases by definite additions of stimulus, Fechner was led on to postulate a unit of sensation, so that any sensations might be regarded as composed of n units. Sensations, he argued, being representable by numbers, psychology may become an "exact" science. His general formula for getting at the number of units in any sensation is $I = C \log S$, where I stands for the sensation, S for the stimulus numerically estimated, and C for a constant that must be separately determined by experiment in each particular order of sensi-

bility. The fundamental mistake in this theory lies in the fact that though stimuli are composite, sensations are not. The idea of the exact measurement of sensation, however, has been a fruitful one, and mainly through his influence on Wundt, Fechner was the father of that laboratory psychology which investigates human faculties with scientific apparatus. His general philosophy conceives the world as highly animistic, even plants and the stars being animated; God, the soul of the universe, has an existence analogous to men, and natural laws are just the modes of the unfolding of God's perfection. Fechner was remotely a disciple of Schelling, learnt much from Herbart and Weisse, and decidedly rejected Hegel and the monadism of Lotze.

BIBLIOGRAPHY.—See W. Wundt, *G. Th. Fechner* (Leipzig, 1901); J. E. Kuntze, *G. Th. Fechner* (Leipzig, 1892); K. Lasswitz, *G. Th. Fechner* (Stuttgart, 1896); E. B. Titchener, *Experimental Psychology* (New York, 1905); G. F. Stout, *Manual of Psychology* (1898); Liebe, *Fechners Metaphysik, im Umriss dargestellt* (1903); H. Adolph, *Die Weltanschauung G. T. Fechners* (Stuttgart, 1923).

FECHNER'S LAW, in psychology, states that the intensity of a sensation (I) varies with the logarithm of the strength of the stimulus (S), or briefly $I = C \log S$, when C is a constant which is different for different sensations (seeing, hearing, etc.), or even for the same kind of sensation in the case of different individuals. This law is sometimes combined with *Weber's Law* (*q.v.*), from which it is derived, and called the *Weber-Fechner Law*. (See *PSYCHOLOGY*.)

FECHTER, CHARLES ALBERT (1824-1879), Anglo-French actor, was born, probably in London, on Oct. 23, 1824, of French parents. He started as a sculptor, and though he made his début at the Comédie Française in 1844, he returned to his studio; but in 1846 he made a decisive success with a French company in Berlin. Next year he married the actress Eléonore Rabut (d. 1895). For the next ten years he acted successfully in Paris; after 1860 he appeared with great success in London, and in 1870 he went to the United States, where he died on Aug. 5, 1879.

FECKENHAM, JOHN (c. 1515-1584), English ecclesiastic, last abbot of Westminster, was born at Feckenham, Worcestershire. Educated at Gloucester hall, Oxford, as a Benedictine student, he was professed at Evesham. On the surrender of the abbey to the king (1540), he became chaplain to Bishop Bell of Worcester and to Bonner of London, and in 1544 received the living of Solihull. About 1549 Cranmer sent him to the Tower of London, but being released by Mary in 1553, he was made prebendary of St. Paul's, rector of Finchley, then of Greenford Magna, chaplain and confessor to the queen, and dean of St. Paul's (1554). He was sent by the queen to prepare Lady Jane Grey for death, and when Elizabeth was sent to the Tower Feckenham interceded for her, even at the cost of displeasing the queen.

The royal abbey of Westminster having been restored to its primitive use, Feckenham was appointed abbot in 1556. On the accession of Elizabeth, he opposed all legislation for changes in religion, and, when the hour of trial came, refused the oath of supremacy, rejecting also Elizabeth's offer to remain with his monks at Westminster if he would conform to the new laws. The abbey was dissolved (July 12, 1559), and within a year Feckenham was sent by Archbishop Parker to the Tower. After 14 years' confinement, he was released on bail and lived in Holborn, where he devoted himself to works of charity. In 1577 he was committed to the care of Cox of Ely with strict rules for his treatment; and in 1580 he was removed to Wisbeach castle where he died on Oct. 16, 1584.

See E. Taunton, *English Black Monks of St. Benedict* (1897). Bibliography in *Dict. Nat. Biog.*

FEDCHENKO, ALEXIS PAVLOVICH (1844-1873), Russian naturalist and traveller, was born at Irkutsk, Siberia, on Feb. 7, 1844. In 1868 he travelled through Turkestan, the district of the lower Syr-Darya, and Samarkand; and shortly after his return he set out for Khokand, where he visited a large portion of territory till then unknown. Soon after his return to Europe he perished on Mont Blanc while engaged in an exploring tour in Switzerland, on Sept. 15, 1873.

Accounts of the explorations and discoveries of Fedchenko have been published by the Russian Government—his *Journeys in*

¹The liqueur is said to have been made by the monks as far back as 1510; since the Revolution it has been produced by a secular company. The familiar legend D.O.M. (*Deo Optimo Maximo*) on the bottles preserves the memory of its original makers.

Turkistan in 1874, *In the Khanat of Khokand* in 1875, and *Botanical Discoveries* in 1876. See Petermann's *Mittheilungen* (1872-74).

FEDERAL COUNCIL OF EVANGELICAL FREE CHURCHES. This body was formed to give expression to the unity in matters of spiritual principle which had been found to exist among the evangelical free churches of England and to co-ordinate their activities and resources. It represents the denominations as organized corporate bodies. Its aims are convergent with those of the National Council of Evangelical Free Churches (*q.v.*); but its constitution and area of operation are different.

The original document consists of a "Declaratory Statement concerning Common Faith and Practice" (with a preamble) and a Constitution. The "governing body" of the Federation is a Federal Council, consisting of representatives elected annually by the supreme authorities of the federating Churches; but its powers are advisory and not executive except under conditions explicitly defined. See **REUNION (CHURCH)**.

FEDERAL FARM BOARD. The farm relief legislation enacted by the United States Congress in 1929, known as the Agricultural Marketing Act, provides for a Federal Farm Board of eight members, and a revolving fund of \$500,000,000 available for lending to cooperative associations or to stabilization corporations owned by cooperatives, to carry out the purpose of the act—the purpose being "to promote the effective merchandising of agricultural commodities" so that "agriculture will be placed on a basis of economic equality with other industries" and "to protect, control and stabilize" the marketing of agricultural commodities.

The Board is instructed to invite the cooperative associations handling any agricultural commodity to establish an advisory commodity committee of seven members to represent such commodity before the Board. It is authorized to make loans to assist in marketing, forming clearing house associations, extending the membership of the cooperative association applying for the loan, and enabling the cooperative association to make more favorable cash advances to its members.

Upon application of the advisory committee of any commodity the Board is empowered to recognize stabilization corporations,—that is, corporate marketing agencies owned only by cooperatives—and to advance loans to them for working capital and for controlling any surplus in the commodities which they may be organized to handle. The Board is also authorized to enter into agreements to insure cooperative associations against loss through price declines.

(See **AGRICULTURAL PRICES**; **AGRICULTURAL CREDITS**.)

FEDERAL GOVERNMENT, a form of government of which the essential principle is that there is a union of two or more states under one central body for certain permanent common objects (Lat. *foedus*, a league). In the most perfect form of federation the states agree to delegate to a supreme federal government certain powers or functions inherent in themselves in their sovereign or separate capacity, and the federal government, in turn, in the exercise of those specific powers acts directly, not only on the communities making up the federation, but on each individual citizen. So far as concerns the residue of powers unallotted to the central or federal authority, the separate states retain unimpaired their individual sovereignty, and the citizens of a federation consequently owe a double allegiance, one to the state, and the other to the federal government. They live under two sets of laws, the laws of the state and the laws of the federal government (J. Bryce, *Studies in History and Jurisprudence*, ii. 490). The word "confederation," as distinct from "federation," is usually, though not universally, used to distinguish from such a federal state (*Bundesstaat*) a mere union of states (*Staatenbund*) for mutual aid, and the promotion of interests common to all (see **CONFEDERATION**).

Ancient Federation.—In ancient Greece the most striking fact of political development was the existence of separate city states, each asserting an absolute autonomy, though all spoke practically the same language and shared to some extent in the same traditions, interests and dangers. This insistence on autonomy is most marked in the cases of the more important states,

Athens, Sparta, Argos, Corinth; but Greek history is full of examples of small states deliberately sacrificing what must have been obvious commercial advantage for the sake of a precarious independence. Thus the Spartan hegemony in the Peloponnese was not a federation. The states did, it is true, meet occasionally for discussion, but their relation, which had no real existence save in cases of immediate common danger, was that between a paramount leader and unwilling and suspicious allies. The Athenian empire again was a thinly disguised autocracy. The synod (see **DELIAN LEAGUE**) of the "allies" soon degenerated into a mere form; of comprehensive united policy there was none, at all events after the League had achieved its original purpose of expelling the Persians from Europe.

None the less it is possible, even in the early days of political development in Greece, to find some traces of a tendency towards united action. The Amphictyonic unions had one of the characteristic elements of federation, that they were free sovereign states combining for a particular purpose (see **AMPHICTYONY**). But these unions, at all events in historic times, were mainly concerned with religion, and the authority of the councils did not seriously affect the autonomy of the individual states.

There are, however, examples in Greece proper of unions approaching to real federal unions. The chief Greek federations were those of Thessaly, Boeotia, Acarnania, Olynthus, Arcadia, Aetolia, Achaea, the most important as well as the most completely organized being the Aetolian League and the Achæan League. (See **ACHÆAN LEAGUE**; **AETOLIA**.)

The governing council of the Aetolian League (*τὸ κοινὸν τῶν Ἀιτωλῶν*) was the permanent representative body; there was also a popular assembly (*παναιτωλικόν*), partly of a primary, partly of a representative kind, any one being free to attend, but each state having only one official representative and one vote. Of all the federal governments of Greece, this league was the most certainly democratic in constitution. There was a complete system of federal officers, at the head of whom was a Strategus entrusted with powers both military and civil. This officer was annually elected, and, though the chief executive authority, was strictly limited in the federal deliberations to presidential functions (*cf.* Livy xxxv. 25, "ne praetor, quum de bello consuluisset, ipse sententiam diceret"—the praetor, on a question of war, shall not offer his own opinion). The Achæan League was likewise highly organized; joint action was strictly limited, and the individual cities had sovereign power over internal affairs. There were federal officers, all the military forces of the cities were controlled by the league, and federal finance was quite separate from city finance.

Of ancient federal government outside Greece we know very little, though of the Lycian federation in Asia Minor Strabo informs us that the federation, composed of 23 cities, was governed by a council (*κοινὸν συνέδριον*) which assembled from time to time at that city which was most convenient for the purpose in hand. The cities were represented according to size by one, two or three delegates, and bore proportionate shares in financial responsibility.

The history of Italy supplies a few examples, of which the chief is perhaps the league of the cities of Latium (*q.v.*; see also **ETRURIA**).

See E. A. Freeman, *Hist. of Federal Government in Greece and Rome* (2nd ed., 1893, J. B. Bury), and works quoted in the special articles.

Switzerland.—The Swiss republic is the most fully federal Government of modern Europe. As now constituted it consists of 22 sovereign states or cantons. The government is vested in two legislative chambers, a senate or council of state (*Ständerat*, *Conseil d'État*) in which each Canton has equal representation and a national council (*Nationalrat*, *Conseil National*) chosen on the basis of one member to every 20,000 of the population, the two bodies together constituting unitedly the federal assembly. The executive council (*Bundesrat*, *Conseil Fédéral*) of seven members is elected by the federal assembly for a period of three years, and one of its members is chosen annually, also by the federal assembly, to be president of the council. Though only chairman of the council, with no more power than his colleagues, the

president is also president of the confederation and represents the nation on all ceremonial occasions. The federal council is unique in two respects—in composition, in that the provision that not more than one councillor can come from any canton carries the federal principle into the structure of the executive; and in powers, in that the federal council, whilst responsible to the federal assembly, is of a non-party or inter-party character and does not resign if its policy is rejected by the legislature. Its members are usually re-elected from year to year, and it approaches a council of permanent “heads of departments” more nearly than the cabinet of a parliamentary system. (See SWITZERLAND.)

Germany.—The constitution of Germany under the empire (1871–1918), whilst presenting many aspects peculiar to itself, was so far federal that the *Bundesrat*, in which the component States were represented by their delegates, was “the authoritative representative of the body of German sovereigns and the senates of the free cities” (Woodrow Wilson, *The State*, p. 264). The imperial chancellor was a member of this body, it initiated the bulk of legislation, could veto any bill proposed by the *Reichstag* (popularly elected assembly), and exercised important administrative and judicial functions. But the predominance of Prussian influence in the Constitution was ensured by the unequal representation of the states; whilst the powers of the states were liable in most cases to reduction by the federal legislature even without their own consent. The present constitution of the German republic approaches still more nearly to a unitary type. The predominance of Prussia has been greatly reduced, and every state has at least one vote in the *Reichstag* though, apart from this provision, representation in this body is on a population basis. But the principle of popular sovereignty is explicitly asserted, and the *Reichsrat* has only a limited veto upon the legislation of the *Reichstag* (Art. 74). Further the provisions of the Constitution defining the powers of the *Reich* are so widely drawn as to leave little scope for State activity. German writers are themselves divided upon the question whether the constitution is federal or unitary; it is in fact a compromise between advocates of the two systems in which the supporters of a unitary democracy have gained more than their rivals. (See R. Brunet, trans. J. Gollomb, *The German Constitution*, 1923.)

The United States.—The United States of America in some respects resembles the Swiss federation, though retaining marks of its English origin. The original 13 states were colonies wholly independent of each other. By the articles of confederation and perpetual union adopted by the Continental Congress in 1777, and in effect in 1781–89, the states bound themselves in a league of common defence. By the written Constitution, drafted in 1787 and in operation since 1789, a stronger and more centralized union was established—a federal republic formed by the voluntary combination of sovereign states. A common citizenship was recognized for the whole union; but the federal government was to exercise only such powers as were expressly delegated to it (amendment of 1791). These powers are, however, much more extensive than those enjoyed by the Confederation, and the Federal Government acts directly upon the citizens through its executive judicial officers. The powers of the central government are entrusted to three distinct authorities—executive, legislative and judicial. The president, elected for a term of four years by electors chosen for that purpose by each state, is the executive head of the republic. He chooses and dismisses his own cabinet, members of which are responsible to the president and not to the legislature for the policy and administration of their departments. The vice-president, *ex officio* president of the senate, assumes the presidency in case of resignation or death. Legislative power is vested in a Congress consisting of two Houses: a senate, composed of two members elected by each state for a term of six years; and a House of Representatives, consisting of representatives in numbers proportionate to the population of each state, holding their seats for two years. The supreme judicial authority is vested in a supreme court, which consists of a chief justice and eight associate justices, all appointed for life by the president, subject to confirmation by the senate.

Other Federations.—The extension of responsible government to the chief British colonies, under a governor or viceregal representative of the crown, has been followed in British North America by the union of the Canadian maritime and Pacific provinces under a federal government—with a senate, the members of which are nominated by the crown, and a house of commons elected by the different provinces according to their relative population. The governor-general is appointed by the Crown for a term of five years, and represents the sovereign in all matters of federal government. The lieutenant-governors of the provinces are nominated by him; and all local legislation is carried on by the provincial parliaments.

The Commonwealth of Australia (*q.v.*) proclaimed in 1901, is another interesting example of self-governing states federating into a united whole. There is, however, a striking difference to be observed in the powers of the federal governments of Canada and Australia. The federal parliament of Canada has jurisdiction over all matters not specially assigned to the local legislatures, while the federal parliament of Australia has only such jurisdiction as is expressly attributed to it by the constitution, the states retaining legislative control over all subjects not thus expressly withdrawn from them. This jurisdiction is undoubtedly extensive, comprising power to legislate concerning trade and industry, criminal law, taxation, quarantine, marriage and divorce, weights and measures, legal tender, copyrights and patents, and naturalization and aliens. Moreover the federal principle of equal representation of the States in one house of the legislature is carried out in the Commonwealth act, but was only partially followed in the British North America act.

There was also an early attempt to federate the South African colonies, and an act was passed for that purpose (South African Act, 1877), but it expired on Aug. 18, 1882, without having been brought into effect by the sovereign in council; in 1908, however, the Closer Union movement (*see* SOUTH AFRICA) ripened, and in 1909 the South African act was passed which set up a Union instead of a Federation, though, as in the senate, some quasi-federal characteristics were adopted.

BIBLIOGRAPHY.—T. Woodrow Wilson, *The State* (1889), revised to Dec. 1918 by E. Elliott (1919); J. Bryce, *Modern Democracies* (1921); H. E. Egerton, *Federations and Unions in the British Empire* (1924).

FEDERALIST PARTY, in American politics, the party that organized the national government of the United States under the constitution of 1787. It may be regarded as, in various important respects, the lineal predecessor of the American Whig and Republican parties. The name *Federalists* (*see* ANTI-FEDERALISTS) was first given to those who championed the adoption of the Constitution. They brought to the support of that instrument “the areas of intercourse and wealth” (Libby), the influence of the commercial towns, the greater planters, the army officers, creditors and property-holders generally—in short, of interests that had felt the evils of the weak government of the Confederation—and also of some few true nationalists (few, because there was as yet no general national feeling), actuated by political principles of centralization independently of motives of expediency and self-interest. Most of the Federalists of 1787–88 became members of the later Federalist Party.

The Federalist Party, which may be regarded as definitely organized practically from 1791, was led, leaving Washington aside, by Alexander Hamilton (*q.v.*) and John Adams. A nationalization of the new central government to the full extent warranted by a broad construction of the powers granted to it by the constitution, and a correspondingly strict construction of the powers reserved to the States and the citizens, were the basic principles of Hamilton’s policy. The friends of individual liberty and local government naturally found in the assumption by the central government of even the minimum of its granted powers, constant stimulus to their fears (*see* DEMOCRATIC PARTY); while the financial measures of Hamilton—whose wish for extreme centralization was nowise satisfied by the government actually created in 1787—were calculated to force an immediate and firm assumption by that government, to the limit, of every power it could be held to possess. To the Republicans (Democratic Republicans)

they seemed intended to cause a usurpation of powers ungranted. Hence these measures became the issues on which the first American parties were formed. Their effect was supplemented by the division into French and British sympathizers; the Republicans approving the aims and condoning the excesses of the French Revolution, the Federalists siding with British reaction against French democracy. The Federalists controlled the government until 1801. Having the great opportunity of initiative they organized it in all its branches, giving it an administrative machinery that in the main endures to-day; established the doctrine of national neutrality toward European conflicts; and fixed the practice of a liberal construction of the Constitution—not only by Congress, but above all by the United States Supreme Court, which, under the lead of John Marshall (who had been appointed chief-justice by President John Adams), impressed enduringly on the national system large portions of the Federalist doctrine. These are the great claims of the party to memory.

After 1801 the Federalist Party never regained power. In attempts to do so, it impaired its morale by internal dissension, by intrigues, and by inconsistent factious opposition to Democratic measures on grounds of ultra-strict construction. It took up, too, the Democratic weapon of States' rights, and in New England carried sectionalism dangerously near secession in 1808, and in 1812-14, during the movement, in opposition to the War of 1812, which culminated in the Hartford convention (*see* HARTFORD). It lost, more and more, its influence and usefulness, and by 1817 was practically dead as a national party. It is sometimes said that Federalism died because the Republicans took over its principles of nationality. Rather it fell because its great leaders, John Adams and Alexander Hamilton, became bitter enemies; because neither was even distantly comparable to Jefferson as a party leader; because the party could not hold the support of its original commercial, manufacturing and general business elements; because the party opposed sectionalism to a growing nationalism on the issues that ended in the War of 1812; and, above all, because the principles of the party's leaders (*e.g.* of Hamilton) were out of harmony, in various respects, with American ideals.

The Federalists were charged by the Republicans with being aristocrats and monarchists, and it is certain that their leaders (who were really a very remarkable body of men) distrusted democratic government; that their Sedition law was outrageous in itself, and (as well as the Alien law) bad as a party measure; that in disputes with Great Britain they were true English Tories when contrasted with the friendly attitude toward America held by many English Liberals; and that they persisted in New England as a pro-British, aristocratic social-cult long after they lost effective political influence. In short, the country was already thoroughly democratic in spirit, while Federalism stood for obsolescent social ideas and was infected with political "Toryism."

FEDERAL RESERVE SYSTEM, THE, a United States banking system which began operation on Nov. 16, 1914. The system consists of 12 Federal Reserve Banks, 25 branches, two agencies, and a Government supervisory body sitting in Washington known as the Federal Reserve Board. The 12 Federal Reserve Banks are situated in Boston, New York, Philadelphia, Cleveland, Richmond, Atlanta, Chicago, St. Louis, Minneapolis, Kansas City, Dallas and San Francisco. Every Federal Reserve Bank, with its branches, serves a separate district not coterminous with State boundaries. The Reserve Banks are bankers' banks in

that they perform for the banks of the United States a service similar to that which commercial banks of deposit perform for their customers. They receive deposits from banks, they make loans to banks, they receive and collect checks. In addition, they have power to issue Federal Reserve notes and act as fiscal agents of the U.S. Government. In more technical language, they are banks of issue and rediscount, with somewhat similar powers to the Bank of England, the Bank of France, the Reichsbank and other European banks of issue.

Reasons for Establishment.—Although the United States was among the last of the important countries of the world to establish a bank of issue and rediscount, there is no other country where the needs for such an institution had been so thoroughly demonstrated. The outstanding peculiarity of the U.S. banking system has been its large number of independent banks. Until recent years branch banking had developed hardly at all. By 1914 as many as 27,000 independent banks had been organized, each operated by its own local board of directors and its own separate official staff and each carrying its cash reserve in its own vaults, or in the vaults of other similar banks in large cities. Not only was there this large number of independent banks, but they differed greatly in powers, size and character. About 7,500 of them were national banks, incorporated under laws of the U.S. Government and supervised by the comptroller of the currency, who is a Federal political officer. The others were all created pursuant to the laws of the several States of the Union governing the establishment of banks, which differed widely.

The disadvantages of this system of many independent banks, with their reserves widely scattered or redeposited in city banks, became apparent, not only at every period of serious credit stringency, but also at times of normal seasonal demands for funds. There was no certain means by which a fairly elastic supply of credit and currency could be supplemented at times of stress. Other difficulties arose from the lack of a competent fiscal agent for the Government. Under a plan instituted in 1846, known as the Independent Treasury system, all revenues were paid into the Treasury or a Subtreasury in actual cash, causing stringency, especially as taxes were largely collected at certain seasons of the year. Then the disbursements caused undue plethora of funds. To overcome this the Government deposited money in the national banks. Abuses grew out of that practice. In time of stringency the Government had to take special, and frequently extraordinary, measures. The Treasury thus found itself with many of the responsibilities of a central bank of issue, but without the machinery necessary for fulfilling the duties of such a bank.

The evils arising from the lack of a central bank of issue and rediscount were long recognized in the United States. In 1908 the U.S. monetary commission was appointed by Congress under the chairmanship of Senator Nelson W. Aldrich of Rhode Island and produced an exhaustive report covering monetary conditions in the United States and the experiences of other countries with banks of issue and rediscount. A change of political parties occurred and the recommendations of the Aldrich commission were not adopted. The Federal Reserve Act as passed, represented a series of compromises between the recommendations of the commission and other proposals. The act in its present form was largely a product of the Committee on Banking and Currency of the House of Representatives under the chairmanship of Carter Glass of Virginia. The principal points at which the Federal Reserve Act is a harmonization of differences between divergent interests, are its compromises between national and local interests, between Government and private interests and between banking and business interests.

A Federal System.—Most European countries have a single central bank of issue and rediscount; in the United States a plan more suited to geographical area and psychological peculiarities was found in the establishment of 12 such banks, each serving a different section of the country. Co-ordination in policy and practice between these banks is effected through the Federal Reserve board, a Government body consisting of the secretary of the Treasury as chairman, ex-officio, the comptroller of the currency, ex-officio member, and six additional members appointed by the

President for ten-year terms, one of whom is designated governor, the chief executive officer of the board. This body has important supervisory powers including the issuance of regulations under which the several Reserve Banks conduct their business. Discount rates are established by each Reserve Bank, subject to "review and determination of the Federal Reserve Board."

Public and Private Interests.—Governmental interest in the Federal Reserve system is safeguarded, not only through the supervisory power of the Federal Reserve board, but also through the power of that board to appoint three of the nine directors of each Federal Reserve Bank, for terms of three years, one of these three being designated chairman of the board of each bank and Federal Reserve agent. The other six directors of each Reserve Bank are elected in each district, for terms of three years, by the member banks. All of the stock of the Federal Reserve Banks is held by the member banks, each of which is required by law to subscribe to this stock in an amount equal to 6% of its own paid-in capital and surplus. Each member bank receives interest limited to 6% per annum on its holdings of Federal Reserve stock. Earnings of each Reserve Bank beyond expenses and these limited dividends is paid each year into a surplus fund until that fund equals the subscribed capital of the bank, and beyond that amount 10% of net earnings in excess of expenses and dividends is paid each year into a surplus fund. All remaining net earnings are paid to the U.S. Government as a franchise tax. These provisions relieve Federal Reserve policy from any pressure for profits and make public service the sole aim. Thus the Reserve Banks are privately owned institutions and a majority of their directors are elected by the member banks. The principal executive officer of each bank, the governor, is chosen by the directors. The Reserve Banks are not Government banks, but in view of the supervisory power exercised by the Government, and of the public character of the business conducted by these banks, it might be said that they are quasi-governmental, or quasi-public.

Banking and Business Influence.—The sentence in the Federal Reserve Act specifying the composition of the Federal Reserve board reads, "in selecting the six appointive members of the Federal Reserve board, not more than one of whom shall be selected from any one Federal Reserve district, the President shall have due regard to a fair representation of the financial, agricultural, industrial and commercial interests, and geographical divisions of the country." The act provided also for the creation of a body known as the Federal Advisory council, composed of one representative from each Federal Reserve district, elected annually by the board of directors of the local Reserve Bank, and required to hold at least four meetings each year to question and advise with the Federal Reserve board. This advisory body has been composed largely of bankers.

In the organization of the several Federal Reserve Banks, the relative weight of business and banking interests is specifically provided for. Three of the six directors elected by the member banks, known as class A directors, are to be representative of the member banks, and the other three elected directors (class B) must not be officers, directors, or employés of any bank and at the time of their election must be actively engaged in "commerce, agriculture or some other industrial pursuit." The law also specifies that the three directors appointed by the Federal Reserve board (class C directors) must not be officers, directors, employés, or stockholders of any bank. As a matter of practice business interests have had a majority representation on the directorates of these banks.

Growth of the System.—The Reserve system had modest beginnings. The first function of the Federal Reserve Banks was to receive on deposit the cash reserves of the member banks. Every member bank was required by law to deposit with its Reserve Bank a percentage of its net demand and time deposits, differing according to the location of the bank, as shown in table.

The provisions of the Federal Reserve Act as to membership required all national banks in the respective districts to become members of the system, to purchase stock of the Reserve Bank of the district and to deposit their reserves therein. State banks might become members of the system subject to certain conditions, in-

Banks in	Original Act effective 1914		Amendment of June 21, 1917	
	Net demand deposits	Time deposits	Net demand deposits	Time deposits
	%	%	%	%
Central Reserve cities . . .	18	5	13	3
Reserve cities	15	5	10	3
All other localities	12	5	7	3

Note: Prior to the amendment of 1917, banks were permitted to keep a portion of the required reserve in their own vaults and with other banks.

cluding a minimum requirement as to capital and surplus and a financial condition and character of management satisfactory to the Federal Reserve board. One-third of the banks of the country, with two-thirds of the banking resources, are now members of the Federal Reserve system. The growth of the system may be illustrated by the following figures for membership:—

Number and Resources of Members of the Federal Reserve System

Year (as of June 30)	Number of banks			Resources (in millions)		
	National	State	Total	National	State	Total
				\$	\$	\$
1915	7,598	17	7,615	11,790	97	11,887
1916	7,572	34	7,606	13,920	307	14,227
1917	7,600	53	7,653	16,282	756	17,038
1918	7,700	513	8,213	18,347	6,104	24,451
1919	7,780	1,042	8,822	21,228	8,628	29,856
1920	8,025	1,374	9,399	23,402	10,351	33,753
1921	8,150	1,595	9,745	20,510	10,426	30,936
1922	8,244	1,648	9,892	20,698	11,026	31,724
1923	8,236	1,620	9,856	21,502	12,293	33,795
1924	8,080	1,570	9,650	22,555	13,222	35,777
1925	8,066	1,472	9,538	24,339	14,766	39,105
1926	7,972	1,403	9,375	25,302	15,543	40,845
1927	7,790	1,309	9,099	26,566	16,244	42,810

The principal growth in membership took place during and following the World War period and this is typical of all the operations of the Reserve Banks. With the entry of the United States into the World War in April 1917, there was suddenly thrown upon the Reserve Banks the responsibility for handling Government financial operations and with it a great increase in lending operations, currency payments, check clearings, etc. The sale of huge war loans and short-time Treasury loans made it necessary for the member banks to begin borrowing heavily at the Reserve Banks and, simultaneously, war prices and war wages led to a large demand for additional currency which was met by the issue of Federal Reserve notes. The Reserve system thus was forced into an expansion of function and activity which under normal conditions could have been the result only of many years of growth.

After the conclusion of the war and post-war expansion, there were reductions in the amount of loans to member banks, the amount of Federal Reserve currency in circulation and the size of fiscal agency operations. Other phases of the work continued, however, in increasing volume, as for example, the number of checks handled in the Federal Reserve collection system and the amount of currency received and paid out from day to day. Since check collections and currency operations engage about half of the employés of the Reserve Banks, the expansion of these two functions, along with a number of other activities such as telegraph payments, custody of securities for member banks and services for foreign banks of issue makes the work of the Reserve Banks substantial in amount.

The total number of employees of the Reserve System is now about 10,000. The largest Reserve Bank is that at New York, which employs some 2,400 people and being situated in the country's principal money market carries on between one-quarter and one-third of the system's operations including the handling of all foreign accounts and of a large part of all direct operations in the money market. By the terms of one of the clauses in the McFadden bill which was signed by President Coolidge on Feb. 25, 1927, the charters of the Federal Reserve Banks, which under the

terms of the original act were for a period of 20 years, were made indeterminate and will, therefore, continue indefinitely unless they are terminated by act of Congress.

Results of Operations.—It is too early to pass judgment broadly on the effects of Federal Reserve operations upon the economic life of the United States, but some interesting evidence of the kind of change which has been effected is found in the movement of interest rates. In the first place, the evidence given below appears to show that the tendency has been for funds for business use to be somewhat cheaper, and funds for speculative use to be somewhat dearer than before the establishment of the Reserve system.

Average Open Market Interest Rates—New York

Period	Commercial paper		Stock exchange loans	
	60 to 90 day	4 to 6 months	On call	60 to 90 day
1900 to 1913	4 $\frac{3}{4}$	5 $\frac{1}{2}$	3 $\frac{3}{4}$	4 $\frac{1}{2}$
1915 to 1926	5	5 $\frac{1}{2}$	4 $\frac{3}{4}$	5
1922 to 1926	4 $\frac{1}{2}$	4 $\frac{1}{2}$	4 $\frac{1}{2}$	4 $\frac{1}{2}$

Another interesting change in interest rates is that there now appears to be less difference between interest rates in Eastern cities and those in Western and Southern cities than there was before the system was established. This may in part be due to the natural tendency for interest rates to level out as the country's money markets become more highly organized, but may be ascribed in part at least to Federal Reserve facilities for the free movement of funds from one part of the country to another. Still a third evidence is found in the seasonal movement of money rates. Under the old banking system with its inelastic currency and lack of adequate reserve supplies of credit for emergency use, there was a seasonal credit strain every spring and autumn which became serious when added to an otherwise strained monetary condition. Recent figures show that this seasonal strain has been almost eliminated and interest rates show little tendency to be higher in the spring and autumn than at other times during the year. This is a natural consequence of the capacity to expand bank funds and currency to meet seasonal or unusual needs. In these particulars there is evidence that the Federal Reserve system has corrected certain long experienced defects in the structure of the monetary system.

Discount and Open Market Policy.—In its discount and open market policy the Reserve system has been able, to a certain extent, to profit from the experience of the European banks of issue, but in other directions has had to depend upon the accumulation of its own experience. In its open market operations it has followed the practice of the Bank of England and other banks of issue in influencing the market, at times, by the purchase or sale of Government securities. The purchase of securities has had the effect of making funds available to the market, thus tending to make money conditions easy, and the sale of securities to draw funds from the market, thus tending to make money dearer. Open market operations have been used from time to time largely to prepare the way for or to make effective changes in discount rate. The chief difference from European practice has perhaps been that the Federal Reserve System has published so complete a weekly statement of condition that any changes in holdings of Government securities are immediately obvious and are made the subject of wide popular comment.

In fixing the discount rate, European precedent has proved of limited value, for the discount rate in the United States applies to a wholly different kind of credit instrument. In most European centres prime bankers' acceptances or bills of exchange constitute the principal discounts of the banks of issue. In the United States, however, no such acceptances existed prior to the establishment of the system, and although a considerable volume and market has been developed since that time, largely by the aid of the Reserve Banks, the volume of business done by the Reserve Banks in accepted bills is small compared with other types of advances. The principal means by which the Federal Reserve system makes funds available to the banks and the money market is the loan to

a member bank, which may take the form of a rediscount of customers' promissory notes, or of a discount of the member bank's own collateral note secured by Government obligations or the promissory notes of its customers. The discount rate of a Federal Reserve Bank applies to this kind of paper, and the fixing of the rate is complicated by the fact that banks in different parts of the country may be lending to their customers at rates differing as widely as 4 and 8% or more. Thus, it is impossible for a Federal Reserve Bank to fix its rate above the rate the member bank charges its customers; nor has this proved to be necessary. It has been found from experience that a discount rate a little higher than the rate at which bankers' acceptances are sold in the open market, and a little lower than the rate at which commercial paper is sold in the open market is satisfactory. With the discount rate at that level, member banks appear as a rule to have limited their borrowing to the sums necessary to meet needs of business.

Gold Policy.—Between 1915 and 1924, the gold holdings of the United States increased from slightly under \$2,000,000,000 to \$4,500,000,000, an amount equal to nearly half of the monetary gold of the world. Huge gold imports performed the valuable service of building up an adequate reserve behind the country's expanded credit and currency, and enabling member banks to liquidate much of their indebtedness at the Reserve Banks. While the United States has probably as much as half of the bank deposits of the world and therefore requires a large gold reserve, the present gold stock is probably sufficient to meet the country's needs for several years to come and to meet, in addition, any reasonable demand for gold from abroad.

The presence of this huge gold supply has made it impossible for the Federal Reserve system to follow what are sometimes considered orthodox precedents in its credit policy. Discount rates could not be determined by the need of protecting the country's gold supply. Instead, discount policy has had to be guided on the one hand by the nature and extent of credit expansion in its relation to business, and on the other by the general world gold position. To put the problem in more simple terms, it has been necessary to adopt a discount rate high enough to avoid inflation in the United States and yet low enough so that gold would not be drawn from the countries of Europe and the return to, and maintenance of, the gold standard abroad again be thus imperilled.

It has been the opinion of Federal Reserve authorities that, from the broad point of view of the mutual advantage of all nations, the speedy return of all the nations of the world to the gold standard is of utmost importance, and not only has the credit policy of the Reserve Banks been directed, when consistent with domestic needs, with that end in view, but the Reserve Banks have also, from time to time, made credit arrangements with European banks of issue to support their return to a gold basis. Such an arrangement was made in May 1925, when the Federal Reserve Bank of New York, in association with the other Federal Reserve Banks, agreed to sell the Bank of England up to \$200,000,000 in gold if desired. Credit arrangements were also made in 1926 with the National Bank of Belgium, and in 1927 with the Bank of Poland and again with the Bank of Italy, under which the Federal Reserve Bank of New York, in association with the other Federal Reserve Banks, agreed, if desired, to purchase prime commercial bills from those institutions.

The general scheme of the Federal Reserve system, the functions exercised by the banks and the general methods and policies pursued, incorporate no novel ideas for which European experience does not offer precedent, except for the regional arrangements by which there are 12 banks of issue instead of one. There is nothing in the construction of the Federal Reserve Act which is really experimental except that one unique feature. Many years of experience will be required to test the feasibility of this arrangement, and its success is likely to depend as much upon the personal qualities of the individuals responsible for the management of the system as upon the provisions of the act. (B. S.)

FEDERAL TRADE COMMISSION, THE (U.S.A.)
This was created by Federal legislative enactment in 1914 in response to a demand on the part of the public that the growth

of monopoly in the United States should be checked. Ever since colonial days, "special privilege" in one form or another has organized itself into combinations that have contended with the public at the seat of the Government at Washington as well as in the business world for unfair preferences. The utterances of Washington, Jefferson, Lincoln, Roosevelt and Wilson teem with philippics against them. At certain periods in the country's history, the pressure and revolt of the public has been so great that it has registered itself in Federal legislation. The reason for Federal legislation in addition to State legislation is due to the fact that "special privilege" lays its burden particularly upon interstate commerce over which State laws have practically no control. Moreover, the form which monopoly takes is generally that of a holding company which dominates or entirely controls a great group of subsidiaries who were formerly competing companies. The actions of the holding company seldom, if ever, come under the jurisdiction and control of State laws, since it is usually outside and beyond their jurisdiction and having to do with interstate commerce. The result has been that when the public found it could not get relief or redress from combinations in restraint of trade under their State laws, they have descended upon Congress and demanded some Federal relief.

In 1890, economic concentration in the form of mergers and combines in the railroad and industrial world became so threatening that Congress enacted what has been called the Sherman Act which prohibited under severe civil and criminal penalties every contract or combination of interstate or foreign commerce and every monopolization or attempt to monopolize. The law included criminal penalties, suits in equity to restrain such combinations and actions at law for triple damages by private parties injured thereby. The Sherman Act was strictly interpreted by the U.S. Supreme Court for a number of years, but was not always strictly enforced by the administrative departments of the Federal Government. The result was that while somewhat held in check, monopolies still grew so that in 1902 under the administration of President Roosevelt the public demanded further relief. It was Roosevelt's idea that publicity could cure or at least hold in check the growth of monopoly. This idea also was an outgrowth of an investigation by the Industrial commission, created by Congress in 1898, which recommended greater publicity regarding the operations of corporations and the establishment of some organ of publicity in the Federal Government. The result was the creation of the bureau of corporations, organized in 1903, under the Department of Commerce and Labor. The commissioner of corporations was required to investigate the organization and conduct of corporations and combinations engaged in interstate commerce, excepting common carriers, and to give information about the same to the President, in order to enable him to make recommendations to Congress.

The bureau functioned successfully, but in 1907, when the country was in the throes of a panic, the United States Steel corporation was permitted to absorb its southern competitor, the Tennessee Coal and Iron Company, on the theory that unless this were done, a business panic of tremendous proportions would result. After the money panic had passed and this combine in the steel world existed, there followed another period of similar concentration, mergings and combinations in other lines of industry which again caused the public to demand some greater protection on the part of the Federal Government. The demand was recognized by planks in the platforms of both the Democratic and Republican Parties in the campaign of 1912.

On Jan. 20, 1914, President Wilson made an address before a joint session of Congress, recommending the establishment of a Federal Trade commission. He said he did not wish to see the commission empowered to make terms with monopoly or in any sort to assume control of business. He asserted that the public demanded a commission as an indispensable instrument of information and publicity. It was to be a clearing house for facts by which both the public mind and the mergers of great business undertakings should be guided. It was to be an instrument for doing justice to business where the processes of the courts or the natural forces of correction outside the courts were inadequate

to adjust the remedy to the wrong in a way that would meet all the equities and circumstances of the case. Congress, in turn, enacted the necessary legislation and in 11 words defined the commission's jurisdiction. It declared "that unfair methods of competition in commerce are hereby declared unlawful," and it gave the commission two distinct powers. The first was couched in language similar to that given to the bureau of corporations. In fact, the bureau was transferred to and became a part of the commission. Under this power, the commission could investigate corporations and business and report its findings to Congress, the President or the public at large. It could also, at the request of Congress or either House, or the President or the attorney general make investigations and report the results. The commission, in the industrial world, was to keep the public and the administrative and legislative departments of the Government informed of the conditions in the several industries, and to make special studies and inform Congress. The second great power entrusted to it came into play when, in the interest of the public welfare, the commission deemed it necessary to issue a complaint against any offending business unit that was practising an unfair method of competition against a competitor. It then required the offender to reply and when issue was thus joined, testimony was taken, under oath, relative to the issue involved. The statute required the commission either to dismiss the complaint in the event that the testimony was insufficient to establish an unfair method of competition in interstate commerce, or if a case was made out, to issue an order to cease and desist from the offending method. Approximately 95% of the complaints that have been issued have been based upon charges made by one competitor against another.

It was thought that with this additional power of stopping unfair methods of competition at their very inception, monopoly would thus be checked since most monopolistic tendencies start with unfair methods. The commission had no more than set up the machinery for carrying out its jurisdiction, than it was deluged with complaints by business interests, and has been ever since. The policy of the commission in its earliest days was not to name the offender publicly, but to make findings and issue an order to cease and desist. As this did not seem to halt the practices complained of, the commission changed its procedure and named the offenders publicly when a complaint was issued. The reaction caused considerable protest in the business world because those desiring "special privileges" and those offending against the statute were fearful of the publicity that resulted in an order declaring them unfair. There has been a change to another plan whereby the offender, having been proceeded against, signs a secret stipulation with the commission agreeing not to continue the practice and is permitted to go without further publicity. In the event that he violates the stipulation, complaint against him is generally made public, and the commission proceeds with the trial.

Congress has also entrusted the commission with the enforcement of some of the provisions of the Clayton Act which was passed on Oct. 15, 1914. The purpose of these provisions as it related to the Federal Trade commission was to prevent certain practices which were regarded as lessening competition or tending to monopoly, but which it was feared would not always in themselves be sufficient to bring the person who practised them within the scope of the Sherman Anti-Trust Act. Later on, the commission was given jurisdiction under what is known as the Webb-Pomerene Act, which permits American business interests to associate themselves together solely for the purpose of selling their goods abroad as a single unit and without the restrictions of the Anti-Trust laws.

(H. T.H.)

FEDERATION OF BRITISH INDUSTRIES. Founded in 1916, as a national organization to voice the sectional views of industry, this federation differs from other important commercial organizations in restricting its membership to manufacturers or producers, and such as serve their needs. The members number nearly 2,500 manufacturing firms and 200 associations, which represent all the leading British industries. The federation was recognized in 1923 by the grant of a Royal Charter.

The aims and objects of the federation are adequately summarized in the statement that whatever affects the interests of British

industry, at home or abroad, falls within its scope. It does not, however, deal with questions affecting rates of pay or conditions of labour, nor does it intervene in any matter of purely political party controversy.

The direction of policy is in the hands of a grand council, elected annually. For the purpose of this election, members are divided into 23 main groups, representing the main industries of Great Britain, and the groups in turn into sub-groups, each sub-group covering a subdivision or trade within the industry. The sub-group is the unit for electing the council, receiving representation proportional to the number of workpeople employed by its members. An executive committee, of about 100 representatives, meeting monthly, deals with the less important and more urgent questions, and this too is elected upon a similar proportional basis, the unit in this case being the main group.

Members are organized also upon a geographical basis: the country has been divided into 16 districts, each with a resident secretary serving under a district chairman and committee, and with a representative upon the grand council and executive committee. The federation, being thus organized both by industrial groups and by districts, is enabled rapidly to obtain its members' views upon matters affecting either trades or localities.

The federation has ready access to Ministers and Government departments, with whom it is in continual consultation upon industrial legislation, and gives evidence to all official committees or Royal Commissions reviewing questions of industrial importance. Special committees are engaged in considering taxation as it affects industry, and in advising members upon local rating.

The federation has also constantly to negotiate on behalf of industry with other sections of the community. In conjunction with other important organizations it formed a traders' co-ordinating committee, to co-ordinate the views of industry and commerce upon the difficult questions emanating from the Railways Act, 1921, in negotiations with the railway companies, and before the Railway Rates Tribunal: to this committee the head of the federation's transport department serves as secretary. Similarly, a shipping committee discusses with the shipping conferences questions of freights and shipping facilities, and a contracts committee confers with municipalities and other large contractors in order to standardize conditions of contracts.

Industrial Efficiency.—A further branch of the federation's activities is concerned with aspects of industrial efficiency. Such matters as smoke abatement, the avoidance of river pollution, and electric power supply, are the concern of special committees. Technical committees advise members upon fuel, industrial art and design. The overseas committee devotes attention to all general questions affecting export trade. It is particularly concerned with foreign tariffs upon British goods, and, either through the British Government or by other means, is constantly seeking to obtain modifications which will enable British products more easily to enter foreign markets.

Internationally, the federation has close relations with the national industrial federations in other countries. Visits are exchanged with foreign industrialists, and valuable conversations held upon questions of common interest, such as, e.g., the carrying out of the decisions taken at the World Economic Conference.

Apart from this "policy" work, much attention is devoted to rendering direct services to individual members. Highly qualified experts are in charge of departments dealing with insurance, advertising and publicity, in addition to those already mentioned—taxation, rating, fuel economy, railway transport, shipping—and are prepared to advise upon individual problems as well as upon more general questions. Similarly, an intelligence department is engaged in the supply of miscellaneous information.

Notable assistance is given to exporters by the overseas organization. In addition to its home staff, it is represented in all parts of the world either by duly qualified correspondents, who recommend suitable agents, supply reports on market conditions, forward information upon tariffs, compose difficulties with customers, and generally facilitate export trade. Assistance is given to members desiring to visit foreign markets, by introductions, by obtaining passports, and by settling the details of their itinerary. Advice

is also given in regard to overseas exhibitions. The federation issues a journal—"British Industries"—twice a month.

(D. G. W.)

FEDERER, HEINRICH (1866–1928), a prolific Swiss novelist, was born at Brienz on Oct. 7, 1866, and died at Zürich on April 29, 1928. Destined for the priesthood, he had to give up his pastoral duties on account of his health, and thenceforth devoted himself to literary work. He is one of the most poetic, richest and delectable of the so-called "Heimatkünstler," or authors dealing mainly with native subjects, while his Roman Catholicism introduces a note that is rather unusual in German Swiss literature. His second subject was Italy, especially the Abruzzi. Among the best-known of his novels are *Berge und Menschen* (1911), *Jungfer Therese* (1913), *Das Mätteliseppi* (1916; his own favourite) and *Papst und Kaiser im Dorfe* (1924). His short stories are equally charming, such as *Sisto e Sesto* (1913), an extraordinarily popular little book, and the collection under the title of *Lachwyler Geschichten* (1911). His last work was a volume of reminiscences, *Am Fenster, Jugenderinnerungen* (1927).

FEDERZONI, LUIGI (1878–), Italian politician and journalist, was born at Bologna on Sept. 17, 1878. Educated at the university there, he took to journalism and literature, and for several years was on the staff of the *Giornale d'Italia*, Rome. In politics he was a Conservative, and became a warm supporter of the Nationalist movement. After the Florence Nationalist congress in Dec. 1910, he helped to found the *Idea Nazionale*, at first the weekly and subsequently the daily organ of the Nationalist movement. At the elections of 1913 Federzoni was elected for one of the divisions of Rome. In the Chamber he never missed an opportunity to combat the Socialists, Republicans and Democrats. As soon as Italy intervened in the World War he joined the army as a lieutenant of artillery; he afterwards joined a trench mortar battery and was awarded a medal for valour. Federzoni supported Mussolini when the latter issued his manifesto of Oct. 26, 1922, announcing the march on Rome. In the Cabinet formed by Mussolini five days later Federzoni was Minister for the Colonies. In this capacity he provided for the reconquest of all the Libyan territories evacuated during the War, and proceeded to reorganise the whole colonial administration. After the Matteotti murder in June 1924, Mussolini selected Federzoni for the post of Minister of the Interior. He was minister for the Colonies in 1926–28.

FEE, an estate in land held of a superior lord on condition of the performance of homage or service (*see* FEUDALISM). In English law "fee" signifies an estate of inheritance (*i.e.*, an estate descendable to the heirs of the grantee so long as there are any in existence) as opposed to an estate for life. It is divisible into three species: (1) fee simple; (2) conditional fee; (3) fee tail. (*See* ESTATE.) A fee farm rent is the rent reserved on granting a fee farm, *i.e.*, land in fee simple, to be held by the tenant and his heirs at a yearly rent. Also payment for professional services. (*See* RENT.)

FEEBLE-MINDEDNESS, a term descriptive of a condition of low intelligence. In England the term has been reserved for the highest group of mental defectives, those now called morons in the United States. In America the term covers the entire group of mental defectives. The following definition of feeble-mindedness was adopted by the American Association for the Study of Feeble-mindedness—the only authoritative body on this subject in the United States. Resolved:

"1. That the term, feeble-minded, be used generically to include all degrees of mental defect due to arrested or imperfect mental development as result of which the person so affected is incapable of competing on equal terms with his normal fellows or managing himself or his affairs with ordinary prudence. 2. That the feeble-minded be divided into three classes, viz.: Idiots.—Those so deeply defective that their mental development never exceeds that of a normal child of about two years. Imbeciles.—Those whose mental development is above that of an idiot but does not exceed that of a normal child of about seven years. Morons.—Those whose mental development is above that of an imbecile

but does not exceed that of a normal child of about twelve years.

"This grouping admits of the use of the older pathological terms, such as hydrocephalic, microcephalic, paralytic, etc., as adjectives indicating the respective complications."

As will be seen, this classification accepts the term feeble-mindedness as generic, referring to the entire group of mental defectives; and adopts a new term, moron (Gr. *moros*), for the highest group. The present view is that the moron is not necessarily a person "incapable of competing on equal terms with his normal brothers or of managing his affairs with ordinary prudence." The reason we have had so many morons in the past who did suffer from this incapacity was that they had been improperly trained or educated.

Care and Treatment of Feeble-minded.—It is commonly stated that primitive peoples and the ancients destroyed their mentally defective children. Not until late in the 16th century does human sympathy seem to have been aroused for this defective class and then attention was centred on the cretin, a special form of mental defective due to non-functioning of the thyroid gland. At that time Felix Platten, of Basel, Switzerland, called attention to this group of unfortunates. In the early part of the 17th century, St. Vincent de Paul at the French asylum known as the Bicêtre gave some special attention to idiot children; not, however, until the 19th century was any considerable effort made to care for these cases. In Germany a private school had been established by Dr. Saegert, in Berlin, in 1842. The first school in England was established in 1846 through the efforts of Dr. Parmalee and Dr. Reid, and soon after that came Carchester and Earlswood.

In 1792 a wild boy known later as the "savage of Avéyron" was found in the woods by some hunters. He was trained by Itard, who thought to demonstrate certain philosophical tenets. He was observed in his work by Seguin, who, impressed with the possibilities of educating idiots, opened a private school in Paris in 1837 and devoted the rest of his life to this work. In 1848 he emigrated from France to the United States, and it was largely as a result of his work that institutions for the feeble-minded were started in the United States. In that year, two schools were started in Massachusetts: one, a private school at Barre; the other the beginning of a State institution, which was in connection with the Perkins Institution for the Blind, and was also under the direction of Dr. Howe, who had previously found feeble-mindedness among his blind children in South Boston. The second State institution was established by New York State in 1851. The third was in Pennsylvania in 1852, now known as the Pennsylvania Training school at Elwyn. The fourth institution was established at Columbus, O., in 1857, and the fifth in Connecticut in 1858. Kentucky and Illinois established institutions in 1860 and 1865. Other States followed as their populations increased or their needs developed, until at present there is a State institution in all States except Nevada, Utah, Arizona and New Mexico. There is also an institution in the Territory of Hawaii. The early institutions were influenced largely by Seguin's example and enthusiasm; and they were motivated largely by the impulse to educate or cure the idiot. It was found, however, that there were large groups which were practically incapable of any education. Accordingly, in 1878, an institution was established in Newark, N.Y., for the custodial care of untrainable idiots. The custodial idea then prevailed for some time.

In 1923, the latest census available, there were in institutions in the United States 50,640 feeble-minded persons. This is approximately 5 per 10,000 of the population. About one-half of these are of imbecile grade, one-sixth idiots and one-third morons. It is generally agreed now by students of the problem that 1% of the population need such care. This would be proportionately reduced if the public schools took care of the moron as suggested above. A new epoch began in 1896; at Faribault, Minn., was opened a psychological laboratory for the study of the feeble-minded. Ten years later, in 1906, the Training school at Vineland, N.J., opened a psychological laboratory at that institution which has been in continuous operation. Similar work has been done in various other institutions for short periods. Psychological study

has led to a clearer understanding of the abilities and disabilities of the feeble-minded of the various grades, with the result that their education and training has been established upon a sound scientific basis. Present day ideals for the feeble-minded are stated by saying: The idiot may be trained to make known his physical wants, and to eat a little less like an animal; the imbecile may be trained in the lower grades to a little self help, and in the higher grades to considerable useful work if under careful direction and supervision; the moron may be trained to be an efficient institution helper and even for self support outside the institution, provided his training is begun early enough and done thoroughly enough along right lines.

Types.—Previous to the adoption of the classification above given, much emphasis was laid upon types of mental defectiveness. As already pointed out, work for the feeble-minded began with a consideration of the cretin, a condition endemic in Switzerland and northern Italy, where it is due to an hypertrophied thyroid gland showing as a goitre. In the United States the cretin, or cretinoid, as he should be called, is the result of the congenital absence of the thyroid gland. In either case, the condition is the result of lack of iodine in the food or drinking water. The cretin does not grow, either physically or mentally; he has marked physical characteristics easily recognized. If the condition is discovered early, thyroid extract may be administered, producing the same result as though the child had a normally functioning thyroid gland. Another type of considerable importance is the so-called "mongoloid" or "mongolian," so named because of a fancied resemblance to the northern Asiatic races. This type is congenital, but not hereditary. It is believed to be due to the failure of the mother to nourish the child properly *in utero*. Mongoloids in general have the intelligence about equal to a four-year-old child; rarely they attain to that of an eight-year-old. If understood and carefully treated, they are affectionate, interesting little children, but always little children. The hydrocephalic is the result of the disease hydrocephalus, producing the greatly enlarged head, and as a rule, mental deterioration, varying in all degrees of mentality, even up to normal. The microcephalic, or small head individual, is generally not higher than imbecile grade. The typical feeble-minded person is simply and solely a person whose mind has not developed. He is what the name implies, simply weak or simple minded. There are no peculiarities or typical features, except such as result naturally from the low degree of mentality. Much confusion results from considering extraneous circumstances as essential characteristics of feeble-minded people. There are, it is true, some slight fundamental differences according to what has been the cause of the condition.

Causes.—For many years it was thought that many physical conditions caused feeble-mindedness such as children's diseases, certain fevers, injuries to the head, falls, blows, etc.—and even maternal impressions. As a result of careful studies it is now generally accepted that about two-thirds of all feeble-mindedness is inherited. The remaining third is perhaps the result of early illness, accidents and unknown causes. Of the diseases, meningitis, sleeping sickness and infantile paralysis do cause mental defect sometimes. There is no good evidence that the other diseases formerly listed as causes do in fact have any such consequences. Another supposed cause often cited by the laity is some form of head injury—resulting from a fall or a blow. This seems reasonable until one learns that the brain is not a single organ, injury to any part of which impairs the efficiency of all the rest. In reality the brain is a group of organs, and some of them may be injured without harming the rest. Adults often recover from very severe brain injuries. The effect of similar injuries on a growing child may be thought to have more serious consequences. Nevertheless the symptoms are not usually those of feeble-mindedness. Still more doubtful causes are parental alcoholism and parental syphilis. While it is easy to believe that these conditions may produce any kind of horrible result, as often claimed, as a matter of fact there is no conclusive evidence that either of them causes feeble-mindedness in the offspring. There is always to be found a small percentage of cases where no adequate cause for the condition may be discovered, but these

cases are from neither alcoholic nor syphilitic parents.

Treatment.—The first rule for the treatment of the feeble-minded is to make them happy and to remember that, no matter what their chronological age, they are irresponsible children. It is useless to scold them for their mistakes, because they do not understand. Encouragement for all their good efforts and praise for all their successes is the rule. As to education and training, it must be concrete and definite, manual and industrial training rather than book work. They cannot handle abstractions, or understand general principles. It is useless to teach them rules of morality, for they cannot apply them. The high grades can be trained to do many useful things *under direction*. They can do many kinds of house work and farm work, simple repair work and even use simple machinery, to which they have been thoroughly trained. They do most of the manual work in and about the institutions where they live. This materially reduces the cost of their maintenance. As a rule, these children are happier in an institution than they are in their own homes, because in institutions they are with children of their own mentality and consequently are more comfortable than in their own homes where they are impressed with their inferiority. (H. H. Go.)

FEEDING STUFFS, the materials on which animals feed, may be (i.) grass or other growing crops eaten in the fresh condition; (ii.) the same preserved for winter use by drying or ensiling; (iii.) seeds, or products made from seeds; (iv.) miscellaneous products of various industries dealing with plant or animal materials.

Class (i.) includes such materials as pasture grass, rotation grasses and leguminous crops, rape, mustard, cabbage, kale, turnips, swedes and mangolds. They are characterized by a high content of water—70 to 90%. Of their dry matter, about 40 to 60% is soluble carbohydrate, 20 to 30% fibre, 8 to 20% protein or other nitrogenous substances, and 5 to 10% ash. On account of their high water content they are known as succulents. Those which consist mainly of green leaves supply an abundance of vitamins.

Class (ii.). Permanent and temporary grass is usually preserved by air drying which converts it into hay. Grass should be cut for hay before the flowers set seed; otherwise much of the nutritive material is removed from the leaves and stems and stored in the seeds. These are lost in haymaking and the resulting hay is fibrous and indigestible. When the seeds are allowed to ripen and removed in threshing, as is the case with the cereals and many other crops, the remaining leaves and stems are called straw. Hay and straw are bulky feeding stuffs of low nutritive value. They are commonly called roughages.

Other green crops, *e.g.*, oats sown together with vetches, beans or peas, are often cut green and preserved by compression into a silo after being cut into short lengths in a chaff cutter. This process is known as ensilage, and the product as silage (*q.v.*).

Class (iii.) includes such materials as the cereal grains and their products, the leguminous grains, and the residues which remain after the removal of oil from oil-seeds; *e.g.*, linseed, cotton-seed, palm kernels, copra, etc. Oil-seed residues vary considerably in value according to the method of manufacture. In some cases the husk is removed from the seeds before the oil is separated. The residue is then said to be decorticated. It contains comparatively little indigestible fibre and its nutritive value is relatively high. When the oil is removed simply by pressure, the residue still contains from 5 to 10% of oil, which raises its nutritive value. If the oil is extracted by chemical means, the residue may contain as little as 1% of oil and the nutritive value is correspondingly decreased. The feeding stuffs in this class contain, on the whole, not more than from 10 to 15% of water, and not more than 7 to 8% of fibre. Their content of nutritive materials is therefore high and they are known as concentrated feeding stuffs, or simply concentrates.

Class (iv.) comprises a number of industrial residues, some derived from plants, others from animals. A typical example is fish meal, the dried and ground refuse from the fish-curing industry. It should be made from white fish comparatively free from oil, and should not contain more than 4% of salt. Fish meal

containing more than 4 or 5% of oil is liable to give a fishy taint to the flesh, milk or eggs of animals fed on it.

Dried blood, dried and ground meat and bone residues are other examples of feeding stuffs of animal origin. Separated milk, buttermilk and whey are valuable additions to the diet of growing pigs, commonly used on farms where they are produced. Dried yeast, a waste product of the brewing industry, dried sugar-beet pulp and molasses from the sugar factories, are examples of plant waste products used for feeding animals.

All the four classes mentioned above are commonly described as "straight" feeding stuffs, which implies that they are composed of one easily recognized article. There is, however, a very large trade in feeding stuffs manufactured by mixing together or compounding several articles. Many of them are good, some are bad. They are, however, a stumbling-block to the progressive farmer who wishes to work out rations for his animals on a modern basis, because, their make-up being unknown and perhaps variable, it is not possible to estimate their real nutritive value.

Composition and Use of Feeding Stuff.—Animals require a certain quantity of nutritive material per day which must contain (i.) a certain quantity of protein for repair of the muscles and other working parts of the body, (ii.) a certain quantity of energy-forming materials such as carbohydrates and oils to provide the power to enable them to carry on their normal vital functions. The minimum quantity required for these purposes is called the *maintenance ration*. An animal fed on a bare maintenance ration remains at constant weight and produces nothing, neither growth, nor work, nor milk.

If production is desired, a *production ration* must be given in addition to the maintenance ration, and the amount of the production ration must be estimated in proportion to the amount which it is desired to produce. This method of computing rations has been in general and successful use amongst progressive dairy farmers for some years. Information is now available for computing rations for growth and fattening on a similar basis.

It is obvious that the weight of a feeding stuff is not a measure of its nutritive value. Ten pounds of mangolds containing 90% of water are evidently of less nutritive value than 10 lb. of linseed cake containing only 10% of water. A better measure of nutritive value is obtained by making a chemical analysis to determine the percentages of nutrients—proteins, commonly known as albuminoids or flesh formers, oils or fats, and carbohydrates; and this is the method approved by the Fertilizers and Feeding Stuff Act, which regulates the sale of feeding stuffs.

Percentages of nutrients as determined by chemical analysis do not accurately measure nutritive value, for all the nutrients found by analysis are not digestible, and only that portion of the nutrients which is digested is of value to the animal. Moreover, even the sum of the digestible nutrients in a feeding stuff does not measure accurately its real nutritive value. It must be discounted for the nutrients used up during the processes of digestion and absorption. Kellner first showed 40 years ago how to estimate the real net nutritive value of feeding stuffs by finding how much starch was required to produce in the body of an ox as much fat as was produced by the consumption of 100 lb. of the feeding stuff. He called this figure the starch equivalent of the feeding stuff. Armsby has more recently arrived at similar results by a totally different method. He expresses his figures for net nutritive value as calories of net energy. When expressed in the same units Armsby's figures agree reasonably well with Kellner's. Kellner's starch equivalents are the generally accepted measure of nutritive value in this country. Armsby's figures for net energy are in general use in the United States.

To compute a ration for an animal it is necessary to know:—

1. The live weight of the animal, because the maintenance ration depends on the live weight being proportional to the square of the cube root of the live weight.
2. The amount of growth or milk which it is desired that the animal should produce.
3. The amount of starch equivalent required to produce unit weight or volume of product; *e.g.*, 1 lb. of live-weight increase, or 1 gal. of milk.

4. The maximum capacity of the animal's appetite, usually stated in lb. of dry matter per day or per week.
5. The minimum weight of protein required to keep the working parts of the body in repair, and to provide for growth of working parts in a young animal or for making milk in a milking animal.

Approximate data for the above so far as they have been ascertained are tabulated below for cattle, sheep and pigs. No data are available for the relation between food consumption and work, because there is no practicable method of measuring the work done by a horse or other draught animal.

From these data the ration in terms of starch equivalent is then computed from the equation:—

$\text{Ration} = \text{maintenance ration} + \text{gain in live weight} \times \text{weight of starch equivalent required to make 1 lb. gain} + \text{gal. milk} \times \text{weight of starch equivalent required to make 1 gal. milk.}$

Having computed the ration in lb. of starch equivalent the next step is to calculate the proportion in which the available feeding stuffs must be mixed in order to include within the limits of the animal's appetite the necessary weight of starch equivalent. The weight of digestible protein in the mixture must then be calculated for comparison with the minimum weight shown in the table. If found too low the ration must be adjusted by substituting a feeding stuff rich in protein for part of it. If a little too high, no harm as a rule will result.

In the case of young growing pigs and heavy milking cows it is desirable to calculate the amount of ash in the ration, and it may be necessary to supplement the ration with a mineral mixture. If the ration contains a fair proportion of fresh green food no anxiety need be felt about the risk of deficiency in vitamins, indeed there is in general small risk of vitamin deficiency among farm animals.

The data for computing rations are as follows:

CATTLE—GROWTH AND FATTENING

Live weight.	Appetite, in dry matter per day.	Maintenance ration in starch equivalent per day.	Minimum requirement of digestible protein per day.
cwt.	lb.	lb.	lb.
5 . . .	14½	4	1½
6 . . .	17	4½	1¾
7 . . .	19	5	1¾
8 . . .	20½	5½	1¾
9 . . .	22	6	1¾
10 . . .	23½	6½	1¾
11 . . .	25	7	1¾
12 . . .	26½	7½	1¾
13 . . .	28	7¾	1¾
14 . . .	29½	8¼	1¾
15 . . .	31	8½	1¾
16 . . .	32½	8¾	1¾

Age.	Condition.	Requirement for 1 lb. increase in live-weight lb. starch equivalent.
Years.		
Under 2 . . .	Store	2
	Fresh	2½
About 2 . . .	Store	2½
	Fresh	2¾
Over 2 . . .	Store	2¾
	Fresh	2¾
	Half fat	3
	Nearly fat	4

MILKING

Appetite, especially of heavy milkers, higher than that of other cattle of similar weight.

Maintenance ration, as for other cattle of similar weight.

Minimum requirement of digestible protein, exclusive of that required for milk production, .75 lb. per day.

Production requirement per gal. of average milk, 2.5 lb. starch equivalent including .55 lb. digestible protein.

SHEEP—GROWTH AND FATTENING

Live weight.	Appetite in dry matter per week.	Maintenance ration in starch equivalent per week.	Minimum requirement of digestible protein per week.
lb.	lb.	lb.	lb.
50 . .	11	5.6	1.3
60 . .	13	6.3	1.4
70 . .	15	6.9	1.5
80 . .	17	7.5	1.6
90 . .	19	8.2	1.7
100 . .	20	8.9	1.8
110 . .	21	9.4	1.8
120 . .	22½	10.0	1.8
130 . .	24	10.5	1.8
140 . .	25	11.0	1.8
150 . .	26½	11.5	1.8
160 . .	28	12.0	1.8

Age.	Condition.	Requirements for 1 lb. increase in live-weight lb. starch equivalent.
Months.		
Under 3 . . .	Store	1
2-6 . . .	Store	1½
6-7 . . .	Store	2
7-8 . . .	Store	2½
8-9 . . .	{ As winter fattening progresses }	2¾
9-10 . . .		2¾
10-11 . . .		3¼
11-12 . . .		3½

EWES SUCKLING LAMBS

Appetite, higher than that of other sheep of same weight.

Maintenance ration, as for sheep of similar weight.

Production requirement, per ewe per week, 3 lb. starch equivalent including 1 lb. digestible protein for each gallon of milk per week.

PIGS—GROWTH AND FATTENING

Live weight.	Appetite—as meal.	Maintenance ration—as meal.	Minimum requirement of digestible protein.	Production requirement per lb. live-weight increase—as meal.
lb.	lb.	lb.	lb.	lb.
50 . .	2½	1.5	.3	.7
100 . .	4½	2.9	.5	1.0
150 . .	5¾	3.3	.6	1.5
200 . .	7	3.6	.6	2.0
250 . .	7¾	3.8	.7	3.0
300 . .	8½	4.1	.7	3.5

See T. B. Wood, *Animal Nutrition* (1924); also *Rations for Live Stock and Report of Departmental Committee on Rationing of Dairy Cows*, published by the Ministry of Agriculture. (T. B. W.)

FEELING, PSYCHOLOGY OF. The word "feeling" is as one psychologist has remarked, a "psychological maid of all work." A thing "feels" hot, sharp, brittle or clammy, while we ourselves "feel" tired, hungry, happy or irritable. Even in psychology the term has been hard worked in many directions. But in the vast majority of modern writers it is used with special reference to one only of the three kinds of process into which mental life is now usually classified—that part which deals with "feeling" in the narrower sense, as distinct from "knowing" or "wishing." In this sense it is sometimes also called "affection" and is contrasted with "cognition" and "conation." What are the feelings in this sense? Are they unique mental processes or can they be analysed into simpler elements? This is a question which has played a prominent part in psychological discussion. On the whole, modern opinion inclines to the view that they are unique. The only forms of the opposite view which have any serious influence to-day are those which connect feeling in some way with sensation. Three theories of this kind deserve mention.

The James-Lange Theory.—(1). According to the first, feeling consists of various obscure and confused experiences, which upon attentive analysis reveal themselves as diffused sensations from various parts of the body. It is some such view as this that is implied in the famous James-Lange theory of the emotions—a theory which is held by few if any living psychologists, but which is treated with respect by very many. William James, whose brilliant championship is responsible for this respectful attitude, held the view explicitly only as regards the emotions, but C. G. Lange held it with reference to the feelings generally. For a full discussion, see JAMES-LANGE THEORY.

Pain.—(2). According to the second theory, the sensations in question are of a more specific kind; pleasant feelings can be analysed into a diffused sensation of tickling or a weak sensation of (sexual) “lust”; while unpleasantness is nothing else but a low intensity of pain. Now the strength of this theory obviously lies in its account of unpleasantness, and linguistic evidence certainly speaks strongly in its favour; for do we not speak of pain as occasioned both by the death of a dear friend and by a blow upon the shin? But there seems little doubt that language here is guilty of a confusion and that the two experiences are of quite a different order and do not merely differ in intensity. Physiological evidence indicates that pain has its special end organs in the skin and in the interior of the body, it has its special tract in the spinal cord, and there are probably portions of the body (such as the cornea and the dentine) from which no sensation other than pain can be elicited. And yet any sensation, any kind of experience whatsoever, can be disagreeable. Unpleasantness cannot therefore be identified with pain, and the strongest support of this theory falls to the ground.

The abandonment of this theory has, however, landed English speaking psychologists in a serious terminological difficulty. If it is incorrect to speak of unpleasant feeling as “pain,” what single substantive word can we employ to designate this kind of feeling as antithetical to “pleasure”? A recent coinage, which we shall here employ, is “unpleasure.”

Feeling as an Attribute.—(3). The third theory that connects feeling with sensation can be briefly disposed of. It regards feeling not as itself a sensation but as an attribute of sensation, in the same way that quality, intensity or duration are attributes. To this theory has been objected that feeling has itself these very attributes, and is not, like them, an ultimate phase of an elementary process. Furthermore it is said that feeling is different from the genuine attributes in that these latter are essential to the very existence of sensation (*e.g.*, a sensation without duration is no sensation), whereas there do exist “indifferent” sensations. Although this second argument is capable of being disputed (for it seems possible that delicate introspection might always reveal some degree of feeling), the combined effect of the two objections has proved so strong that the theory of feeling as an attribute of sensation is now seldom seriously advocated.

The discussion in the above paragraphs of the view that the feelings have some special relation to sensation has served to clear away certain important preliminary difficulties. Returning now to the more widely held view that feeling is a unique mental element, we may ask what further criteria of its uniqueness there are in addition to its unanalysability. Many supposed peculiarities of feeling have been noted but those which have withstood criticism with any degree of success may be reduced to four:—(i.) Feeling may be experienced in connection with any kind of mental process whatsoever; (ii.) Feelings have no images corresponding to the image in the sphere of sensation. A revived feeling is a fresh feeling, *e.g.*, comparable to a fresh perception of an object rather than to an image of that object “in the mind’s eye”; (iii.) Feelings do not stand in associative relation to one another. When they appear to do so, it is only in virtue of the accompanying perceptions and ideas, between which alone do genuinely associative links exist; (iv.) Feelings lack clearness in the sense that they tend to disappear if we attend to them. This has been much disputed but recent searching experiments by A. Wohlgemuth seem to show that this is strictly true. But a word of caution is needed. If we attend to a whole affective experience, we increase the feel-

ing; concentration on an aching tooth only makes the pain less tolerable, but if we succeed in attending to the *feeling* itself (as distinct from the other aspects of the total experience) we find that the feeling tends to vanish even as we grasp it.

Accepting provisionally the current view of feeling as an elementary process, how many kinds of feeling are there? The great majority of contemporary psychologists hold that there are only two—pleasure and unpleasure. Some others however have refused to admit that there are so few, and at first sight we might well be inclined to agree with them. Can the very varied and manifold feelings that we experience in toothache, in intense fatigue, in winning a game, in falling in love, or in leaping from a burning house, really be reduced to these two simple kinds? Most psychologists hold that they can, and that the seeming variety is due either to differences in the attributes of the feeling (*e.g.*, their intensity and duration), or to differences in the accompanying ideas, sensations or wishes, and not to differences in the quality of the feelings themselves. One theory of a contrary kind has however attained sufficient celebrity to necessitate a mention. This is the so-called tri-dimensional theory of Wilhelm Wundt, according to which there are not two but six kinds of feelings, arranged in three pairs of opposites as follows:—Pleasure—unpleasure, excitement—calm, tension—relaxation. Although early experiments brought some evidence in favour of this theory, later work has shown fairly conclusively that the two last named pairs are not elementary and unanalysable, as are the members of the first pair, but correspond rather to different strengths of conation and different intensities of muscular strain, and to combinations of these with pleasure and unpleasure.

According to the most generally accepted view then, pleasure and unpleasure are the only kinds of feeling; pleasures and unpleasures, moreover, do not differ qualitatively among themselves. Such apparent differences are entirely due to the varying cognitive and conative events that accompany them.

RELATION OF FEELING TO OTHER MENTAL PROCESSES

“Bound” and “Free” Feelings.—This brings us to the difficult subject of the relation between feeling on the one hand and cognition and conation on the other. As regards cognition, perhaps the most important fact to bear in mind is that there may exist all degrees of closeness in the relation between a feeling and the accompanying precepts or ideas. At the one extreme there are feelings which are intimately “bound” to a single definite sensation—so much that we tend to regard them as “objective” in the sense that they seem to belong more to the external object producing the sensation than to our inner “self”; as when we say “That deep blue sky is lovely,” or “That treacle tart is delicious.” At the other extreme are feelings which are relatively “free” in the sense that they do not seem to have a special relationship to any particular sensations or ideas; feelings which we regard as definitely “subjective” and belonging to the self. These latter feelings are relatively persistent and often form a background upon which the more fleeting parts of our experience come and go. When the persistence is strong, such feelings may be designated “moods.” But though a mood may have no specially intimate connection with any one idea or precept, it tends to colour everything so long as it lasts, so that the same ideas may seem pleasant or unpleasant according as we are in a happy or unhappy mood. Moods are thus very important factors in determining the relative amounts of pleasure and unpleasure in our life.

Let us start with a consideration of the field of the emotions. What are the “emotions” and how do they differ from feelings? Unfortunately there is as yet no generally accepted use of the term emotion among psychologists, but all modern writers seem agreed that emotions have, unlike feeling, a special relationship to some particular kind of conation. Pleasure and unpleasure may, as we have seen, be aroused in connection with any kind of experience. Emotions are only aroused under more specific circumstances, and each particular emotion stands in connection with a particular tendency to action; as is easily seen in the case of the more definite and pronounced emotions, such as fear and anger. William McDougall, to whom we owe perhaps more than to any

other author for clarification of thought on this subject, holds that there is a "primary" emotion corresponding to each of the chief instincts, the emotions corresponding in specificity to the specificity of the correlated instinct, that the relative emotion to some extent inevitably accompanies the operation of an instinct and that "secondary" emotions are formed by the blending of two or more primary emotions, when two or more instincts are simultaneously at work. A. F. Shand, chiefly owing to a narrower conception of instinct, holds that each emotion is correlated not with one but with several instincts, while James Drever and a considerable number of quite recent writers maintain that the term emotion is better reserved for the stronger affective states which result from the blocking of an instinctive tendency when it cannot be easily or quickly gratified. There is likewise no complete agreement as to what are the primary emotions, and the reader must be referred to the text-books for the various views on this subject.

Shand (and following him McDougall) is responsible for introducing the concept of another class of so-called "emotions"—"prospective" and "retrospective," "emotions of desire" or "derived emotions." These are complex states in which cognitive, conative and affective elements are all strongly marked. Those in the "prospective" group relate to desires whose fulfilment (or non-fulfilment) is anticipated in the future. In order of decreasing anticipation of fulfilment they are:—confidence, hope, anxiety, despondency, despair. The "retrospective" group is more difficult to classify, but it certainly includes regret, remorse and grief. McDougall correctly draws attention to the fact that these "emotions" are not emotions in the strict modern sense, inasmuch as they may be aroused in connection with *any* conative tendency whatsoever. It would be better in many ways to call them "feelings of desire."

Emotions, like feelings, tend to persist longer than the perceptions and ideas that arouse them, and thus they also may form moods, such as the timorous mood, the irritable mood, the tender mood, etc. Such a mood—"a resonating echo of the emotion"—is most easily brought about when the emotion (and its corresponding instinctive tendency) is denied free expression. It is in this way that conation as well as feeling contributes to the formation of moods.

In recent years our knowledge of the physiological basis of emotion has considerably widened—particularly as to the part played by the autonomic nervous system and by the ductless glands. The work of Walter B. Cannon and his coadjutors has shown for instance that the more violent emotions of fear and anger are specially associated with the central or "sympathetic" division of the autonomic nervous system, and that the action of this division tends generally to be antagonistic to the functions of the upper ("cranial") and lower ("sacral") divisions, the first of which is principally connected with nutrition and the more reposeful states, the second with the functions of excretion and reproduction. We thus see something of the neurological basis of certain psychological antagonisms such as those between fear and euphoria on the one hand and fear and sexual emotion on the other, which everyday life discloses and which have been emphasised in recent medicine. Furthermore the "sympathetic" division works in intimate relationship with the adrenal glands. The secretion of these glands produces physiological changes which are of use in flight, combat and other circumstances involving great exertion; it increases the amount of blood sugar and quickens the heart-beat (thus favouring muscular effort) and increases the coagulability of the blood (thus reducing loss of blood if wounded). It seems certain that other ductless glands such as the thyroid and the intestinal (puberty or sex) glands have also an important influence on our emotions (and therefore also on our moods), and probably there is a brilliant future for the study of our emotional life along the converging lines of psychology, neurology and chemistry.

"Hedonic" and "Hormic" Theories.—Granted the distinction we have made between (the more generally aroused) feelings and (the more specifically conative) emotions, we are still left with the general problem of how feeling is related to conation. It is almost universally recognised that somewhere in this rela-

tionship lies the key to the understanding of the true nature and function of feeling itself. It is round this relationship therefore that the chief theories of feeling have clustered. These theories are—as often happens in such a case—for the most part complementary rather than mutually exclusive. There is, however, one point at issue which is from the theoretic point of view rather fundamental; is conation determined by feeling or feeling by conation? Do we want things because they are pleasant (and try to avoid them because they are unpleasant), or are they pleasant because we want them (and unpleasant because we try to avoid them)? These two opposing views have been conveniently called by McDougall the "hedonic" and the "hormic" theories respectively. At first sight the hedonic theory that our desires are determined by our feelings may seem more in accordance with common sense; and indeed it has seemed to many of the earlier psychologists plainly evident that we are constantly endeavouring to secure pleasure and avoid unpleasure. But the great majority are now inclined to believe that the opposite view is the more correct. It is obvious that a great number of our feelings are directly conditioned by the success or failure of our conations both as regards the major and the minor ends of life. Careful study of many cases seems to show that this relation between pleasure and successful conation on the one hand and unpleasure and unsuccessful conation on the other hand is invariable, whereas the relation of feeling to the cognitive elements is variable; a perception or idea may be pleasant, indifferent or unpleasant, according to the conative tendencies operative at the moment (*e.g.*, the sight and smell of food may be very welcome if we are hungry, but most distasteful if we have just risen from an ample meal).

The chief difficulty of the "hormic" theory is concerned with the "objective" feelings accompanying sensation, and, as McDougall has recently shown, many psychologists who elsewhere hold this doctrine, wittingly or unwittingly fall back upon the "hedonic" view when dealing with feelings of this kind. And indeed, we may well be excused for thinking they are right, for the unpleasantness of a severe pain (to take the most striking case of all) seems at first sight to be inherently and inevitably connected with the pain itself and to have nothing to do with our conative attitude towards it. Some modern psychologists, however, have maintained that even the most intense pain can cease to be unpleasant if we can welcome and embrace it instead of trying to put an end to it.

The factors which obstruct conation in the attainment of its end and thus give rise to unpleasure, are, to use Stout's classification, of two main kinds—the material and the formal. The material consists in the nature of our perceptions or ideas themselves, the indication that they give that something in the external world prevents the satisfaction of our desires. If I want to enter a house but my visual and tactile perceptions tell me that the door is locked and that I have not got the key, or if I want to get to a certain town by to-morrow morning but my knowledge of the train service tells me that this is impossible—these are simple examples of material obstacles; here my cognitions frustrate my conations and are unpleasant. But if I remember that the key is under the scraper, or that by hiring a motor car I can get to the town by morning, the obstacles are removed and the corresponding ideas are pleasant.

"Pleasure" and "Reality" Principles.—It is to be noted that the ideas telling us that our desires can be fulfilled may be just as pleasant as the perceptions telling us they are being fulfilled; the thought of getting to town by motor car may be as gratifying as the actual perception of the town when I arrive there. Indeed so dependent is human affective life upon ideational, as distinct from perceptual conditions, that a very great proportion of our feelings are determined by anticipated or recollected, rather than perceived, good or evil. Our desires can be gratified not only in reality but in "imagination," and where there are serious external obstacles, gratification is more easily obtained through imagination than through perception. It is true, our most fundamental physiological needs cannot be permanently satisfied in this way, for

Who can . . .
 . . . Cloy the hungry edge of appetite
 By bare imagination of a feast?

Nevertheless in the case of many less urgent desires, the pleasures of imagination often make amends for the difficulties of reality—so much so that we are perhaps only too willing to accept them as a permanent substitute for “real” gratification. Of recent years psycho-analysis has thrown a vivid light upon the importance of this enjoyment without reference to reality. Sigmund Freud has indeed distinguished two principles in mental functioning, the “pleasure principle,” which takes no account of outer reality and in which gratification is obtained by simple imagination, and the “reality principle,” in which satisfaction of desire is sought in the real world at the cost of a temporary increase of displeasure.

The “formal” obstacles to the anticipated attainment of the ends of conation are due to the imperfect or inharmonious function of our own bodies or minds, as when we fail in some delicate adjustment through lack of manual dexterity, or fail to find the solution of a problem owing to confused thought. Here again psycho-analysis has greatly enriched our knowledge, by showing the importance of “conflict” in our mental life.

Many of our desires are incompatible, hence to gratify one is to frustrate another; and frustration necessarily occasions suffering. Mental conflict is indeed a very obvious cause of unpleasure and has been recognized as such in one form or another by many previous psychologists, notably by Herbart, though as a rule these earlier writers, in accordance with the general tendency of psychological thought in their time, laid more stress on cognitive and less on conative factors than is now done. One modern author (F. C. Bartlett) has gone so far as to consider that all unpleasure is due to conflict and not to simple frustration. The more general view, however, is that conflict only causes unpleasure indirectly through the frustration of conations, and that therefore, the more harmonious and integrated our personality, the greater our chances of happiness.

The “Super-Ego.”—One exceptionally important “formal” factor in connection with conflict is the influence exercised by the moral or quasi-moral standards associated with the idea of “self”—the “self-regarding sentiment” in McDougall’s terminology, the “super-ego” in Freud’s (though these two concepts are by no means entirely synonymous). There are certain standards of achievement and conduct which alone we consider worthy of ourselves (though not for the most part by conscious and deliberate formulation), and whenever we fall short of these standards and ideals there is frustration of the very powerful conative tendencies organized within this super-ego. If there is too wide a difference between the standard required by the super-ego and the kind of gratification which our instincts insistently demand, there may be a continuous struggle between the two sets of forces, with perpetual or alternate frustration on one side or the other. If the super-ego predominates, there is frustration of instinctive desire of such a kind as frequently gives rise to neurosis, with all the suffering that this entails; if the super-ego is overcome, it, as it were, seeks vengeance by causing the person to despise himself, self-contempt and self-reproach (and—as we may add—self-punishment) from this cause being one of the most potent causes of human misery. A more tolerant super-ego may in many ways permit of greater happiness, though a permanent and complete overthrow of the super-ego would be incompatible with social conduct and with the adaptation to social reality that civilization demands. The two extreme conditions can be studied in the complementary mental disorders of mania (where all inhibition, self-criticism and control seem to have been abandoned, and successive thoughts and impulses are left to jostle one another as best they can), and melancholia (where inhibition and self-criticism are so oppressive that there is little scope for anything but thoughts of self-reproach and self-abasement).

The “Tension” Theory.—Since, according to the “hormic” theory, feeling essentially depends upon conation, further light may be thrown upon feeling by a consideration of the ultimate nature of conation itself; in fact the theory of feeling is intimately linked with the theory of conation. During the last few years a considerable number of authors have (more or less independently) advocated what in effect may be regarded as a combined theory of feeling and conation. This may be briefly called the “tension”

theory. It holds that the ultimate aim of conation is to get rid of tension, whether caused by external or by internal stimulation, and that pleasure accompanies the diminution, unpleasure the increase of tension.

Biological and Physiological Theories.—Besides these psychological or psycho-physical theories of feeling, there are also theories of a more biological or physiological nature. The biological theories are all variants on the theme that pleasure occurs under conditions which are favourable to the organism, unpleasure under conditions which are unfavourable. There is pretty general agreement as to the fundamental correctness of this view, but it is also agreed that the correlation implied is far from being perfect. Some pleasant things are harmful and some harmless (or even beneficial) things are unpleasant. But, it is maintained, in the majority of such cases the harm or the benefit are not simultaneous with the feeling, but occur in the future; and feeling only indicates present conditions and is no prophet, or at best only becomes one after much experience—racial or individual.

Physiological theories are mostly based on the phenomena of fatigue, nutrition and dissimilation. Thus H. R. Marshall’s theory asserts that “Pleasure is produced by the use of surplus stored force in the organ determining the content, and pain is determined by the reception of a stimulus to which the organ is incapable of reacting completely. Indifference occurs when the action is exactly equalized to the stimulus.” According to the theory of Alfred Lehmann, pleasure occurs when $\frac{\text{Assimilation}}{\text{Dissimilation}} = 1$, the intensity of pleasure increasing with simultaneously increasing values of A and D, while unpleasure occurs when $\frac{A}{D} < 1$, increasing with the decrease of the value $\frac{A}{D}$. The difficulty of these theories is (here

once again) to account for the exciting pleasures and for the fact that pleasures may be tiring. In any case, however, all such theories are at present mere speculations lacking all detailed verification.

Since feeling can accompany any kind of mental process, it has often been argued that there is no cerebral centre for feeling; indeed, such a view is implied in the two above-mentioned physiological theories in their present form. But, as Wohlgemuth has pointed out, the position now most frequently adopted that feeling is an elementary mental process, combined with the further usual assumption that elementary mental processes have definitely corresponding brain centres, compels us to suppose that some such centre exists. Physiological and neurological evidence (particularly the clinical researches of Sir Henry Head and his co-workers) points rather strongly to the thalamus being such a centre; though in the past numerous other parts of the brain have been suggested (mostly on very insufficient evidence).

METHODS AND PROBLEMS

“Expression” and “Impression” Methods.—Experimental Psychology has devised various methods for the more accurate qualitative and quantitative investigation of the feelings and of their conditions and effects, and a good many of the already mentioned conclusions have been obtained by the use of such methods, though vast problems still await research. It has become customary to classify these methods into two main groups, the “expression” and “impression” methods respectively. In the expression method, feeling is studied through its physiological concomitants, muscular contractions, pulse, blood pressure, breathing, volume of a limb and electrical resistance being the physiological expressions that have been most frequently measured. Of these the observation of changes in electrical resistance (the psychogalvanic reflex) has on the whole shown itself most fruitful in results, though there is still much uncertainty as to the ultimate physiological and psychological interpretation of these results; in particular (on the psychological side) as to how far the changes in resistance are correlated with conative or affective experiences. The study of muscular contraction shows the sthenic and asthenic efforts of pleasure and unpleasure respectively, while it has also

CHART SHOWING THE SCHEME OF POSSIBLE PROCEDURE FROM A NEGATIVE TO A POSITIVE ATTITUDE IN THE GRATIFICATION OF DESIRE

shown that pleasure tends to produce an increase in voluntary extensor movement and a decrease in a voluntary flexor movement of a standard length, together with an increased liability to involuntary extensor movements and a decreased liability to involuntary flexor movements, unpleasure producing precisely opposite effects; an interesting result that is readily understandable if we remember that in joy a man tends to throw out his chest, extend his limbs and generally occupy more space than in the bent and huddled position that is characteristic of sorrow.

The impression method dispenses with physiological measurements and relies entirely upon introspective reports upon the feelings produced by experimental stimuli. With suitable precautions this method is proving itself surprisingly adequate to deal with many of the difficult problems in the psychology of feeling, and it looks as though we may expect great contributions from it in the near future. It has become very clear also that carefully controlled introspection is essential for the proper interpretation of the results obtained by the expression method.

"Is Life Worth Living?"—Quantitative methods have recently been applied to the age-old problem of the relative proportions of pleasure and unpleasure that are encountered in ordinary life.

J. C. Flügel's observers kept a minute record of their pleasant and unpleasant experiences according to a pre-arranged scale for a period of a month or more—making frequent entries in the course of each day. In every record pleasure predominated over unpleasure, the average percentage of the total time passed pleasantly, indifferently and unpleasantly, being 50, 28, 22, respectively; there were however considerable individual differences and there were also indications that those who frequently experienced the more intense feelings were on the whole rather more unhappy than those who seldom had intense feelings. As regards the actual nature and occasions of the mental states accompanied by feelings, the descriptions of the four conditions that rank highest as accompaniments of pleasure were (in order) "interest," "joy and elation," "contentment," "pleasant sensations"; the corresponding order for unpleasure being "unpleasant sensations," "anxiety and worry," "anger and annoyance," "fatigue."

Applied Hedonics.—In conclusion we may ask, Has psychology thrown any light on the equally ancient practical problem as to how happiness may best be attained? There is little to say definitely; and indeed psychologists have not as yet ventured systematically to attack the problem. We can at best only summarize a few scattered results of speculation and research.

Scientific psychology, to the small extent that it has dealt with such matters, has amply corroborated a few hoary commonplaces, such as that regarding the importance of bodily health (the "unpleasant sensations" that are the most potent causes of unhappiness in Flügel's results just quoted are largely due to minor ailments)

and that which asserts that "a pleasure shared is a pleasure intensified, while a pain shared is a pain relieved." It has however also revealed the great influence of mind over body (indigestion may be due to worry or irritation as well as vice versa) and (above all) the necessity of harmonious organization and co-operation of the various conative trends. A vast amount of unhappiness is caused by the conflict of disharmonious tendencies (particularly those connected with the function of the super-ego, as indicated above), and in the study of how harmonious development can be secured lies the chief promise of psychology for human happiness. For the rest, if the hornic theory is correct, all pleasure lies in the gratification of conation, all unpleasure in its frustration, so that there are at bottom only two methods available; either to increase the satisfaction of our desires, or to reduce these desires themselves. Starting from this foundation we may essay the following very provisional scheme of possible procedures in which scheme there is a continuous transition from a negative to a positive attitude as we move from left to right.

A is the method of putting from consciousness, of not thinking about, our desires (either by unconscious "repression" or conscious "suppression"). B is the method (shown most clearly in psychopathology) of attributing those desires to someone else. C is the classical method of pretending the things we desire are worthless, as by dwelling on the unpleasant aspect of these things or by laughing at ourselves for wanting them. D is the useful but sometimes unheroic principle of "take the cash and let the credit go." In the form of "sublimation," however, it plays an essential part in human development. In E the wish is father to the thought; here the "pleasure principle" reigns supreme, and the distinction between the wish and its fulfilment is abolished. In F the pleasure principle again reigns supreme, but in a strictly reserved territory. It is the method of day dreams and (to some extent) of art. In G the "fore-pleasure" takes the form of an imaginary satisfaction in anticipation of gratification in reality. Hence it is connected to H by a dotted line.

With this venturesome effort in classification, which (if it is worth anything) the reader should have no difficulty in filling out in detail, we must bid farewell to this precarious aspect of the subject. The true science of applied hedonics is not yet born.

FEHLING, HERMANN VON (1811–1885), German chemist, was born at Lübeck on June 9, 1811. He worked at Giesesen with Liebig, with whom he elucidated the composition of paraldehyde and metaldehyde. He was professor of chemistry at Stuttgart from 1839 until his death there on July 1, 1885. His earlier work included an investigation of succinic acid, and the preparation of phenyl cyanide (benzonitrile), the simplest nitrile of the aromatic series. Among the analytical methods discovered by him the best known is that for the estimation of sugars by "Fehling's solution," a solution of copper sulphate mixed with alkali and potassium-sodium tartrate (Rochelle salt).

FEHMARN, an island of the Prussian province of Schleswig-Holstein, in the Baltic, separated from the north-east corner of Holstein by the Fehmarn-Sund, less than a quarter of a mile broad. It is about 120 sq.m. in area, bare of forest but containing excellent pasture-land, and rears cattle. Burg, the chief town, has a population of 3,255.

FEHMIC COURTS, certain tribunals which, during the middle ages, exercised a powerful jurisdiction in Germany, and more especially in Westphalia. They are best regarded as survivals of ancient Teutonic local courts. Their alternative name of "free courts" is due to the fact that all free-born men were eligible for membership and also to the fact that they claimed certain exceptional liberties. Their jurisdiction they eventually owed to the emperor, in whose name they exercised the power of life and death. The sessions were often held in secret, and these the uninitiated were forbidden to attend, on pain of death. Legend and romance have combined to exaggerate the sinister reputation of the Fehmic courts; but modern historical research has proved that they never employed torture, that their sittings were only sometimes secret, and that their meeting-places were always well known. They were, in fact, a survival of an ancient and venerable German institution; and if, during a certain period, they exercised something like a reign of terror over a great part of Germany, the cause of this lay in the condition of the times, which called for some powerful organization to combat the growing feudal anarchy.

The system became important after the division of the duchy of Saxony on the fall of Henry the Lion, when the archbishop of Cologne, duke of Westphalia from 1180 onwards, placed himself as representative of the emperor at the head of the Fehme. The organization now rapidly spread. Every free man, born in lawful wedlock, and neither excommunicate nor outlaw, was eligible for membership. Princes and nobles were initiated; and in 1429 even the Emperor Sigismund himself became "a true and proper *Freischöffe* of the Holy Roman Empire." By the middle of the 14th century the sworn associates of the Fehme were scattered in thousands throughout Germany, known to each other by secret signs and pass-words, and all of them pledged to serve the summons of the secret courts and to execute their judgment.

The organization of the Fehme was elaborate. The head of each centre of jurisdiction (*Freistuhl*) often a secular or spiritual prince, sometimes a civic community, was known as the *Stuhlherr*, the archbishop of Cologne being, as stated above, supreme over all (*Oberststuhlherr*). The actual president of the court was the *Freigraf* (free count) chosen for life by the *Stuhlherr* from among the *Freischöffen*, who formed the great body of the initiated. Of these the lowest rank were the *Fronboten* or *Freifronen*, charged with the maintenance of order in the courts and the duty of carrying out the commands of the *Freigraf*. The immense development of the Fehme is explained by the privileges of the *Freischöffen*; for they were subject to no jurisdiction but that of the Westphalian courts, whether as accused or accuser they had access to the secret sessions, and they shared in the discussions of the general chapter as to the policy of the society. At their initiation these swore to support the Fehme with all their powers, to guard its secrets, and to bring before its tribunal anything within its competence that they might discover.

The procedure of the Fehmic courts was practically that of the ancient German courts generally. The place of session, known

as the *Freistuhl* (free seat), was usually a hillock, or some other well-known and accessible spot. The *Freigraf* and *Schöffen* occupied the bench, before which a table, with a sword and rope upon it, was placed. The court was held by day and, unless the session was declared secret, all freemen, whether initiated or not, were admitted. The accusation was in the old German form; but only a *Freischöffe* could act as accuser. If the offence came under the competence of the court, i.e., was punishable by death, a summons to the accused was issued under the seal of the *Freigraf*. This was not usually served on him personally, but was nailed to his door, or to some convenient place where he was certain to pass. Six weeks and three days' grace were allowed, according to the old Saxon law, and the summons was thrice repeated. If the accused appeared, the accuser stated the case, and the investigation proceeded by the examination of witnesses as in an ordinary court of law. The judgment was put into execution on the spot if that was possible. The secret court, from whose procedure the whole institution has acquired its evil reputation, was closed to all but the initiated, although these were so numerous as to secure quasi-publicity; and the members present were bound under pain of death not to disclose what took place. Crimes of a serious nature, and especially those that were deemed unfit for ordinary judicial investigation—such as heresy and witchcraft—fell within its jurisdiction, as also did appeals by persons condemned in the open courts, and likewise the cases before those tribunals in which the accused had not appeared. The accused if a member could clear himself by his own oath unless he had revealed the secrets of the Fehme. If he were one of the uninitiated it was necessary for him to bring forward witnesses to his innocence from among the initiated, whose number varied according to the number on the side of the accuser, but 21 in favour of innocence necessarily secured an acquittal. The only punishment which the secret court could inflict was death. If the accused appeared, the sentence was carried into execution at once; if he did not appear, it was quickly made known to the whole body, and the *Freischöffe* who was the first to meet the condemned was bound to put him to death. A knife with the cabalistic letters was left beside the corpse to show that the deed was not a murder.

That an organization of this character should have outlived its usefulness and issued in intolerable abuses was inevitable. With the growing power of the territorial sovereigns and the gradual improvement of the ordinary process of justice, the functions of the Fehmic courts were superseded, though they were only finally abolished by order of Jerome Bonaparte, king of Westphalia, in 1811. The last *Freigraf* died in 1835.

Heine, *die Beziehungen der Stadt Zerbst, Zu den westfälischen Verngerichten*, Halle (1912); P. Heck, "Eine neue Theorie der sächsischen Freidinge," *Historischer Verein für niedersachsen Zeitschrift* Jahrg. 80, pp. 396–418, Hanover (1915).

FEHRBELLIN, a town of Germany, in the republic of Prussia, on the Rhine, 40 m. N.W. from Berlin on the railway to Neu-Ruppin. Pop. (1925) 1,763. It has some small industries, among them that of wooden shoes. Fehrbellin is memorable in history as the scene of the victory (June 18, 1675) of the great elector, Frederick William of Prussia, over the Swedes under Field-Marshal Wrangel.

FEHRENBACH, KONSTANTIN (1852–1926) German statesman, chancellor of the Reich, was born at Wellendingen on Jan. 11, 1852, the son of an elementary schoolmaster. He was a member of the Baden second chamber (1885–87 and 1901–13), and acted from 1907–1909 as its president. He entered the Reichstag in 1903, was its president in 1918, and presided over the national assembly 1919–20. As soon as the results of the German general election (June 1920) became known the Müller cabinet

resigned, and Fehrenbach became Chancellor with Dr. Simons as his foreign secretary. Fehrenbach himself was a member of the centre party with leanings towards the left, and was on good terms with the social democrats, on whose forbearance his government, which was in a minority in the Reichstag, depended. He conducted negotiations with the Allies at the Spa and London Conferences, 1920-21, and retired on May 4, 1921 in consequence of the failure of the London Conference of March and the consequent ultimatum by the Allies. As chairman of the Reichstag group of the centre party from 1924 he exercised considerable influence on politics until his death at Freiburg-im-Breisgau on March 26, 1926.

FEIJOA, a small tree (*Feijoa Sellowiana*) of the myrtle family (Myrtaceae), closely related to the guava (*g.v.*) and often called pineapple guava. It is a native of southern Brazil, Paraguay, Uruguay and parts of Argentina, and is cultivated in various mild climates for its highly esteemed fruit. The tree grows about 15 ft. high and has olive-like leaves, dark green above and silvery-grey beneath, and large white flowers which are purplish-crimson within. The oblong fruit, about 2 in. long and dull green in colour marked with crimson, has a translucent, melting pulp, with a delicious pineapple flavour. When mature the fruits fall, but must be kept in a cool place until sufficiently soft for eating. They are made into jam and jelly and are also crystallized. The feijoa was introduced into southern Europe in 1890 and about 10 years later was brought to California where it is extensively cultivated. The tree requires a dry climate, such as that of southern France and parts of California; it does not thrive in the moist climate of Florida and Cuba. It is usually propagated by seeds, which come fairly true to type, but cuttings may be rooted under glass and whip-grafting effected by using seedlings with stems of the thickness of an ordinary lead-pencil. Choice varieties are also perpetuated by the layering of low branches.

FEIJÓO Y MONTENEGRO, BENITO JERONIMO (1676-1764), Spanish monk and scholar, whose *Teatro critico* (1726-39) and *Cartas eruditas* (1742-60) uprooted many popular errors, awakened an interest in scientific methods, and caused Feijóo to be justly regarded as the initiator of educational reform in Spain.

FEIS CEOIL (fāsh kyōl'), Irish musical festival, founded in 1897 and one of the best-established and most useful institutions in Irish musical life. The study and cultivation of Irish music are especially aimed at, but not now, as at first, exclusively, the ultra-particularist policy originally adopted in this respect having been wisely abandoned. The festival, which lasts a week, is held annually in Dublin in May, more or less on the lines of the English Competition Festivals. Similar competitions are also held at Londonderry and Sligo.

FEISUL AL HUSAIN (fī-zōōl'ahl-hōō-sīn) (1885-), king of 'Irāq, was born at Taif, third son of Sharif Husain. Feisul descends from Fatimah, only surviving child of the Prophet, through Hasan, her eldest son by marriage with 'Ali Ibn Abi Talib, fourth Amir Al Muninin. After the custom of his house, Feisul was sent when only seven days old, to Rahab Palace, the country seat of the Al 'Aun family, in the territory of his clan, Beni 'Abadiyah and their confederates the 'Ataibah. Here the boy was raised among the tribesmen, and remained until he was seven. In 1893, when Husain was ordered to Constantinople, Feisul accompanied him and was educated privately in that city. In 1905 he married his cousin, and returned to the Hejāz in 1909, when his father was appointed Sharif.

In 1913 Feisul became deputy for Jiddah and proceeded to identify himself with the Arab National movement. He commanded his father's forces in 'Asir in 1914, and was at Mecca on the outbreak of the World War. He was posted with the Turkish Governor of Syria in 1915, but escaped to the Hejāz early in the following year, and there played a leading part in the Arab revolt, commanding the Arab forces with Gen. Allenby's army until the capture of Aleppo in Oct. 1918. His influence with the tribes did much to keep Husain's tribal levies in the field. As Commander-in-Chief of the Arab Army under the Allied Commander-in-Chief he then undertook the administration of the newly-constituted

Syrian State, and after attending the Peace Conference in Paris returned to Syria in April 1919. In Sept. he again visited Europe and remained until Feb. 1920; in the following month he was proclaimed King of Syria, but being unable to come to terms with the French Mandatory power he left Damascus in July 1920. After spending the winter in England he proceeded to 'Irāq as candidate for the throne in June 1921, and was elected king by a plebiscite in which he received 96% of the votes cast. For the events of his reign see 'IRĀQ.

FEITH, RHIJNVIS (1753-1824), Dutch poet, was born of an aristocratic family at Zwolle, the capital of the province Overijssel, on Feb. 7, 1753. He was educated at Harderwijk and at the University of Leyden, where he took his degree in 1770. In 1780, in his 27th year, he became burgomaster of Zwolle. His first important production was *Julia*, in 1783, a novel written in emulation of *Werther*, and steeped in *Weltschmerz* and despair. This was followed by the tragedy of *Thirsa* (1784); *Ferdinand and Constantia* (1785), another *Werther* novel; and *The Patriots* (1784), a tragedy. Bilderdijk and other writers attacked his morbid melancholy, and Johannes Kinker (1764-1845) parodied his novels, but his vogue continued. In 1791 he published a tragedy of *Lady Jane Grey*; in 1792 a didactic poem, *The Grave*, in four cantos; in 1793 *Inez de Castro*; in 1796 to 1814 five volumes of *Odes and Miscellaneous Poems*; and in 1802 *Old Age*, in six cantos. He died at Zwolle on Feb. 8, 1824.

His works were collected (Rotterdam, 11 vols.) in 1824, with a biographical notice by N. G. van Kampen.

FEJER, GYORGY (1766-1852), Hungarian author, was born on April 23, 1766, at Keszthely (Zala). He studied philosophy at Budapest and theology at Pressburg, obtaining in 1808 a professorship of theology at Budapest university, where in 1824 he was appointed librarian. His most important work, *Codex diplomaticus Hungariae ecclesiasticus ac civilis* (1829-44), exceeds 40 volumes; it consists of old documents and charters from A.D. 104 to 1439. His last works were *A Kunok eredete* (*The Origin of the Huns*) and *A politikai forradalmak okai* (*The Causes of Political Revolutions*), both published in 1850, the latter being suppressed by the Austrian Government on account of its liberal tendencies.

See *Magyar Irók: Eletrajz-gyűjtemény* (Budapest, 1856), and *A magyar nemzeti irodalomtörténet vázlatja* (Budapest, 1861).

FEJERVARY, GEZA, FREIHERR VON (1833-1914), Hungarian statesman, and general, was born on March 15, 1833. He began his career in the army, and was decorated for gallantry at Solferino. In 1872 he became State Secretary in the Hungarian ministry of national defence (*Honved*) and minister of national defence in 1884. In 1895 he persuaded the Emperor Francis Joseph to agree to the religious and political reforms of the Wekerle Ministry. In 1903 he resigned, together with the prime minister Szell, owing to the rejection of a bill to increase the contingent of recruits, and was appointed captain of the Hungarian Life Guards organized at that time. He was appointed premier on June 18, 1905. The parliamentary majority declared that the Fejervary ministry was unconstitutional, and organised a national opposition against it. Fejervary nevertheless succeeded in settling these differences by the so-called Pactum, on the basis of which the Wekerle Ministry was formed on April 8, 1906. From this time onwards Fejervary's political activity ceased, and he resumed his military career. On the death of Prince Esterhazy, captain of the Hungarian bodyguard, Fejervary was appointed his successor. He died of cancer of the tongue on April 25, 1914.

FELANITX or **FELANICHE**, a town in the island of Majorca, Balearic islands; 7 m. inland from its harbour, Puerto Colon, and terminus of a railway from Palma, the capital. Pop. (1920), 11,353. Felanitx is separated from the Mediterranean by low hills, on one of which stands the monastery of San Salvador, and a little south is the Moorish castle of Santueri, with its remarkable subterranean vaults. The town has a pottery industry dating from the 3rd century B.C. and trades in local wine, almonds, fruit, timber, oil and soap.

FELDKIRCH, a small town in the province of Vorarlberg, Austria. Situated on the river Ill, a few miles above its confluence

with the Rhine, it is a frontier and customs station of great importance as it commands the route to the east over the Arlberg pass (5,912 ft.), and has been the scene of many conflicts for the pass. The town is dominated by the old castle of Schattensburg and has a number of old buildings, notably the 15th century parish church, in striking contrast to its modern textile factories where the spinning, weaving and dyeing of cotton is carried on. There is a flourishing transit trade both along the east-west route and northwards to Lake Constance. Pop. (1923) 4,900.

FÉLIBIEN, ANDRÉ (1619-1695), sieur des Avaux et de Javerzy, French architect and historiographer, was born at Chartres. He was one of the first members (1663) of the Academy of Inscriptions, historiographer to the king, was secretary to the newly founded Academy of Architecture, and keeper of the cabinet of antiques in the palace of Brion. To these offices was afterwards added by Louvois that of deputy controller-general of roads and bridges. Of his works the best and the most generally known is the *Entretiens sur les vies et sur les ouvrages des plus excellents peintres anciens et modernes*. It was republished with several (5 parts; 1666-88; enlarged ed. Amsterdam, 1706, and Trévoux, 1725). Félibien wrote also *Origine de la peinture* (1660), *Principes de l'architecture, de la sculpture, de la peinture*, etc. (1676-90), and descriptions of Versailles, of La Trappe, and of the pictures and statues of the royal residences. He died in Paris on June 11, 1695.

His son, Jean François Félibien (c. 1658-1733), was also an architect who left a number of works on his subject; and a younger son, Michel Félibien (c. 1666-1719), was a Benedictine of Saint Germain-des-Prés whose fame rests on his *Histoire de l'abbaye royale de S. Denys en France*, and his *L'Histoire de la ville de Paris* in 5 vols., a work indispensable to the student of Paris.

FELIX, SAINT, of Valois (1127-1122), one of the founders of the order of Trinitarians or Redemptionists, was born in the district of Valois, France, on April 19, 1127. He became a hermit in the forest of Galeresse, where he remained until 1187, when his disciple Jean de Matha (1160-1213) suggested to him the idea of establishing an order of monks who should devote their lives to the redemption of Christian captives from the Saracens. Obtaining the sanction of the pope about 1197, they founded the mother house at Cerfroi in Picardy. Felix died at Cerfroi on Nov. 4, 1212, and is commemorated on Nov. 20.

FELIX, the name of five popes.

FELIX I., pope from Jan. 269 until his death in Jan. 274. His name is given as a martyr in the Roman calendar and elsewhere, but his title to this honour is by no means proved. He appears in connection with the dispute in the church of Antioch between Paul of Samosata, who had been deprived of his bishopric by a council of bishops for heresy, and his successor Domnus. Paul refused to give way, and in 272 the emperor Aurelian was asked to intervene. He ordered the church building to be given to the bishop who was "recognized by the bishops of Italy and of the city of Rome" (Felix). See Eusebius, *Hist. Acc.* vii. 30. *Liber Pontificalis* t.1, ed. Duchesne (1886).

FELIX II., antipope, was in 356 raised from the archdeaconate of Rome to the papal chair, when Liberius was banished by the emperor Constantius for refusing to condemn Athanasius. In 357 Constantius agreed to the release of Liberius on condition that he signed the semi-Arian creed. Constantius also issued an edict to the effect that the two bishops should rule conjointly, but Liberius was received with so much enthusiasm that Felix found it necessary to retire. He appears to have retired to Porto where he died in 365. See *Liber Pontificalis* t.1.

FELIX III. became pope in March 483. His first act was to repudiate the Henoticon, a deed of union, originating, it is supposed, with Acacius, patriarch of Constantinople, and published by the emperor Zeno with the view of reconciling the Monophysites and their opponents in the Eastern church. He also addressed a letter of remonstrance to Acacius; but the latter proved refractory, and sentence of deposition was passed against him. As Acacius, however, had the support of the emperor, a schism arose between the Eastern and Western churches, which lasted for 34 years. Felix

died in 492. See *Liber Pontificalis* t.1. His writings are in Migne's *Patrol. Lat.* t. 58.

FELIX IV. was raised to the papal chair in 526 by the emperor Theodoric. The serious riots over his election led him, on his death-bed, to nominate as his successor, the archdeacon Boniface (Pope Boniface II.). But this proceeding was contrary to all tradition and roused much opposition. Felix built the church of SS. Cosimo and Damiano, near the Via Sacra. He died in Sept. 530. See Letters in Migne: *Patrol. Lat.* t. 65 and *Liber Pontificalis* t. 1.

FELIX V., the name taken by Amadeus (1383-1451), duke of Savoy, when elected pope in 1439. Amadeus was born at Chambéry on Dec. 4, 1383, and succeeded his father as count of Savoy in 1391. In 1416 the German king Sigismund erected Savoy into a duchy; after this elevation Amadeus added Piedmont to his dominions. Then suddenly, in 1434, the duke retired to a hermitage at Ripaille, near Thonon, resigning his duchy to his son Louis (d. 1465). In 1439, when Eugenius IV. was deposed by the Schismatic council of Basel, Amadeus, although not in orders, was chosen as his successor. In the conflict between the rival popes which followed, the German king, Frederick IV., sided with Eugenius, and Felix renounced his claim to the pontificate in 1449 in favour of Nicholas V., who had been elected on the death of Eugenius. Nicholas appointed Amadeus apostolic vicar-general in Savoy, Piedmont and other parts of his own dominions, and made him a cardinal. Amadeus died at Geneva on Jan. 7, 1451.

FELIX, a missionary bishop from Burgundy, sent into East Anglia by Honorius of Canterbury (630-31). Under King Sigebert his mission was successful, and he became first bishop of East Anglia, with a see at Dunwich, where he died and was buried, 647-8.

BIBLIOGRAPHY.—See Bede, *Hist. Eccl.*, edit. C. Plummer, ii. 15, iii. 18, 20, 25 (1896); *Saxon Chronicle*, edit. J. Earle and C. Plummer, s.a. 636 (1865). See also under March 8th in J. Bollandus and G. Henschenius, *Acta Sanctorum Bollandiana* (Paris, 1863 etc.).

FELIX, of Urgella (*fl.* 8th century), Spanish bishop, the friend of Elipandus and the propagator of his views in the great Adoptionist Controversy (see ADOPTIANISM).

FELIX, ANTONIUS, procurator of Judaea A.D. 51 or 52 to 60, was a Greek freedman. On entering his province he married Drusilla, sister of Agrippa II. (Acts. xxiv. 24), having induced her to leave her husband Azizus, king of Emesa. Tacitus' description of Felix is not unjust: "he revelled in cruelty and lust, and wielded the power of a king with the mind of a slave." His rule was marked by disturbances and assassinations. Yet his long term of service in Palestine had enabled him to learn something of native customs and law, *cf.* St. Paul's words in Acts xxiv. 10; Felix had been prefect of Samaria before his appointment to the procuratorship.

BIBLIOGRAPHY.—See Josephus, *Ant.* XVIII., vi. 6; XX., vi. 1-3, viii. 6-9; *Jewish War* II. xii. 3 ff., xii. 5, 7; Tacitus, *Annals*, XII. 54, *Hist.* V. 9; Suetonius, *Claudius* 28; Schürer, *The Jewish People in the Time of Jesus Christ*; I. ii., pp. 174 ff.; Ramsay, *St. Paul the Traveller*; Commentaries on Acts.

FELIXSTOWE, a seaside resort in the Woodbridge parliamentary division of East Suffolk, England, 84½ m. N.E. by E. from London on a branch of the L.N.E.R. from Ipswich. Pop. of urban district (1931) 12,037 (which figure is augmented by summer visitors). Felixstowe has a frontage both to the North sea and to the estuary of the Orwell opposite Harwich, with which it is connected by L.N.E.R. ferry and where there is a small dock for yachts and river shipping. The church of St. Peter and St. Paul, mainly Early English, has traces of Norman in the 12th century nave. The sea-wall and promenade, 2 m. long, are laid out with public gardens and pavilions, and there is a promenade pier. Felixstowe has good golf links, and the open tournament of the East of England lawn tennis championship is held here annually. It is the headquarters of the Orwell Corinthian Yacht club, and has connections by steamer with Ipswich (as well as with London, Yarmouth and other coastal resorts in the summer). There is a naval shore wireless station and an R.A.F. seaplane station at Felixstowe. Phosphate of lime is dug in the neighbourhood and exported for use as manure. The neighbouring village

of Walton is a short distance inland. The vicinity has yielded numerous Roman remains, and there was a Roman fort in the neighbourhood (now destroyed by the sea), forming part of the coast defence of the Litus Saxonicum in the 4th century.

FELL, JOHN (1625-1686), English divine, son of Samuel Fell, dean of Christ Church, Oxford, was born at Longworth, Berkshire. In 1636 he obtained a studentship at Christ Church, and took holy orders (deacon 1647, priest 1649). During the Civil War he bore arms for the king and held a commission as ensign. In 1648 he was deprived of his studentship by the parliamentary visitors, and during the next few years he resided chiefly at Oxford with his brother-in-law, Dr. T. Willis, at whose house opposite Merton College he and his friends Allestree and Dolben kept up the service of the Church of England through the Commonwealth.

At the Restoration Fell was made prebendary of Chichester, canon of Christ Church (July 27, 1660), dean (Nov. 30), master of St. Oswald's hospital, Worcester, chaplain to the king, and D.D. He filled the office of vice-chancellor from 1666 to 1669, and was consecrated bishop of Oxford in 1676, retaining his deanery *in commendam*. Some years later he declined the primacy of Ireland. Fell restored in the university the good order instituted by Archbishop Laud, which in the Commonwealth had given place to anarchy and a general disregard of authority. He obliged the students to attend lectures, instituted reforms in the performances of the public exercises in the schools, kept the examiners up to their duties, and himself attended the examinations. He encouraged the students to act plays. He entirely suppressed "*coursing*," i.e., disputations in which the rival parties "ran down opponents in arguments," and which commonly ended in blows and disturbances. Tom Browne, author of the *Dialogues of the Dead*, about to be expelled from Oxford for some offence, was pardoned by Fell on the condition of his translating extempore the 33rd epigram from Martial:—

Non amo te, Sabidi, nec possum dicere quare;
Hoc tantum possum dicere, non amo te.

To which he immediately replied with the well-known lines:—

I do not love thee, Doctor Fell,
The reason why I cannot tell;
But this alone I know full well,
I do not love thee, Doctor Fell.¹

Fell's building operations were numerous. In his own college he completed in 1665 the north side of Wolsey's great quadrangle, already begun by his father but abandoned during the Commonwealth; he rebuilt in 1672 the east side of the Chaplain's quadrangle "with a straight passage under it leading from the cloister into the field," occupied now by the new Meadow Buildings; the lodgings of the canon of the 3rd stall in the passage uniting the Tom and Peckwater quadrangles (c. 1674); a long building joining the Chaplain's quadrangle on the east side in 1677-1678; and lastly the great tower gate, begun in June 1681 on the foundation laid by Wolsey and finished in November 1682, to which the bell "great Tom," after being recast, was transferred from the cathedral in 1683. In 1670 he planted and laid out the Broad Walk. He spent large sums of his own on these works, gave £500 for the restoration of Banbury church, erected a church at St. Oswald's, Worcester, and the parsonage house at Woodstock at his own expense, and rebuilt Cuddesdon palace. Fell disapproved of the use of St. Mary's church for secular purposes, and promoted the building of the Sheldonian theatre by Archbishop Sheldon. He was treasurer during its construction, presided at the formal opening on July 9, 1669, and was nominated with Wren curator in July 1670. In the theatre was placed the University Press, which now engaged a large share of Fell's energy and attention, and which as curator he practically controlled. He published annually one work, generally a classical author annotated by himself, which he distributed to all the students of his college on New Year's day. On one occasion he surprised the Press in printing surreptitiously Aretino's *Postures*, when he seized and destroyed the plates and impressions. In 1675 he published the Elzevir text

¹J. T. Browne, *Works* (9th ed. by J. Drake), iv. 99-100; T. Forde, *Virtus rediviva* (1661), 106.

of the Bible, and also gave assistance to John Mill in his critical edition of the New Testament (1707).

Fell himself bore a high reputation as a Grecian, a Latinist and a philologist, and he found time, in spite of his great public employments, to bring out with the collaboration of others his great edition of St. Cyprian in 1682, an English translation of *The Unity of the Church* in 1681, editions of *Nemesius of Emesa* (1671), of *Aratus* and of *Eratosthenes* (1672), *Theocritus* (1676), *Alcynous on Plato* (1677), *St. Clement's Epistles to the Corinthians* (1677), *Athenagoras* (1682), *Clemens Alexandrinus* (1683), *St. Theophilus of Antioch* (1684), *Grammatica rationis sive institutiones logicae* (1673 and 1685), and a critical edition of the New Testament in 1675. The first volumes of *Rerum Anglicarum scriptores* and of *Historiae Britannicae*, etc., were compiled under his patronage in 1684. He had the mss. of St. Augustine in the Bodleian and other libraries at Oxford generously collated for the use of the Benedictines at Paris, then preparing a new edition of the father.

In Nov. 1684, at the command of the king, Fell deprived Locke (*q.v.*), who had incurred the royal displeasure by his friendship with Shaftesbury, and was suspected as the author of certain seditious pamphlets, of his studentship at Christ Church, summarily and without hearing his defence. Fell afterwards expressed his regret for the step which he was now compelled to take.

Fell, who had never married, died on July 10, 1686, and was buried in the divinity chapel in the cathedral.

Fell probably had some share in the composition of *The Whole Duty of Man*, and in the subsequent works published under the name of the author of *The Whole Duty*, which included *Reasons of the Decay of Christian Piety*, *The Ladies' Calling*, *The Gentleman's Calling*, *The Government of the Tongue*, *The Art of Contentment* and *The Lively Oracles given us*, all of which were published in one volume with notes and a preface by Fell in 1684.

F(ell)* (1695); *Notes and Queries*, ser. vi. 2, and ser. vii. 166; *Calendars of State Papers, Dom. Series* (1660-1675). Fell's books and papers were bequeathed by his nephew Henry Jones to the Bodleian library. A few of his letters are to be found in *Add. MSS. Brit. Mus.* 11046, and some are printed in *Life of James II.*, by Ch. J. Fox, *Appendix; Gent. Mag.* 77, p. 633; *Academy*, 8, p. 141; *Athenaeum* for 1887 (2), p. 311; J. Gutch, *Collectanea Curiosa*, i. 269; and in *Cal. of State Papers, Dom. Series. Specimens of Books printed at Oxford, with types given to the University by John Fell*, Oxford Univ. press (1925).

FELL, a term with three meanings: (1) adj., savage, ruthless, terrible; (2) n., a hill, appearing in place-names and names of hills, e.g., Scawfell; also a lofty moorland down; (3) verb, to cause to fall, as to fell a tree. Fell is also used as a synonym for the felt or hide of an animal, and has special technical uses in connection with mining and weaving.

FELLAH (pl. Fellahin), Arabic for "ploughman" or "tiller," the word used in Arabic-speaking countries to designate peasantry. It is employed especially of the peasantry of Egypt, as opposed to the Arabs of the desert (and even those who have settled on the land), the Turks and the townfolk. Fellah is used by the Arabs as a term of reproach, implying a slavish disposition; the fellahin, however, are not ashamed of the name and may pride themselves on being of good fellah descent, as a "fellah of a fellah." They preserve to some extent the blood of the ancient Egyptians. They form the bulk of the population of Egypt and are mainly Mohammedan, though some villages in Upper Egypt are to-day almost exclusively Copt (Christian). Fellahin in the Delta are sometimes lighter than Arabs, while in Upper Egypt the prevailing complexion is dark brown. The average fellah is somewhat above medium height, big-boned, of clumsy but powerful build, with head and face of fine oval shape, cheek-bones high, forehead broad, short flattish nose with wide nostrils and black but not woolly hair. The eyebrows are always straight and smooth,

never bushy. The mouth is thick-lipped and large but well formed. The eyes are large and black, and are remarkable for the closeness of the eyelashes. The women and girls are particularly noted for their graceful and slender figures. The men's heads are usually shaved. The women are not as a rule closely veiled: they generally paint the lips a deep blue, and tattoo a floral device on the chin, sometimes on the forehead and other parts of the body. All but the poorest wear necklaces of cheap pearls, coins or gilt disks. The men wear a blue or brown cotton shirt, linen drawers and a plain skull-cap, or on occasion the tarbush or fez, round which sometimes a turban is wound; the women wear a single cotton smock. The common fellah's home is a mere mud hut, roofed with durra straw. Inside are a few mats, a sheepskin, baskets and some earthenware and wooden vessels. He lives almost entirely on vegetables, millet bread, beans, lentils, dates and onions. Most of the sheikhs are wealthy, and have large houses built of crude brick and whitewashed with lime, with a courtyard, many apartments and good furniture. The fellah is laborious and loathes military service; hence voluntary mutilations to avoid conscription were formerly common.

FELLENBERG, PHILIPP EMANUEL VON (1771-1844), Swiss educationist, was born on June 27, 1771 at Bern, in Switzerland. He purchased in 1799 the estate of Hofwyl, near Bern, intending to make agriculture the basis of a new system which he had projected, for elevating the lower and rightly training the higher orders of the State, and welding them together in a closer union than had hitherto been deemed attainable. For some time he carried on his labours in conjunction with Pestalozzi, but incompatibility of disposition soon induced them to separate. Fellenberg's scheme at first excited a large amount of ridicule, but gradually pupils came to him from every country in Europe, both for the purpose of studying agriculture and to profit by the high moral training which he associated with his educational system. Fellenberg died on Nov. 21, 1844.

See W. von Hamm, *E. Fellenberg's Leben und Wirken* (Bern, 1845); and F. R. Schoeni, *Der Stifter von Hofwyl, Leben und Wirken Fellenberg's* (Schaffhausen, 1874).

FELLING, an urban district in the Jarrow parliamentary division of Durham, England, forming a south-eastern suburb of Gateshead with railway station on the L.N.E. railway. Pop. (1931) 27,041. Christ Church was built in 1866. The large industrial population is employed in the neighbouring collieries and the various attendant manufactures. The council owns the water and gas supplies, together with electric trams, recreation grounds and other municipal enterprises.

FELLOE, the outer rim of a wheel, to which the spokes are attached. The word is sometimes spelled and usually pronounced "felly." It is a Teutonic word, in O.E. *felg*, cognate with Dutch *velge*, Ger. *Felge*; the original Teutonic root from which these are derived probably meant "to fit together."

FELLOW, by origin a partner or associate, hence a companion, comrade or mate. The word from the 15th century has also been applied to any male person, often in a contemptuous or pitying sense. The O.E. *féolage* meant a partner in a business. The word was, therefore, the natural equivalent for *socius*, a member of the foundation of an incorporated college, as Eton, or a college at a university. In the earlier history of universities, both the senior and junior members of a college were known as "scholars," but later, as now, "scholar" was restricted to those members of the foundation still in *statu pupillari*, and "fellow" to those senior graduate members who have been elected to the foundation by the corporate body, sharing in the government and receiving a fixed emolument out of the revenues of the college, as at Oxford and Cambridge and Trinity, Dublin. At other universities the term is applied to the members of the governing body or to the holders of certain sums of money for a fixed number of years to be devoted to special study or research. By analogy the word is also used of the members of various learned societies and institutions.

FELLOWS, SIR CHARLES (1799-1860), British archaeologist, was born at Nottingham, where his family had an estate. In 1827 he discovered the modern ascent of Mont Blanc. He travelled in Italy, Greece and the Levant, and many of his sketches

were used in illustrating *Childe Harold*. In 1838 he went to Asia Minor, making Smyrna his headquarters. He entered Lycia and explored the Xanthus from the mouth at Patara upwards. Nine miles from Patara he discovered the ruins of Xanthus, the ancient capital of Lycia, and about 15m. farther the ruins of Tlos. He published his results in *A Journal written during an Excursion in Asia Minor* (1839) and late in 1839, under the auspices of the British Museum, again set out for Lycia, accompanied by George Scharf, who assisted him in sketching. This second visit resulted in the discovery of 13 ancient cities, and in 1841 appeared *An Account of Discoveries in Lycia, being a Journal kept during a Second Excursion in Asia Minor*. A third visit was made late in 1841, after Fellows had obtained a *firman* by personal application at Constantinople. He shipped a number of works of art for England, and in the fourth and most famous expedition (1844) 27 cases of marbles were despatched to the British Museum. His chief discoveries were at Xanthus, Pinara, Patara, Tlos, Myra and Olympus. In 1845 he was knighted, and died in London on Nov. 8, 1860.

In addition to the works above mentioned, Fellows published the following: *The Xanthian Marbles; their Acquisition and Transmission to England* (1843), a refutation of false statements that had been published; *An Account of the Ionic Trophy Monument excavated at Xanthus* (1848); a cheap edition of his two *Journals*, entitled *Travels and Researches in Asia Minor, particularly in the Province of Lycia* (1852); and *Coins of Ancient Lycia before the Reign of Alexander; with an Essay on the Relative Dates of the Lycian Monuments in the British Museum* (1855).

See C. Brown, *Lives of Nottinghamshire Worthies* (1882), pp. 352-353, and *Journ. of Roy. Geog. Soc.*, 1861.

FELO DE SE, one who murders himself, i.e., a suicide. The technical conditions of murder with one exception apply to this crime. Thus, although an attempt to commit suicide is a misdemeanor at English common law, aiding or inciting to suicide is the felony of murder. So also is the so-called suicide pact. Formerly a suicide was buried on the highway, with a stake driven through the body. This was abolished by an act of 1823, which ordered the burial of the body of a person found to be *felo de se* within 24 hours after the coroner's inquest, between the hours of 9 and 12 at night, and without Christian rites of sepulture. This act was again superseded in 1882 by the Interments (*Felo de se*) Act, which permits the interment of any *felo de se* in the churchyard or other burial ground of the parish or place in which by the law or custom of England he might have been interred but for the verdict. The interment is carried out in accordance with the Burial Laws Amendment Act 1880 (see BURIAL).

FELONY. Acts involving forfeiture were styled felonies in feudal law, although they had nothing of a criminal character about them. A breach of duty on the part of the vassal, neglect of service, delay in seeking investiture, and the like were felonies; so were injuries by the lord against the vassal. In English law, crimes are usually classified as treason, felony, misdemeanour and summary offence. Some writers—and with some justice—treat treason merely as a grave form of felony, but owing to legislation in and since the time of William and Mary, the procedure for the trial of most forms of treason differs from that of felony. It may be generally stated that a crime is a felony, which, either by common law or by statute is punishable by death and forfeiture of property, or, whatever the punishment, has been declared to be one by act of parliament. (See CRIMINAL LAW; MISDEMEANOUR; MISPRISION.)

The question whether a particular offence is felony or misdemeanour can be answered only by reference to the history of the offence and not by any logical test. For instance, killing a horse in an unlicensed place is still felony under a statute of 1786. But most crimes described as felonies are or have been capital offences at common law or by statute, and have also entailed on the offender attain and forfeiture of goods. A few felonies were not punishable by death, e.g., petty larceny and mayhem. Where an offence is declared a felony by statute, the common law punishments and incidents of trial attach, unless other statutory provision is made.

The principal common law *felonies* were: homicide, rape, larceny (*i.e.*, in ordinary language, theft), robbery (*i.e.*, theft with violence), burglary and kindred offences. Counterfeiting the coin has been made a felony instead of being treason; and forgery of most documents has been made a felony instead of being, as it was at common law, a misdemeanour.

The result of legislative changes is that at the present time the chief practical distinctions between felony and misdemeanour are:—

1. That a private person may arrest a felon without judicial authority and that bail on arrest is granted as a matter of discretion and not as of right.
2. That on a trial for felony the accused has a right peremptorily to challenge, or object to, the jurors called to try him, up to the number of 20.
3. That a felon cannot be tried *in absentia*, and that the jury who try him may not separate during the trial without leave of the court, which may not be given in cases of murder.
4. That peers charged with felony are tried by the king in parliament (the House of Lords) or by the court of the lord high steward.

In the United States, both the Federal and State statutes define felonies as being the most serious crimes, as distinguished from the lesser crimes or misdemeanours. Conviction of a felony may carry with the penalty, imprisonment in the penitentiary instead of a gaol, which is the usual sentence (apart from fines) for those found guilty of misdemeanours. However, a gaol sentence often is imposed in the option of the court. Conviction for some felonies, such as murder, rape and kidnapping, may mean the death penalty in most States.

FELSITE, in petrology, a term which has long been generally used by geologists, especially in England, to designate fine-grained igneous rocks of acid (or subacid) composition. As a rule their ingredients are not determinable by the unaided eye, but they are principally feldspar and quartz as very minute particles. The rocks are pale-coloured (yellowish or reddish as a rule), hard, splintery, much jointed and occasionally nodular. Many contain porphyritic crystals of clear quartz in rounded blebs, more or less idiomorphic feldspar, and occasionally biotite; others are entirely fine-grained and micro- or crypto-crystalline; occasionally they show a fluxional banding; they may also be spherulitic or vesicular. Those which carry porphyritic quartz are known as quartz-felsites; the term soda-felsites has been applied to similar fine-grained rocks rich in soda-feldspar.

Although there are few objections to the employment of felsite as a field designation for rocks having the above characters, it lacks definiteness, and has been discarded by many petrologists as unsuited for the exact description of rocks, especially when their microscopic characters are taken into consideration. Nevertheless the term is an extremely useful one in field geology, as a preliminary description of rocks; both intrusive and volcanic, whose precise nature can later be determined by the usual petrographical methods in the laboratory.

FELSPAR or **FELDSPAR**, a name applied to a group of minerals of great importance as rock constituents. The name "feldspar" was used by Wallerius in his *Mineralogy* (1747) in the Swedish form *feltspat*, meaning feldspar, but it was subsequently written "felspar" by R. Kirwan, who erroneously assumed the derivation of the name from *fels*, a rock. The corrupt form feldspar is now in general use, but in German the old name is preserved in *feldspat*. In composition the feldspars are aluminosilicates of potassium, sodium, calcium and barium. A strontium feldspar has been artificially prepared but is unknown in nature. According to the symmetry of their crystals, the feldspars are divisible into two series, a monoclinic series and a triclinic series.

Monoclinic Series	Orthoclase {Sanidine = Or.
	(KAl Si ₃ O ₈ with some solid solution with NaAl Si ₃ O ₈)
	Celsian (Ba Al ₂ Si ₂ O ₈) = Ce.
	Hyalophane (solid solution of KAl Si ₃ O ₈ with Ba Al ₂ Si ₂ O ₈)

Triclinic Series	{Albite (Na Al Si ₃ O ₈) = Ab.
	Oligoclase
Plagioclase	{Andesine
	{Labradorite
	{Bytownite
	{Anorthite (CaAl ₂ Si ₂ O ₈) = An.
	Microcline (KAl Si ₃ O ₈)
	Anorthoclase (Cryptoperthite) (Solid solution of KAl Si ₃ O ₈ and Na Al Si ₃ O ₈)

All feldspars show a similarity of crystal form, being often prismatic but flattened parallel to the face (010), or elongated parallel to the axis *a* with small prism faces. Anorthoclase has a characteristic habit, the crystals being elongated parallel to the vertical axis, only the faces 110, 110 and 201 being developed. All feldspars cleave readily parallel to 001 and 010, these making angles of 90° in the monoclinic varieties and oblique angles in the triclinic members. Twinned crystals of feldspar are common and the twinning serves to distinguish various members of the group both in hand specimens and by optical methods under the microscope. In the monoclinic series the commonest twin laws are the Carlsbad (twin axis *c*), the Manebach (twin plane 001) and the Baveno (twin plane 021). In the triclinic series, in addition to these three laws, multiple twinning of the albite (twin plane 010) and pericline (twin axis *b*) types is very common. These twins are microscopically recognized by the fine striations seen on the cleavage planes 001 (albite and pericline) 010 (pericline).

Pure feldspars are colourless, but owing to the presence of minute inclusions or the development of alteration products, most natural feldspars are white, pink, yellowish or greenish. Some are used as ornamental stones on account of their colour (*see* AMAZON-STONE); others are prized for their pearly opalescence (*see* MOONSTONE) or for their play of iridescent colours (*see* LABRADORITE and AVENTURINE).

With the exception of microcline, anorthoclase and hyalophane, all the feldspars have been synthetically prepared. Orthoclase, celsian and albite require the use of fluxes for their preparation. Anorthite melts sharply at 1,550° C, but the solid solutions of albite and anorthite exhibit a melting interval. Feldspars readily suffer chemical alteration, the commonest products being kaolin, sericite, various zeolites and calcite. In dynamic metamorphism the anorthite-rich plagioclases break up into albite and a group of calcium aluminium silicates including prehnite, zoisite and grossular, this assemblage being referred to as saussurite.

Albite is the most stable of the feldspars under the action of weathering and is commonly found in detrital sediments. Celsian and hyalophane are rare barium-feldspars, the latter represented by solid solutions of celsian with orthoclase, the limits being arbitrarily fixed as follows: hyalophane Ce₁Or₂→Ce₁Or₆, Celsian Ce₂Or₆→Ce₂Or₂, barium-orthoclase Ce₁Or₆→Ce₂Or₁. Celsian and hyalophane occur rarely as contact minerals in dolomites, notably at Jakobsberg in Sweden and the Binnental in Oberwallis. Tabular crystals of celsian, twinned on the Carlsbad law, have been artificially prepared. Celsian melts at above 1,700° C.

The feldspars are the most important group of rock-forming minerals. They constitute practically 60% of igneous rocks and serve as a basis of classification of these rocks. In sediments only the alkali-feldspars (orthoclase, microcline, albite and oligoclase) attain any importance as rock constituents, but in metamorphic rocks they are all—with the exception of anorthoclase and the barium feldspars—widely distributed. Feldspar (orthoclase) is used industrially in the manufacture of porcelain and it also forms an important constituent of many ceramic glazes. Orthoclase has also been used as a source of potash. More detailed information on the individual feldspars is given under ALBITE, AMAZON-STONE, ANDESINE, ANORTHITE, ANORTHOCLEASE, AVENTURINE, BYTOWNITE, LABRADORITE, MICROCLINE, MOONSTONE, OLIGOCLASE, ORTHOCLEASE and PLAGIOCLASE (*q.v.*). (C. E. T.)

FELSTED or **FELSTEAD**, a village in the Saffron Walden parliamentary division of Essex, England, 10 m. N. from Chelmsford; with a station on the Dunmow and Braintree branch of the L.N.E. railway. Pop. (1921), 2,089. Holy Cross church contains a chapel of the Rich family, including an imposing monument to Richard, 1st Baron Rich of Leeze, lord high chancellor (d. 1658),

who in 1564 founded the grammar school from which the present Felsted school descends. It became a notable educational centre for Puritan families in the 17th century under Martin Holbeach (1627-49) and his successors, C. Glasscock (1650-90), and Simon Lydiatt (1690-1702). John Wallis the mathematician and Isaac Barrow the scholar were educated here, and also four sons of Oliver Cromwell, Robert (d. 1639 and buried in Holy Cross church), Oliver, Richard (the Protector), and Henry. Under the Rev. W. S. Grignon (1823-1907), the headmaster from 1856 to 1875, the school rapidly took a place among the public schools of the modern English type. New buildings were erected in 1864, to which considerable modern additions have since been made.

See John Sargeant, *History of Felsted School* (1889); and *Alumni Felstedenses*, by R. J. Beevor, E. T. Roberts and others (1903).

FELT, a fabric produced by the "matting" or "felting" together of fibrous materials such as wools, hairs, furs, etc. Most textile fibres (see FIBRES) possess the quality of matting to some extent, but wools, furs and some hairs are the only fibres which can be felted satisfactorily. It is probable that the quality of felting must be attributed to the scale structure and waviness of the wools, furs and hairs referred to and to the "fibre-stuff" of which they are composed. When it is desired to incorporate non-felting fibres in felt cloths, wool or fur must be employed to "carry" them.

There are two distinct classes of felts, viz., woven or "thread-structure" felts, and "fibre" or true felts. In the manufacture of thread-structure felts, wools possessing the quality of felting in a high degree are naturally selected; carefully scoured so that the felting quality is not seriously damaged; spun into woollen or worsted yarns possessing the necessary fibre arrangement and twist; woven into cloth of such a character that subsequently satisfactory shrinking and felting may be done; and finally scoured, milled in the stocks or machine or both; dyed and finished on the lines of an ordinary woven fabric. The lighter styles of woven felts may be composed of a single cloth only, but for the heavier styles two or more cloths are woven, one on top of the other, at one and the same time, arrangements being made to stitch the cloths together during the weaving operation. Some special felts are made by cementing or glueing together several layers of fabrics.

Fibre felts are exceedingly interesting from the historical point of view. It is now generally admitted that the art of weaving preceded that of spinning, and it must further be conceded that the art of felting preceded that of weaving, so that the felt fabric is probably one of the oldest of the various styles of recognized fabrics. The inhabitants of the middle and northern regions of Asia seem to have employed felt from time immemorial, as clothing and also as a covering for their habitations. Most of the classical writers refer to it and some of them actually describe its manufacture. Felt was also largely employed by the ancients for their hats, outer garments, and sometimes as a species of armour.

Fibre Felts.—Fibre felts may be divided into three classes, viz., ordinary felts; hat felts; and impregnated felts. As all felts are based upon the ordinary felt, the process of manufacture of this will first be described. Of the wools employed the principal are: East Indian, New Zealand crossbreds, and British. Vegetable fibres and silk are also employed, but wool must be used to "carry" them; thus a good felting wool may be made to carry its own weight of cotton, hemp, etc. Hairs and furs are principally used in the hat felts. Thus beaver felts are made from the fur of the beaver from which the skin has been skilfully cut away by a special apparatus.

The wools used for fibre felts are generally short to medium in lengths, and must have good felting quality and be carefully selected and blended according to the characteristics required in the felt. The order of the manufacturing processes is as follows: willeying, blending, teasing, scribbling, carding, forming, hardening, milling, carbonizing (if not already carbonized in the wool state), dyeing, tentering and finishing.

The scribbled wool is fed on to the carder, the sliver from which is run full width (50 to 80 in.) onto the "former", (which consists of a frame carrying an endless cloth of about 40 yd. long) until

a soft batt or lap has been built up sliver by sliver to required thickness and weight.

The soft batt is then hardened. There are two kinds of hardening machines—the roller hardner and the plate hardner. The roller hardner consists of a frame carrying steam-heated rollers on which runs an endless heavy wet cloth. Working over this cloth are a further number of wood rollers, having an oscillating movement derived from a side shaft with eccentrics. The soft batt is carried through the hardner by the wet cloth, and the steam which is generated by the contact of the wet cloth and the steam-heated rollers, passes through the soft batt, while at the same time the oscillating wooden rollers gradually felt the fibres together till the felt is sufficiently strong to stand the following milling process.

The plate hardner consists of a bottom steam chest with a wet cloth running over it and a top plate, which has a vibratory movement, which can be raised and lowered, in order that the felt may be passed through. All the motions are automatic and the time and throw of the vibratory movement can be varied according to the thickness of the felt being hardened. By careful splicings two or more batts may be hardened together, end to end, into one long piece, or they may be hardened together side by side, thus forming one piece of double width, or two or more batts may be hardened together, one on top of the other, this making one thick piece. In the hardening process, the felting which takes place affects the thickness very considerably, and not the area; but in the subsequent milling process the area is affected very considerably, sometimes as much as 50%, but the thickness is not altered much.

The hardened felt not having any warp or weft is still comparatively weak, and must be handled very carefully in the preliminary milling stages, or damaged places will occur. The hardened felt is now brought in contact with a fulling or milling agent, such as soap, weak acid or weak alkali. The first milling is usually done in the fulling stock, where the felt cloth is continually hammered, and the fibres become interlocked closer and closer together until the required length and width have been obtained, and a cloth of considerable strength produced. The milling process may be finished in the fulling stock, or, according to the kind of felt being produced, it may be finished in the milling machine.

The following processes, viz., dyeing, tentering and finishing, are similar to those used in woollen cloth manufacture, and so do not require to be further explained here.

Variation for Use.—According to the purpose for which fibre felts are required, the variation is very great in weight, quality, hardness and thickness. In weight from 4 oz. per sq.yd. to 35 lb. per sq.yd.; in quality from the finest merino to cow hair; in hardness from a soft padding felt to the hardest metal polishing felt, and in thickness from $\frac{1}{8}$ in. to 4 in.

Some of the uses to which felts are put are saddlery, seatings, carpets, surrounds and underfelts, table felts, shoe and slipper felts, mattress felts, chest preservers, shoulder pads, engineering and motor car felts, antevibration, heat insulating and sound deadening felts, railway and shipbuilding felts, grinding and polishing felts for metal, marble and plate glass, packing felts, gun wad felts, piano and organ felts, filter felts, lithographic and printers' felts, felts for paper-making machines, etc.

Impregnated felts such as ship sheathing and roofing felts are not true felts. In this case a batt made from jute or flax waste is impregnated and held together with a waterproof solution, the basis of which is tar bitumen or resin. Some roofing felts are made from thick porous paper impregnated with a waterproof solution.

Hat felts may be divided into two classes, viz., those made from wool and fur respectively. Wool "bodies" used for the lower quality hats are manufactured in the same way as ordinary felts, but the "shape" upon which the film issuing from the carder is built up takes the form of a double cone and thus approximates to the shape of the two hats ultimately formed. The shape is further controlled and developed in the fulling or felting operation. In the fur hat felts an air-blast is employed to carry the finely separated fibres on to the shape required, upon which shape the fibres are held in position by suction until the required thickness is obtained. The structure is then hand hardened, further developed and "stiffened," i.e., impregnated with certain stiffening agents

according to requirements. If desirable the exterior fibres blown on to any shape may be of a different material from the body fabric. (A. F. B.)

FELTHAM, OWEN (d. 1668), English moralist, was the son of Thomas Feltham or Feltham of Mutford, Suffolk. The date of his birth is given variously as 1602 and 1609. He is famous chiefly as the author of a volume entitled *Resolves, Divine, Moral and Political*, containing one hundred short and pithy essays, to which in later issues he appended *Lusoria*, a collection of 40 poems. Feltham attacked Ben Jonson in an ode shortly before the aged poet's death, but contributed a flattering elegy to the *Jonsonus Virbius* in 1638. In 1652 he published the results of a visit to Flanders under the title of *A Brief Character of the Low Countries*. He died at Great Billing early in 1668. To the middle classes of the 17th century he seemed a heaven-sent philosopher and guide, and was only less popular than Francis Quarles.

Eleven editions of the *Resolves* appeared before 1700. Later editions by James Cumming (1806; much garbled; has account of Feltham's life and writings) and O. Smeaton in "Temple Classics" (1904).

FELTON, CORNELIUS CONWAY (1807–1862), American classical scholar, was born on Nov. 6, 1807, in West Newbury (Mass.). He graduated at Harvard College in 1827, and after teaching in the high school at Geneseo (N.Y.), he became tutor at Harvard in 1829, university professor of Greek in 1832 and Eliot professor of Greek literature in 1834. In 1860 he succeeded James Walker as president of Harvard, which position he held until his death, at Chester (Pa.), on Feb. 26, 1862. Dr. Felton edited many classical texts and made several translations. His annotations on Wolf's text of the *Iliad* (1833) and his *Greece, Ancient and Modern* (2 vols., 1867), were, perhaps, his outstanding works.

FELTON, JOHN (c. 1595–1629), assassin of the 1st duke of Buckingham (q.v.), served in the expedition to Cadiz in 1625, and probably in the expedition to Ré in 1627. He had personal as well as political grievances against Buckingham, whom he stabbed to death at an audience at Portsmouth on Aug. 23, 1628. He was tried on Nov. 27th, pleaded guilty and was hanged.

FELTRE (anc. *Feltria*), a town and episcopal see of Venetia, Italy, province of Belluno, 20 m. W.S.W. of Belluno by rail, situated on an isolated hill, 885 ft. above sea-level. Pop. (1921) 6,300 (town), 19,031 (commune). The Palazzo del Consiglio, now a theatre, is attributed to Palladio. At one end of the chief square of the town, the Piazza Maggiore, is the cistern by which the town is supplied with water, and a large fountain. Various remains of the ancient Feltria have been found from time to time. ("Campanile" in *Notizie degli Scavi*, 1924, 149 sqq.) It lay on the road (Via Claudia) from Opitergium to Tridentum.

FELUCCA, a type of vessel used in the Mediterranean as coasters or fishing-boats. It is a long, low, and narrow undecked vessel, built for speed, and propelled by oars or sails. The sails are lateen-shaped and carried on one or two masts placed far forward (see *BOAT*).

FEMALE, the correlative of male, the sex which performs the function of conceiving and bearing as opposed to the begetting of young. The word in Middle English is *femelle*, adopted from the French from the Lat. *femella*, diminutive of *femina*, a woman. The present termination is due to a connection in ideas with "male." In various mechanical devices the receiving part is often known as the "female," as for example in the "male" and "female screw." The O.Fr. *feme*, modern *femme*, occurs in legal phraseology in *feme covert*, a married woman, i.e., one protected or covered by a husband, and in *feme sole*, a widow or spinster. (See *WOMEN AND HUSBAND AND WIFE*.)

FEMERELL or FUMERELL, the old English term given to the lantern in the ridge of a hall roof for the purpose of letting out the smoke from the central hearth.

FEMINISM, a term of recent origin to designate the motives and ideas that underlie the modern movement in favour of rights for women. It includes the personal and social as well as the political and economic aspects of the movement and has for its object the placing of woman on a complete equality with man.

See *WOMEN, LEGAL POSITION OF; WOMEN'S SUFFRAGE and WOMEN, EDUCATION OF*.

FENCES: see *HEDGES AND FENCES; WIRE; WIRE MANUFACTURES*.

FENCIBLES. In the 18th century in Great Britain, fencibles were regular troops, consisting of cavalry and infantry, raised for home service only, and for the duration of the war. They differed from the local militia which were raised by counties and were only liable to serve in their own county except in case of rebellion or invasion. The first fencible corps raised in Great Britain was in Argyleshire in 1759. Several others were raised in 1778–9. (See further *MILITIA; VOLUNTEERS*.)

FENCING. From its general meaning of the art of defence or offence with the sword, the word "fencing" has become restricted to the art and science of those regulated and artificial conditions which govern single combat, in countries where the duel is still in favour, or competition between two or several persons in countries where swordsmanship is rather a sport than a necessity. But all its teaching is based upon those inevitable principles of practical perfection which emerge when life or death may be decided by the movements of a blade, and the gradual emergence of a deadly simplicity out of archaic complications must be traced in the history of the various forms of the sword itself. The science of fencing first became visible after gunpowder had destroyed the knight in heavy armour and the whole arsenal of armour-cracking weapons began to disappear. Yet it was long before the sword became anything save an implement for heavy downright strokes with edge. Gaps in the harness of the more lightly-clad soldier first suggested concentration of attack upon unprotected portions of his body. By slow degrees it was discovered that, though the edge might always be useful, the point got home far more quickly. At length the sword became not merely an offensive weapon but a shield as well; men fought with one hand only, rejecting the dagger that had once served, in the other, as a protection. Only when the duel had ceased to be anything like the social necessity it remained almost everywhere until the end of the 18th century, was the crowning miracle of the riposte invented, by which the lighter sword-blade not merely turned aside the hostile point but, in one continued phase of movement, replied to the enemy with a thrust that followed almost instantaneously upon the frustration of his original attack.

It was natural that countries which permitted duelling should pay far more attention to fencing than those nations which settled personal quarrels by other means. But good swordsmanship had for so long been a distinctively gentlemanly accomplishment in the English-speaking countries that the fencing taught by Angelo in London was never wholly forgotten even when the swords his first pupils always wore had become the mere decorative adjunct of the soldier on parade or the courtier at some royal ceremony. Before the 19th century had closed, the London Fencing Club became the centre of a small but influential and enthusiastic band of amateurs, who brought the best professional teachers from France and who, at last, dared to enter an English team for the International Fencing Tournament in Paris in 1903.

From that date fencing has grown and flourished on both sides of the Atlantic, and the development of all the possibilities of the épée (which is the French duelling-sword with a button on the point) has introduced a form of sport which takes its due place in the Olympic Games and other international meetings; which is becoming more and more popular every year; which can be enjoyed out of doors or under cover, at any hour of the day or night, and almost at any age. The three weapons are the foil, which is wholly conventional and meant to furnish the foundation of true swordsmanship; the épée, which uses the point alone and can score a hit on any part of the opponent's anatomy; and the sabre, in its light Italian form, which combines the beauties of both point and edge. These three weapons are separately described under their several headings; as are such almost obsolete survivals as Quarterstaff, singlestick and cane-fencing.

Anglo-American Contests.—The Olympiad of 1920, with its apparently inevitable squabble and bickerings, resulted in a special rapprochement between the teams of the United States and

Great Britain and started the competition between the two nations for the Thompson trophy. The first meeting was held in America during Nov. 1921, and resulted in a victory for the United States by 25 points to 21, but Great Britain turned the tables in the summer of 1923. E. Seligman distinguished himself by reaching the final pool of the foil championship in the Olympic Games of 1924 in Paris, when he had to retire owing to a strain, after beating the winner. He also qualified for the second round of the sabre championship and Captain R. Dalglish, R.N., also did well; while C. H. Biscoe reached the semi-final pool of the épée championship. In these same Olympic events, the United States were well represented by Bloomer, Boyce, Calnan, Jeter, Breed, Milner, Gignoux, Macpherson, Lyon and Costner.

In 1923 two Grands Assauts d'Armes were held at the Hotel Cecil and the Grocers' Hall, London, and one in 1924 at the Royal Automobile Club, London. In these many of the most distinguished continental fencers took part, both amateur and professional, including A. Massard, M.C., L. Gaudin, R. L. Heide, C. Lafontan, A. Pope, Aldo Nadi, E. Tack, F. de Smedt, J. Rossignol and many others. In 1927, Professor Tassart arranged another at the New Prince's Galleries, Piccadilly, when were seen Henri Hostalier, Raymond Flacher, Emile Cornic, Roger Ducret and Professor René Haussy.

BIBLIOGRAPHY.—The bibliography of fencing is a copious subject; but it is completely dealt with by Carl A. Thimm, *A Bibliography of Fencing and Duelling* (1896). For French works more especially see Vigeant, *La Bibliographie de l'escrime*, and *Ma Collection d'escrime*. For Italian books, Gelli, *Bibliografia generale della scherma*. For Spain and Portugal, Leguina, *Libros de esgrima españoles y portugueses*. Both M. Vigeant's and Cav. Gelli's works deal with the subject generally but their entries are only critical, or even tolerably accurate, in the case of books belonging to their own countries. Concerning the history of the art, Egerton Castle's *Schools and Masters of Fence* (1884); Hutton's *The Sword and the Centuries*, and Letainturier-Fradin's *Les Joueurs d'épée à travers les âges*, cover the ground. As typical exponents of the French and Italian schools respectively may be mentioned here: Prévost, *La Théorie de l'escrime*, (this is the work which was adopted in the Badminton volume on Fencing), and Parise, *Trattato teorico-pratico della scherma*. French school: L. Rondelle, *Foil and Sabre* (Boston, 1892); C. Prévost "Fencing," in the *Encyclopaedia of Sport* (1901); Edward Breck, *Fencing* (New York, 1906). Italian school: S. de Frae, *Istruzione per la scherma*, etc. (1885); F. Masiello, *La Scherma italiana di spada e di sciabola* (Florence, 1887). See also H. A. C. Dunn, *Fencing* (1924).

Épée.—Among the older works on the history and practice of the small-sword, or épée, are the following: W. H. Gent (Sir William Hope, afterwards baronet), *The Scots Fencing-Master, or Compleat Small-swordsmanship* (Edinburgh, 1687), and several other works by the same author, of later date, for which see Egerton Castle, *Schools and Masters of Fence*; P. G. F. Girard, *Nouveau traité de la perfection sur le fait des armes* (1736); M. Angelo, *L'école des armes* (London, 1763); M. Danet, *L'Art des armes* (1766-1767); Nicolas Demeuse, *Nouveau traité de l'art des armes* (Liège, 1778).

More modern are: la Böessière, Jr., *Traité de l'art des armes* (1818); A. Griser, *Les Armes et le duel* (1847); Bazancourt, *Les Secrets de l'épée* (1862); J. Jacob and Emil André, *Le Jeu de l'épée* (1887); Ambrose Baudry, *L'Escrime pratique au XIX^e siècle*; A. Spinnewyn and Paul Manoury, *L'Escrime à l'épée* (1898); C. Newton-Robinson, "The Revival of the Small-sword," in the *Nineteenth Century and After* (London, January 1905); Dr. Edom, *Nouveau Traité de l'épée*, privately published (Paris, 1908), C. de Bazancourt, *Secrets of the Sword* (1908), and, most important of all, J. Joseph-Renaud, *Méthode d'escrime à l'épée*, privately published (Paris, 1909).

Sabre.—*Infantry Sword Exercise* (British War Office, London, 1896), practically the system of Masiello; L. Barbasetti, *La Scherma per la sciabola* (Vienna, 1898); a German translation of the foregoing, *Das Säbelfechten* (Vienna, 1899); Gustav Hergsell, *Die Fechtkunst* (Vienna, 1892). For the old-style sabre see Alfred Hutton, *Cold Steel* (London, 1889); R. G. Allanson Winn and C. Phillips Wolley, *Broadsword and Singlestick*, "All England" series (London, 1898); L. Rondelle, *Foil and Sabre* (Boston, 1892), an exposition of the French military system. See also, Leon Bertrand, *Cut and Thrust* (1927). For Sabre-fencing for cavalry see Alfred Hutton, *The Cavalry Swordsman* (London, 1867); A. Alessandri and Émile André, *L'Escrime du sabre à cheval* (Paris, 1895). For German basket-sabre and schläger, *Die deutsche Hiebfechtschule für Kork- und Glockenrapier* (Leipzig, 1887), published by the association of German academic fencing-masters; L. C. Roux, *L'Escrime dans les universités allemandes* (Paris, 1885), a French exposition of the German student fencing. *Quarter-Staff*, by T. A. McCarthy (London, 1883). See also CANE-FENCING, ÉPÉE DE COMBAT, QUARTER STAFF, SABRE-FENCING, SINGLESTICK.

(A. R. H.)

United States.—Fencing in the United States is experiencing rapid expansion as a popular sport in the schools, colleges and universities as well as in various fencing clubs. The art always has been followed by a few devotees. For many years it was kept alive mainly by being part of the curriculum at the U.S. Military Academy at West Point, N.Y., and the U.S. Naval Academy at Annapolis, Md. As an organized sport it dates from

1891, when the Amateur Fencers League of America was organized. This league has supervised amateur fencing as a sport since that time. It is a member of the Federation Internationale d'Escrime. Intercollegiate fencing is supervised by the Intercollegiate Fencing Association with 15 colleges and universities as members. This association works in close harmony with the Amateur Fencers League.

IMAGINARY LINES OF ENGAGEMENT
Attacks and parries are given names identifying them with the spot hit; e.g., a thrust at the sixte line is called a thrust in sixte; a parry, at the same section, with hand in supination, is called parry of sixte or, with hand in pronation, parry of tierce

European fencing masters have come to the United States and have done much to spread the sport and improve the quality of fencing.

The United States has been represented in fencing in the Olympic Games; but its teams have been defeated by those of

THE TWO MOST FREQUENTLY USED METHODS OF HOLDING THE FOIL
In the method known as supination the fingers should be closed around handle without overlapping thumb, which must not touch hilt. When the foil is held in pronation, the thumb comes closer to fingers, and back of hand is turned up

France, Italy and Hungary. At the Seventh Olympiad in Antwerp, Belgium, in 1920, the United States team won third place in the foil team competition, defeating all other nations except France and Italy. This is the only occasion on which the United States

THE SEVEN MOVEMENTS NECESSARY FOR COMING ON GUARD

has been an Olympic point winner in team fencing. At the Ninth Olympiad, in Amsterdam, Holland, in 1928, the American fencers in the individual competitions made their best showing in the history of the Olympic Games. Lieut. G. C. Calnan, U.S.N., won third place in the individual épée championship of the world. Dr. Allen Milner reached the finals in the same weapon, as did Joseph Levis in the individual foil competition. The skill of American fencers is constantly increasing and an American team

6. A winning thrust in practice. The object of a fencing-match today is to touch one's opponent while parrying his thrusts

won the Anglo-American contest in 1928.

After the Seventh Olympiad of 1920 there were instituted the British-American matches for the Robert M. Thompson Perpetual Trophy. These matches have created a stimulus for the growth of the art and serve as the occasion for friendly rivalry and sportsmanlike relations between British and American fencers. They are held alternately in the United States and England. The Americans were victorious in 1921 and 1926, when the

matches were held in the United States. The British won in London in 1923. (H. BRE.)

HOW TO FENCE

Foil Fencing.—The target is limited to the bust, which is divided by four imaginary lines varying according to the position of the hand. There are two principal lines, one vertical and one horizontal, which cross each other at the place where the foil is held. For a right-handed fencer the inside-high line or left-high line is the space to left of vertical line and above horizontal line; inside-low line or left-low line is the space at left of vertical and below horizontal line; outside-high line or right-high line is space at right of vertical line and above horizontal line; outside-low line or right-low line is the space at right of vertical line and below horizontal line. For a left-handed fencer it is just the opposite. For each section there are two parries. The parries are direct or circular (counter). The direct parry

EXTENSION AND LUNGE

Assume the position of On Guard, then extend right arm quickly, hand and foil being on line with shoulder. Now straighten left leg and advance right foot to about twice its length at right angles to the left

wards off the opponent's thrust in the same line as the attack was made. The circular parry counter-wards off the opponent's thrust in the opposite line the attack was made by means of a circular movement.

There are two parries for each line. In one the hand is held in supination, in the other in pronation. There are eight parries, each having its counter:

High-line right:—

Tierce: Hand in pronation at height of chest towards right, foil pointed at opponent's eyes.

Sixte: Hand in supination at height of chest towards right, foil pointed at opponent's eyes.

High-line left:—

Quinte: Hand in pronation at height of chin towards left, foil pointed at opponent's waist.

Quarte: Hand in supination at height of chest towards left, foil pointed at opponent's eyes.

Low-line right:—

Seconde: Hand in pronation at height of waist, towards right, foil pointed at opponent's groin.

Octave: Hand in supination at height of waist towards right, foil pointed at opponent's groin.

Low-line left:—

Prime: Hand in pronation at height of waist towards left, foil pointed to left and above hand.

Septime: Hand in supination at height of chest towards left, foil pointed at groin.

In executing all these parries the hand must not travel beyond the body.

In the on guard position the legs and arms are bent, ready for quick action, whether for attack or for defence. The attack is the ensemble of movements by which one tries to touch an opponent, and of which the last is called "coup" (hit) and consists in bringing the point of the foil squarely on the opponent's body. The attack is made by lunging, marching or running (*flèche*). The

lunge immediately follows the extension of the arm and consists of bringing the forward foot forward and at the same time straightening the other leg, the foot remaining in place. The march consists in bringing the forward foot forward to be followed immediately by the other one, retaining the on guard position. In the running attack or *flèche* one brings the back foot

PARRY OF PRIME, AN EFFECTIVE GUARD FOR LEFT SIDE

The parry of prime is used in covering both high and low lines. It is made from guard by moving hand toward the left shoulder, dropping point down sharply and turning back of hand upward and outward as far as possible

in front of the other one, and so on. The march and the *flèche* can be done backwards by reversing the movements.

With the foil an attack correctly executed must be parried or else completely evaded. The attack is correct when the arm is properly extended before the lunge or advance. The feint is the semblance of an attack and is done by extending the arm without trying to touch, its aim being to make the adversary try to parry this movement, and then to deceive the intended parry. The false attack is a feint with a displacement of the body and has the same purpose as the feint. The attack may be simple (when not preceded by a feint) or composed (when preceded by one or many feints or by a bind on the blade). The attack on the blade, or bind, is the action (beat, press or shove aside) of removing the

PARRY OF SECONDE, TO GUARD LOWER RIGHT-HAND SIDE

With a slight but quick downward movement of the hand, catch adversary's blade and turn it aside. The foil is held in pronation

opponent's blade when in a threatening position, also to open the line. The bind is a movement by which one brings the opponent's blade from the high-line to the low-line, the low-line being the target and vice-versa. There are three simple attacks: straight thrust, disengage and the cut-over. In the straight thrust one touches the opponent in the same line as one is engaged in. The disengage is carried in another line than the one one is engaged in, by passing the tip of the blade under the opponent's blade. The cut-over is a disengage, executed by passing the point of the foil above the opponent's blade at the same time flexing slightly

the arm. The composed attack ends always by one of the aforementioned attacks. The riposte follows the parry and is done by extending the arm without moving the body, or by any other combinations of attack. The counter-riposte follows the parry of the riposte and can be made on the lunge or any of the other riposte combinations. The attack on preparation starts from complete immobility and surprises the opponent on his preparation

PARRY OF TIERCE, FOR GUARDING UPPER RIGHT-HAND SIDE

Move foil quickly across body from left to right, sweeping aside adversary's blade and protecting right breast

of attack. The time-thrust is at the same time a parry and a riposte. The stop-thrust stops the opponent on his advance. The "remise" is a time-thrust on a riposte or on a counter-riposte. The redoublement is a second attack after the first one has been parried without riposting.

Épée or Duelling Sword.—There are no conventions in fencing with this weapon. The touches are valid on any part of the body. The space between the feet when on guard is less than with the foil, but the arm is more extended. The defensive work consists generally of time-thrusts and stop-thrusts. The attacks are simpler than with the foil and generally with binds on the

PARRY OF QUARTE, FOR GUARDING LEFT-HAND SIDE OF BODY

This is the most important parry and is more used than any of the others. It is executed by moving blade toward the left until the forte encounters the foible of adversary's foil and throws it aside. Fingers and wrist should be used as much as possible

blade. The parries and ripostes, etc., are the same as for the foil.

Sabre Fencing.—The target is limited to the upper part of the body. The touches are made mostly by cuts instead of thrusts, the cuts being: head-cut, right and left cheek-cut, flank-cut, the banderole (cut from the left shoulder to the waist) and the cut on the cuff. The thrusts are made the same way as with the foil, but are generally limited to simple attacks. The movements are wider and far more spectacular than those of the other weapons. The attacks are usually made by attacks on the blade with advance so as to gather speed. (R. Pt.)

FEN COUNTY: see FENS.

FENDER, a metal guard or defence as for a motor car or fireplace. In the latter instance when the open hearth with its logs burning upon fire-dogs or andirons (*qq.v.*) was replaced by the closed grate, the fender was devised as a finish to the smaller fire-places, and as a safeguard against the dropping of cinders upon the wooden floor, which was now much nearer to the fire. Fenders are usually of steel, brass or iron, solid or pierced. Those made of brass in the latter part of the 18th and the earlier part of the 19th centuries are by far the most elegant and artistic. They usually had three claw feet, and the pierced varieties were often cut into arabesques or conventional patterns. The modern fender is much lower and is often little more than a curb.

FÉNELON, FRANÇOIS DE SALIGNAC DE LA MOTHE (1651-1715), French writer and archbishop of Cambrai, was born at the château of Fénelon in Périgord on Aug. 6, 1651. His father, Pons, comte de Fénelon, was a country gentleman of ancient lineage, large family and small estate. He was educated at home and at the neighbouring University of Cahors. In 1666 he came to Paris, under charge of his father's brother, Antoine, marquis de Fénelon, and in 1669 he entered the college of Saint Sulpice. He contemplated a missionary journey to the Levant, but the plan was vetoed, and he remained at Saint Sulpice till 1679, when he was made "superior" of a "New Catholic" sisterhood in Paris—an institution devoted to the conversion of Huguenot ladies. In the winter of 1685, just after the revocation of the edict of Nantes, Fénelon was put at the head of a mission to the Protestants of Saintonge. To Fénelon such employment was clearly uncongenial; but if he employed bribery and espionage among his proselytes, his general conduct was kindly and statesmanlike. But neither in his actions nor in his writings is there the least trace of that belief in liberty of conscience ascribed to him by 18th-century philosophers.

Meanwhile the marquis de Fénelon had introduced his nephew into the devout section of the court, dominated by Mme. de Maintenon. He became a favourite disciple of Bossuet, and at the bishop's instance undertook to refute certain metaphysical errors of Father Malebranche. In the philosophical *Treatise on the Existence of God*, which he wrote for the purpose, Fénelon rewrote Descartes in the spirit of St. Augustine. More important were his *Dialogues on Eloquence*, pleading for greater simplicity and naturalness in the pulpit, and urging preachers to take the scriptural, natural style of Bossuet as their model, rather than the coldly analytic eloquence of his great rival, Bourdaloue. His *Treatise on the Education of Girls* was probably the most influential of all Fénelon's books, and guided French ideas on the question all through the 18th century. It holds a most judicious balance between the *précieuses*, enthusiasts for the "higher" education of their sex, and the heavy Philistines, who thought that the less girls knew the better they were likely to be. Fénelon sums up in favour of the cultivated housewife; his first object was to persuade the mothers to take charge of their girls themselves, and bring them up to be suitable wives and mothers in their own generation.

The Royal Tutor.—In 1689 Fénelon was gazetted tutor to the duke of Burgundy, eldest son of the dauphin, and eventual heir to the crown. The character of this strange prince has been drawn once for all by Saint-Simon. Brilliant, passionate to the point of mania, but utterly weak and unstable, he was capable of developing into a saint or a monster, but quite incapable of becoming an ordinary human being. Fénelon transformed him into a devotee, exceedingly affectionate, earnest and religious, but woefully lacking in tact and common sense. Fénelon's tutorship ended with his disgrace in 1697, before the pupil was 15.

The abiding result of his tutorship is a code of carefully graduated moral lessons—the *Fables*, the *Dialogues of the Dead* (a series of imaginary conversations between departed heroes), and finally *Télémaque*, where the adventures of the son of Ulysses in search of a father are made into a political novel with a purpose. Not, indeed, that Fénelon meant his book to be the literal paper Constitution some of his contemporaries thought it. Like other

Utopias, it is an easy-going compromise between dreams and possibilities. Its object was to broaden Burgundy's mind, and ever keep before his eyes the "great and holy maxim that kings exist for the sake of their subjects, not subjects for the sake of kings." Here and there Fénelon's work is prophetic of the age of Rousseau—in the fervid denunciation of war, the belief in nature and the fraternity of nations. He has a truly 18th-century belief in paternal government. Mentor proposes to "change the tastes and habits of the whole people, and build up again from the very foundations." Fénelon is on firmer ground when he leads a reaction against the "mercantile system" of Colbert, or insists on the importance of agriculture. Valuable and far-sighted as were these ideas, they fitted but ill into the scheme of a romance. Seldom was Voltaire wider of the mark than when he called *Télémaque* a Greek poem in French prose. But although no single feature of the book is Greek, there hangs round it a moral fragrance only to be called forth by one who had fulfilled the vow of his youth, and learnt to breathe, as purely as on "the double summit of Parnassus," the very essence of the antique.

Mme. Guyon.—*Télémaque* was published in 1699. Four years before, Fénelon had been appointed archbishop of Cambrai, one of the richest benefices in France. Soon afterwards, however, came the great calamity of his life. In the early days of his tutorship he had met the Quietist apostle, Mme. Guyon (*q.v.*), and had been struck by her ideas. These he developed along lines of his own, where Christian Neoplatonism curiously mingles with theories of chivalry and disinterestedness, borrowed from the *précieuses* of his own time. His mystical principles are set out at length in his *Maxims of the Saints*, published in 1697. Here he argues that the more love we have for ourselves, the less we can spare for our Maker. Perfection lies in getting rid of selfhood altogether—in never thinking of ourselves, or even of the relation in which God stands to us. The saint does not love Christ as his Redeemer, but only as *the* Redeemer of the human race. Bossuet (*q.v.*) attacked this position as inconsistent with Christianity. Fénelon promptly appealed to Rome, and after two years of bitter controversy his book was condemned by Innocent XII. in 1699. One of the results of the quarrel was Fénelon's banishment from court; for Louis XIV. had ardently taken Bossuet's side. Fénelon was exiled to his diocese, and during the last 18 years of his life he was only once allowed to leave it.

Even Saint-Simon allows that his episcopal duties at Cambrai were perfectly performed. His diocese was administered with great strictness, and yet on broad and liberal lines. Saint-Simon bears the same witness to his government of his palace. There he lived with all the piety of a true pastor, yet with all the dignity of a great nobleman. With all its luxuries, his house remained a true bishop's palace, breathing the strictest discipline and restraint. And of all this chastened dignity the archbishop was himself the ever-present, ever-inimitable model—in all that he did the perfect churchman, in all the high-bred noble, in all things, also, the author of *Télémaque*.

The blot on this ideal existence was his persecution of the Jansenists (*see* JANSENISM). Fénelon's theories of life were different from theirs; and they had attacked his *Maxims of the Saints*, holding that visionary theories of perfection were ill-fitted for a world where even the holiest could scarce be saved. To suppress the Jansenists he was even ready to strike up an alliance with the Jesuits, and force on a reluctant France the doctrine of papal infallibility. His time was much better employed in fitting his old pupil, Burgundy, for a kingship that never came. Louis XIV. seldom allowed them to meet, but for years they corresponded; this exchange of letters became still more frequent in 1711, when the wretched dauphin died and left Burgundy heir-apparent to the throne. Fénelon now wrote a series of memorable criticisms on the government of Louis XIV. Much more clearly than most men, he saw that the Bourbons were tottering to their fall.

In 1712 Burgundy died, and with him died all his tutor's hopes of reform. From this moment his health began to fail, though he mustered strength enough to write the *Letter to the French Academy* (1714), a series of general reflections on the literary movement of his time. As in his political theories, the critical element

is much stronger than the constructive. Fénelon was feeling his way away from the rigid standards of Boileau to "a Sublime so simple and familiar that all may understand it." But some of his methods were remarkably erratic; he was anxious, for instance, to abolish verse, as unsuited to the genius of the French. In other respects, however, he was far before his age. The 17th century had treated literature as it treated politics and religion; each of the three was cooped up in a water-tight compartment by itself. Fénelon was one of the first to break down these partition-walls, and insist on viewing all three as products of a single spirit, seen at different angles.

A few weeks after the *Letter* was written, Fénelon met with a carriage-accident. On Jan. 7, 1715, he died at the age of 63. Fénelon has been made by turns into a sentimentalist, a mystical saint, an 18th century *philosophe*, an ultramontane churchman and a hysterical hypocrite. And each of these views, except the last, contains an element of truth. More than most men, Fénelon "wanders between two worlds—one dead, the other powerless to be born." He came at a time when the characteristic ideas of the 17th century—the ideas of Louis XIV., of Bossuet and Boileau—had lost their savour, and before another creed could arise to take their place. Hence, like most of those who break away from an established order, he seems by turns a revolutionist and a reactionary. Such a man expresses his ideas much better by word of mouth than in the cold formality of print; and Fénelon's contemporaries thought far more highly of his conversation than his books. Saint-Simon has left a portrait of Fénelon as he appeared about the time of his appointment to Cambrai—tall, thin, well-built, exceedingly pale, with a great nose, eyes from which fire and genius poured in torrents, a face curious and unlike any other, yet so striking and attractive that, once seen, it could not be forgotten. There were to be found the most contradictory qualities in perfect agreement with each other—gravity and courtliness, earnestness and gaiety, the man of learning, the noble and the bishop. But all centred in an air of high-bred dignity, of graceful, polished seemliness and wit—it cost an effort to turn away one's eyes.

BIBLIOGRAPHY.—The best complete edition of Fénelon was brought out by the abbé Gosselin of Saint Sulpice (10 vols., 1851). Gosselin also edited the *Histoire de Fénelon*, by Cardinal Bausset (4 vols., 1850). Modern authorities are E. de Broglie, *Fénelon à Cambrai* (1885); P. Janet, *Fénelon* (1892); L. Crouslé, *Bossuet et Fénelon* (2 vols., 1894); J. Lemaître, *Fénelon* (1910). In English there are: *Fénelon, his Friends and Enemies*, by E. K. Sanders (1901); and *François de Fénelon*, by Lord St. Cyres (1906); *see also the Quarterly Review* for Jan. 1902, and M. Masson, *Fénelon et Madame Guyon* (1907).

FENESTELLA, Roman historian and encyclopaedic writer, flourished in the reign of Tiberius. If the notice in Jerome be correct, he lived from 52 B.C. to A.D. 19 (according to Pliny, N.H. xxxiii, 35 B.C.—A.D. 36). Taking Varro for his model, Fenestella represented the new style of historical writing which discussed curious incidents and customs of political and social life, and literary history. He was the author of an *Annales*, probably from the earliest times down to his own days. The fragments indicate the great variety of subjects discussed: the origin of the appeal to the people (*provocatio*); the use of elephants in the games; the wearing of gold rings; the introduction of the olive tree; the material for making the toga; the cultivation of the soil; details as to the lives of Cicero and Terence. The work was much used by Pliny the elder, Asconius Pedianus (the commentator on Cicero), Nonius, and the philologists.

Fragments in H. Peter, *Historicorum Romanorum fragmenta* (1883); *see also* monographs by L. Mercklin (1844) and J. Poeth (1849); M. Schanz, *Geschichte der röm. Litt.* ed. 2 (1901); Teuffel, *Hist. of Roman Literature*, p. 259. A work published under the name of L. Fenestella (*De magistratibus et sacerdotiis Romanorum*, 1510) is really by A. D. Fiocchi, canon and papal secretary, and was subsequently published as by him (under the latinized form of his name, Floccus), edited by Aegidius Witsius (1561).

FENESTRAL, a frame on which oiled paper or thin cloth was strained to keep out wind and rain when windows were not glazed.

FENESTRATION, an architectural term applied to the arrangement of windows on the outside walls of a building, more

especially when they constitute its chief architectural embellishment.

FÊNG HUANG, one of the four symbolical creatures which in Chinese mythology are believed to keep watch and ward over the Celestial Empire. It was begotten by fire, was born in the Hill of the Sun's Halo, and its body bears inscribed on it the five cardinal virtues. It has the breast of a goose, the hind-quarters of a stag, a snake's neck, a fish's tail, a fowl's forehead, a duck's down, the marks of a dragon, the back of a tortoise, the face of a swallow, the beak of a cock, is about six cubits high, and perches only on the wu-tung tree. Its appearance heralds an age of universal virtue. The name is Chinese for "phoenix."

FENG-TIEN: see MANCHURIA.

FÊNG YŪ-HSIANG (1880—), Chinese military leader, was born in Chaohsien in the province of Anhwei, and is generally known as "the Christian General" from his early adoption of Christianity of a Baptist and Evangelical type. His education and training were purely military, and he saw active service under Chao Êrh-fêng in Tibet in 1909. In 1912 he was in Sianfu in the 20th Division under the command of Lu Yung-hsiang, whose daughter he married. At the Revolution he had attained the rank of major and was at Shanhaikwan; from there he was promoted brigade commander in the army controlling Chihli and the capital. His acceptance of, and consistent adherence to, Republican principles date from this period and have formed a salient feature of his subsequent career. Under Wu Pei-fu he took part in the defeat of the Anfu Group, and thereafter re-organized his famous 11th Division.

General Feng obtained his first independent command early in 1921 when his Division was despatched into Shensi to restore order in that province, and in August, upon the death of the military governor, he was given the acting appointment. Both as Tuchun of Shensi, and in Honan, to which province he was transferred in the following year, Feng and his troops earned the highest encomiums. The complete suppression of banditry, the discouragement of poppy cultivation, extensive road construction works, and an effort to re-establish honesty in public accounts, were among the measures standing to his credit, while strict discipline and an active if somewhat "corybantic" display of Christian practices in his army were evidence of his zeal for good administration.

In Oct. 1922 he attended a military conference with Tsao Kun and Wu Pei-fu at Paoting, and shortly afterwards his Division was transferred to Peking, where its disciplined efficiency and the strength of purpose of its commander, made their influence felt. In the spring of 1923 Feng was appointed, by mandate of President Li Yüan-hung, commissioner of frontier defence for the North-West, but owing to the unstable political position in the capital he deferred taking up his new duties. With his assistance Li was driven from office in June by Tsao Kun, and upon the latter's assumption of the presidency, Feng addressed a memorial to him appealing for reforms in the administration. During the ensuing year he became convinced of Tsao Kun's inability to form a stable government and he opposed the resumption of the war against Chang Tso-lin. By a *coup de main* he descended upon Peking, causing the defeat and flight of Wu, and in co-operation with Chang he installed Tuan Chi-jui as "Chief Executive," thereafter leaving for the North-West. In Kalgan, Suiyuan and Paotowchen, his administrative gifts again found scope. Colonization plans for Mongolia, ruthless suppression of lawlessness, and other measures making for peaceful development marked his stay. He had depended for ammunition and military equipment upon German importations via Urga, and in March 1926 he visited Moscow, returning in August. He was now formally enrolled as an adherent of the Kuomintang, and his co-operation with the Nationalist allies throughout 1927, although his troops were but slightly engaged, conduced to the success of the campaign.

FENIANS or FENIAN BROTHERHOOD, the name of a modern Irish-American revolutionary secret society, founded in America by John O'Mahony (1816-1877) in 1858. The name was derived from *fiann*, *féinne*, the legendary band of warriors in Ireland led by Find Mac Cumhail (see FINN MAC CUMHAIL). After the collapse of William Smith O'Brien's attempted rising in 1848, O'Ma-

hony, who was concerned in it, escaped abroad, and about 1858 established, in the United States, the "Fenian Brotherhood," whose members bound themselves by an oath of "allegiance to the Irish Republic, now virtually established," and swore to take up arms when called upon and to yield implicit obedience to their superior officers. The organization was modelled on that of the French Jacobins at the Revolution, and it had ramifications in every part of the world, the "Fenians," as they soon came to be generally called, being found in Australia, South America, Canada, and above all, in the United States, as well as in the large centres of population in Great Britain such as London, Manchester and Glasgow. It is, however, noteworthy that Fenianism never gained much hold on the tenant-farmers or agricultural labourers in Ireland. The movement was denounced by the priests of the Catholic Church.

After a convention held at Chicago under O'Mahony's presidency in Nov. 1863 the movement began to show signs of life. About the same time the *Irish People*, a revolutionary journal, was started in Dublin by James Stephens. At the close of the American Civil War, in 1865, numbers of Irish who had borne arms flocked to Ireland, and the plans for a rising matured. The Government, well served as usual by informers, now took action. In Sept. 1865 the *Irish People* was suppressed, and several of the more prominent Fenians were sentenced to terms of penal servitude, though Stephens, through the connivance of a prison warder, escaped to France. The Habeas Corpus Act was suspended in 1866, a considerable number of persons were arrested, and some small disturbances were suppressed by the police.

In the United States the Fenian Brotherhood made open plans for a raid into Canada. The command was entrusted to John O'Neill, who crossed the Niagara river at the head of some 800 men on June 1, 1866, and captured Fort Erie. But large numbers of his men deserted, and at Ridgeway the Fenians were routed by a battalion of Canadian volunteers. On June 3 the remnant surrendered to the American warship "Michigan." A second raid, in 1870, was equally unsuccessful, Henri Le Caron, "Inspector-general of the Irish Republican Army," being a secret agent of the English Government. An attempt at insurrection in 1867 in South and West Ireland and Lancashire had also been frustrated by an informer, John Joseph Corydon. On Sept. 18, 1867, when Thomas J. Kelly and Capt. Deasy, two prisoners arrested during this "rebellion," were being conveyed through Manchester from the court-house, the prison van was attacked by Fenians and in the scuffle Police-sergeant Brett was shot dead. Condon, Allen, Larkin, Maguire and O'Brien, who had taken a prominent part in the rescue, were arrested. All five were sentenced to death; but Condon, who was an American citizen, was respited at the request of the United States Government, his sentence being commuted to penal servitude for life, and Maguire was granted a pardon. Allen, Larkin, and O'Brien were hanged on Nov. 23, and are frequently referred to as the "Manchester Martyrs." In the same month, one Richard Burke, a Fenian agent, was lodged in Clerkenwell prison in London. While he was awaiting trial a wall of the prison was blown down by gunpowder, the explosion causing the death of 12 persons, and the maiming of some 120 others. For this Michael Barrett suffered the death penalty. In 1870, Michael Davitt (*q.v.*) was sentenced to 15 years' penal servitude for participation in the Fenian conspiracy; and before he was released the name Fenian had become practically obsolete, though the "Irish Republican Brotherhood" and other organizations in Ireland and abroad carried on the same tradition. (See IRELAND, *History*.)

FENN, GEORGE MANVILLE (1831-1909), English author, known as the writer of a number of boys' books of considerable popularity. His journalistic work included many contributions to *Chambers' Journal* and *Cassell's Magazine*, of which he became editor in 1870. He was also the author of several novels and plays.

FENNEC, the name applied to several desert-dwelling species of fox, characterized by the great length of the ears and small size. The true fennec (*Vulpes zerda*) inhabits North Africa and is pale in colour with a short, black-tipped tail. South of the

Zambezi the group reappears, being represented by the ass-fox (*V. cama*), a dark-coloured, long-tailed species. The northern fennec (*V. famelicus*) is intermediate between the fennecs and typical foxes. (See Fox.)

FENNEL, *Foeniculum officinale*, a perennial plant of the family Umbelliferae, from 2 to 3 or (when cultivated) 4 ft. in height, having leaves three or four times pinnate, with numerous linear or awl-shaped segments, and glaucous compound umbels of about 15 or 20 rays, with no involucre, and small yellow flowers, the petals incurved at the tip. The fruit is laterally compressed, five-ridged, and has a large single resin-canal or "vitta" under each furrow. The plant appears to be of south European origin, but is now met with in various parts of Britain and temperate Europe generally, and western Asia. The dried fruits of cultivated plants from Malta have an aromatic taste and odour, and are used for the preparation of fennel water, valued for its carminative properties. The shoots of fennel are eaten blanched, and the seeds are used for flavouring.

FROM KOHLER, "MEDIZINAL PFLANZEN"
FENNEL (*FOENICULUM OFFICINALE*), AN AROMATIC PLANT, SHOWING HABIT OF GROWTH AND FLOWERS IN COMPOUND CLUSTERS

Giant fennel is the name applied to *Ferula communis*, a member of the same family, and a fine herbaceous plant, often cultivated, native to the Mediterranean region, where the pith of the stem, which grows 8 ft. to 12 ft. high, is used for tinder. Hog's or sow fennel (*Pucedanum officinale*) is another member of the Umbelliferae.

FENNER, DUDLEY (c. 1558-1587), English puritan divine, was born in Kent and educated at Cambridge University but becoming an adherent of the presbyterian Thomas Cartwright (1535-1603), had to leave without taking his degree. He followed Cartwright to Antwerp, and preached to the English congregation there. The leniency shown by Archbishop Grindal encouraged him to return to England, and he became curate of Cranbrook in 1583. In the same year, however, he was suspended and imprisoned for refusing to sign an acknowledgment of the queen's supremacy and of the authority of the Prayer Book and articles. After his release he became chaplain in the Reformed church at Middleburgh. His works rank among the best expositions of the principles of puritanism; see list in Cooper's *Athenae Cantabrigienses* (Cambridge, 1858-61).

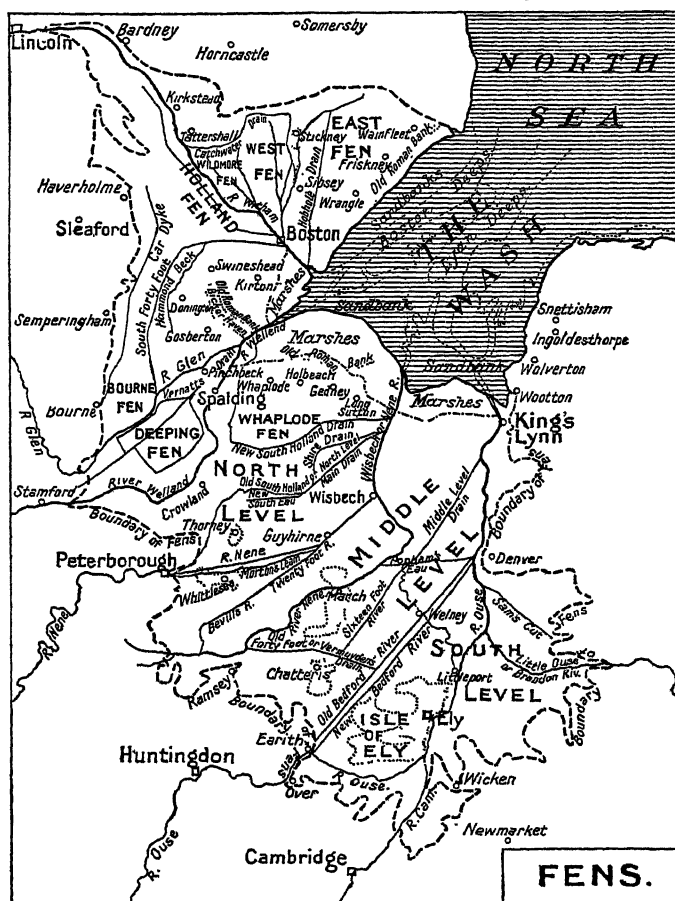

FENNY STRATFORD, a market town in the Buckingham parliamentary division of Buckinghamshire, England, 47½ m. N.W. by N. of London on the Bedford branch of the L.M.S. railway. Pop. of civil parish (1921) 4,305. It lies in an open valley on the west (left) bank of the Ouzel, where the great north-western road from London, the Roman Watling Street, crosses the stream, and is 1 m. E. of Bletchley junction. The church of St. Martin was built (1730) on the site of an older church at the instance of Browne Willis, an eminent antiquary (d. 1760), buried here; but the building has been greatly enlarged. A custom instituted by Willis on St. Martin's Day (Nov. 11), and still observed, includes a service in the church, the firing of some small cannon called the "Fenny Poppers," and other celebrations.

FENRIR or **FENRIS**, in Scandinavian mythology, a water-demon in the shape of a huge wolf, was the offspring of Loki and the giantess Angurboda. He grew so large that the gods, in fear, had him chained up. He broke the first two chains. The third, a magic bond made of the sound of a cat's footsteps, a woman's beard, the roots of a mountain, a fish's breath and a bird's spittle, held him until Ragnarok (Judgment Day), when he escaped and swallowed Odin but was slain by Vidar, the latter's son.

FENS, a district in the east of England, possessing a distinctive history and peculiar characteristics. It lies west and south of the Wash, in Lincolnshire, Huntingdonshire, Cambridgeshire and

Norfolk, and extends over more than 70 m. in length (Lincoln to Cambridge) and some 35 m. in maximum breadth (Stamford to Brandon in Suffolk), its area being considerably over half a million acres. Although low and flat, and seamed by innumerable water-courses, the entire region is not, as the Roman name of *Metaris Aestuarium* would imply, a river estuary, but a bay of the North sea, silted up, of which the Wash is the last remaining portion. Hydrographically, the Fens embrace the lower parts of the drainage-basins of the rivers Witham, Welland, Nene and Great Ouse; and against these streams, as against the ocean, they are protected by earthen embankments, 10 to 15 ft. high. As a rule the drainage water is lifted off the Fens into the rivers by means of steam-pumps, formerly by windmills.

General History.—In very early days there is reason to believe that the whole fenland consisted of forest, but Sir Robert Cotton discovered at Conington in Lincolnshire the skeleton of a sea-fish lying six feet below the ground. (See Sir William Dugdale, *History of Imbanking and Drainage*, 1662.) Oak, ash, fir and nut trees, buried in the soil; canoes and flat-bottomed rafts found several feet below the natural beds of rivers; prehistoric beasts and reptiles dug up in a perfect state of preservation; all point to the existence of diverse forms of life before an historic period. Then came a great sea-quake which caused immense tidal waves to sweep over the area, transforming it into a vast lake. After a time the water did not flow wholly over the land

as the muddiness of the stream produced a sandy settlement; silt formed and checked the usual flowing of the tides.

EARLY ATTEMPTS AT DRAINAGE

According to fairly credible tradition, the first systematic attempt to drain the Fens was made by the Romans. They dug a catchwater drain (as the artificial fenland water-courses are called), the Caer or Car dyke, from Lincoln to Ramsey (or, according to Stukeley, as far as Cambridge), along the western edge of the Fens, to carry off the precipitation of the higher districts which border the fenland, and constructed alongside the Welland and on the seashore earthen embankments, of which some 150 m.

survive. S. H. Miller is disposed to credit the native British inhabitants of the Fens with having executed certain of these works. The Romans also carried causeways over the country. After their departure from Britain in the first half of the 5th century the Fens fell into neglect; and despite the preservation of the woodlands for the purposes of the chase by the Norman and early Plantagenet kings, and the unsuccessful attempt which Richard de Rulos, chamberlain of William the Conqueror, made to drain Deeping fen, the fenland region became almost everywhere waterlogged, and relapsed to a great extent into a state of nature. In addition to this it was ravaged by serious inundations of the sea, for example, in the years 1178, 1248 (or 1250), 1288, 1322, 1335, 1467, 1571. Yet the fenland was not altogether a wilderness of reed-grown marsh and watery swamp. At various spots, more particularly in the north and in the south, there existed islands of firmer and higher ground, resting generally on the boulder clays of the Glacial epochs and on the inter-Glacial gravels of the Palaeolithic age. In these isolated localities members of the monastic orders (especially at a later date the Cistercians) began to settle after about the middle of the 7th century. At Medeshampstead (*i.e.*, Peterborough), Ely, Crowland, Ramsey, Thorney, Spalding, Peakirk, Swineshead, Tattershall, Kirkstead, Bardney, Sempringham, Bourne and numerous other places, they made settlements and built churches, monasteries and abbeys. In spite of the incursions of the predatory Northmen and Danes in the 9th and 10th centuries, and of the disturbances consequent upon the establishment of the Camp of Refuge by Hereward the Wake in the fens of the Isle of Ely in the 11th century, these scattered outposts continued to shed rays of civilization across the lonely Fenland down to the dissolution of the monasteries in the reign of Henry VIII. Then they, too, were partly overtaken by the fate which befell the rest of the Fens; and it was only in the end of the 18th and the beginning of the 19th century that the complete drainage and reclamation of the Fen region was finally effected. Attempts on a considerable scale were indeed made to reclaim them in the 17th century, and the work as a whole forms one of the most remarkable chapters of the industrial history of England.

A larger work than these, however, was the drainage of the fens of the Nene and the Great Ouse, comprehending the wide tract known as the Bedford level. This district took name from the agreement of Francis, earl of Bedford, the principal landholder, and 13 other adventurers, with Charles I. in 1634, to drain the level, on condition of receiving 95,000 ac. of the reclaimed land. A partial attempt at drainage had been made (1478-90) by John Morton, when bishop of Ely, who constructed Morton's Leam, from Peterborough to the sea, to carry the waters of the Nene, but this also proved a failure. An act was passed, moreover, in 1602 for effecting its reclamation; and Lord Chief Justice Popham (whose name is preserved in Popham's Eau, south-east of Wisbech) and a company of Londoners began the work in 1605; but the first effectual attempt was that of 1634. The work was largely directed by the Dutch engineer Cornelius Vermuyden, who had begun work in the Fens in 1621, and was knighted in 1628.

Three years after the agreement of the earl of Bedford and his partners with the king, after an outlay of £100,000 on the part of the company, the contract was annulled, on the fraudulent plea that the works were insufficient; and an offer was made by King Charles to undertake its completion on condition of receiving 57,000 ac. in addition to the amount originally agreed on. This unjust attempt was frustrated by the breaking out of the civil war; and no further attempt at drainage was made until 1649, when the parliament reinstated the earl of Bedford's successor in his father's rights. After an additional outlay of £300,000, the adventurers received 95,000 ac. of reclaimed land, according to the contract, which, however, fell far short of repaying the expense of the undertaking. In 1664 a royal charter was obtained to incorporate the company, which still exists, and carries on the concern under a governor, six bailiffs, 20 conservators, and a commonalty, each of whom must possess 100 ac. of land in the level, and has a voice in the election of officers. The conservators must each possess not less than 280 ac., the governor and bailiffs each

400 ac. The original adventurers had allotments of land according to their interest of the original 95,000 ac.; but Charles II., on granting the charter, took care to secure to the crown a lot of 12,000 ac. out of the 95,000, which, however, is held under the directors, whereas the allotments are not held in common, though subject to the laws of the corporation. The level was divided in 1697 into three parts, called the North, Middle, and South levels—the second being separated from the others by the Nene and Old Bedford rivers.

These attempts failed owing to the determined opposition of the native fenmen ("stilt-walkers"), whom the drainage and appropriation of the unenclosed fenlands would deprive of valuable and long-enjoyed rights of commonage, turbary (turf-cutting), fishing, fowling, etc. Oliver Cromwell is said to have put himself at their head and succeeded in stopping all the operations. When he became Protector, however, he sanctioned Vermuyden's plans, and Scottish prisoners taken at Dunbar, and Dutch prisoners taken by Blake in his victory over Van Tromp, were employed as the workers. Vermuyden's system, however, was exclusively Dutch; and while perfectly suited to Holland it did not meet all the necessities of East Anglia. He confined his attention almost exclusively to the inland draining and embankments, and did not provide sufficient outlet for the waters themselves into the sea.

Holland and other Fens on the west side of the Witham were finally drained in 1767, although not without much rioting and lawlessness; and a striking account of the wonderful improvements effected by a generation later is recorded in Arthur Young's *General View of the Agriculture of the County of Lincoln* (London, 1799). The East, West and Wildmore fens on the east side of the Witham were drained in 1801-07 by John Rennie, who carried off the precipitation which fell on the higher grounds by catch-water drains, on the principle of the Roman Car dyke, and improved the outfall of the river, so that it might the more easily discharge the fen water which flowed or was pumped into it. The Welland or Deeping fens were drained in 1794, 1801, 1824, 1837 and other years. Almost the only portion of the original wild Fens now remaining is Wicken fen, which lies east of the river Cam and south-east of the isle of Ely.

PRESERVATION OF THE RIVERS

The Fen Rivers.—The preservation of the Fens depends in an intimate and essential manner upon the preservation of the rivers, and especially of their banks. The Witham, known originally as the Grant Avon, also called the Lindis by Leyland (*Itinerary*, vol. vii.), and in Jean Ingelow's *High Tide on the Lincolnshire Coast*, is some 80 m. long, and drains an area of 1,079 sq.m. It owes its present condition to engineering works carried out in the years 1762-64, 1865, 1881, and especially in 1880-84. In 1500 the river was dammed immediately above Boston by a large sluice, the effect of which was not only to hinder free navigation up to Lincoln (to which city sea-going vessels used to penetrate in the 14th and 15th centuries), but also to choke the channel below Boston with sedimentary matter. The sluice, or rather a new structure made in 1764-66, remains; but the river below Boston has been materially improved (1880-84), first by the construction of a new outfall, 3 m. in length, whereby the channel was not only straightened, but its current carried directly into deep water, without having to battle against the often shifting sandbanks of the Wash; and secondly, by the deepening and regulation of the river-bed up to Boston. The Welland, which is about 70 m. long, and drains an area of 760 sq.m., was made to assume its present shape and direction in 1620, 1638, 1650, 1794 and 1835 and following years. The most radical alteration took place in 1794, when a new outfall was made from the confluence of the Glen (30 m. long) to the Wash, a distance of nearly 3 m. The Nene, 90 m. long, and draining an area of some 1,077 sq.m., was first regulated by Bishop Morton, and it was further improved in 1631, 1721, and especially, under plans by Rennie and Telford, in 1827-30 and 1832. The work done from 1721 onward consisted in straightening the lower reaches of the stream and in directing and deepening the outfall. The Ouse (*q.v.*)

or Great Ouse, the largest of the fenland rivers, seems to have been deflected, at some unknown period, from a former channel connecting via the Old Croft river with the Nene, into the Little Ouse below Littleport; and the courses of the two streams are now linked together by an elaborate network of artificial drains, the results of the great engineering works carried out in the Bedford level in the 17th century. The old channel, starting from Earith, and known as the Old West water, carries only a small stream until, at a point above Ely, it joins the Cam. The salient features of the plan executed by Vermuyden for the earl of Bedford in the years 1632-53 were as follows: taking the division of the area made in 1697-98 into (i.) the North level, between the river Welland and the river Nene; (ii.) the Middle level, between the Nene and the Old Bedford river (which was made at this time, *i.e.*, 1630); and (iii.) the South level, from the Old Bedford river to the south-eastern border of the fenland. In the North level the Welland was embanked, the New South Eau, Peakirk drain, and Shire drain made, and the existing main drains deepened and regulated. In the Middle level the Nene was embanked from Peterborough to Guyhirn, also the Ouse from Earith to Over, both places at the south-west edge of the fenland; the New Bedford river was made from Earith to Denver, and the north side of the Old Bedford river and the south side of the New Bedford river were embanked, a long narrow "wash," or overflow basin, being left between them; several large feeding-drains were dug, including the Forty-Foot or Vermuyden's drain, the Sixteen Foot river, Beville's river, and the Twenty Foot river; and a new outfall was made for the Nene, and Denver sluice (to dam the old circuitous Ouse) constructed. In the South level Sam's cut was dug and the rivers were embanked. Since that period the mouth of the Ouse has been straightened above and below King's Lynn (1795-1821), a new straight cut made between Ely and Littleport, the North Level Main drain and the Middle Level drain constructed, and the meres of Ramsey, Whittlesey (1851-52), etc., drained and brought under cultivation. A considerable barge traffic is maintained on the Ouse below St. Ives, on the Cam up to Cambridge, the Lark and Little Ouse, and the network of navigable cuts between the New Bedford river and Peterborough. The Nene, though locked up to Northampton, and connected from that point with the Grand Junction canal, is practically unused above Wansford, and traffic is small except below Wisbech.

The effect of the drainage schemes has been to lower the level of the fenlands generally by some 18 in., owing to the shrinkage of the peat consequent upon the extraction of so much of its contained water; and this again has tended, on the one hand, to diminish the speed and erosive power of the fenland rivers, and, on the other, to choke up their respective outfalls with the sedimentary matters which they themselves sluggishly roll seawards. **The Wash.**—From this it will be plain that the Wash (*q.v.*) is being silted up by riverine detritus. The formation of new dry land, known at first as "marsh," goes on, however, but slowly. During the centuries since the Romans are believed to have constructed the sea-banks which shut out the ocean, it is computed that an area of not more than 60,000 to 70,000 ac. has been won from the Wash, embanked, drained and brought more or less under cultivation. The greatest gain has been at the direct head of the bay, between the Welland and the Great Ouse, where the average annual accretion is estimated at 10 to 11 lineal feet. On the Lincolnshire coast, farther north, the average annual gain has been not quite 2 ft.; whilst on the opposite Norfolk coast it has been little more than 6 in. annually. On the whole, some 35,000 ac. were enclosed in the 17th century, about 19,000 ac. during the 18th, and about 10,000 ac. during the 19th century.

Previous to the drainage of the Fens, ague, rheumatism and other ailments incidental to a damp climate were widely prevalent, but at the present day the Fen country is as healthy as the rest of England; indeed, there is reason to believe that it is conducive to longevity.

Historical Notes.—The earliest inhabitants of this region of whom we have record were the British tribes of the Icenii confederation; the Romans, who subdued them, called them Coritani.

In Saxon times the inhabitants of the Fens were known (*e.g.*, to Bede) as Gyrvii, and are described as traversing the country on stilts. In the end of the 18th century those who dwelt in the remoter parts were scarcely more civilized, being known to their neighbours by the expressive term of "Slodgers." These rude fen-dwellers have in all ages been animated by a tenacious love of liberty. Boadicea, queen of the Icenii; Hereward the Saxon, who defied William the Conqueror; Cromwell and his Ironsides, are representative of the fenman's spirit at its best. The fen peasantry showed a stubborn defence of their rights, not only when they resisted the encroachments and selfish appropriations of the "adventurers" in the 17th century, but also in the Peasants' Rising of 1381, and in the Pilgrimage of Grace in the reign of Henry VIII. So long as the Fens were unenclosed and thickly studded with immense "forests" of reeds, and innumerable marshy pools and "rows" (channels connecting the pools), they abounded in wild fowl, being regularly frequented by various species of wild duck and geese, godwits, cranes, bitterns, herons, swans, ruffs and reeves. Vast numbers of these were taken in decoys (for descriptions of these see Oldfield, Appendix, pp. 2-4, of *A Topographical and Historical Account of Wainfleet* [London, 1829]; and Miller and Skerchly, *The Fenland*, pp. 369-375) and sent to the London markets. At the same time equally vast quantities of tame geese were reared in the Fens, and driven by road to London to be killed at Michaelmas. The waters, too, abounded in fresh-water fish, especially pike, perch, bream, tench, roach, eels and sticklebacks. The soil of the reclaimed Fens is of exceptional fertility, being almost everywhere rich in humus, which is capable not only of producing very heavy crops of wheat and other corn, but also of fattening live-stock with peculiar ease. Of the crops peculiar to the region it must suffice to mention the old British dye-plant woad, which is still grown on a small scale in two or three parishes immediately south of Boston; hemp, which was extensively grown in the 18th century, but is not now planted; and peppermint, which is occasionally grown, *e.g.*, at Deeping and Wisbech. In the second half of the 19th century the Fen country acquired a certain celebrity in the world of sport from the encouragement it gave to speed skating. Whenever practicable, championship and other racing meetings are held, chiefly at Littleport and Spalding. The little village of Welney, between Ely and Wisbech, has produced some of the most notable of the typical Fen skaters, *e.g.*, "Turkey" Smart and "Fish" Smart.

Apart from fragmentary ruins of the former monastic buildings of Crowland, Kirkstead and other places, the Fen country is especially remarkable for the size and beauty of its parish churches, mostly built of Barnack rag from Northamptonshire. While in the possession of such buildings as Ely cathedral and the parish church of Walpole St. Peter's—the finest specimen of Perpendicular architecture in Britain—other districts must be considered equally rich in ecclesiastical architecture. Using these fine opportunities, the Fen folk have for many years cultivated the science of campanology.

Dialect.—Owing to the comparative remoteness of their geographical situation, and the relatively late period at which the Fens were definitely enclosed, the Fenmen have preserved several dialectal features of a distinctive character, not the least interesting being their close kinship with the classical English of the present day. E. E. Freeman (*Longman's Magazine*, 1875) reminded modern Englishmen that it was a native of the Fens, "a Bourne man, who gave the English language its present shape." This was Robert Manning, or Robert of Brunne, who in or about 1303 wrote *The Handlyng Synne*.

FENTON, EDWARD (d. 1603), English navigator, son of Henry Fenton and brother of Sir Geoffrey Fenton (q.v.), was born in Nottinghamshire. In 1577 he sailed, in command of the "Gabriel," with Frobisher's second expedition for the discovery of the north-west passage, and in 1578 he was second in command in Frobisher's third expedition, in the "Judith." In 1582 he was put in charge of an expedition which was to sail round the Cape of Good Hope to the Moluccas and China, and to obtain any knowledge of the north-west passage that was possible without hindrance to his trade. The voyage was a failure. He spent his time quarrelling with his officers, and only reached Brazil. In 1588 he had command of the "Mary Rose," one of the ships of the fleet that was formed to oppose the Armada. He died 15 years later. (See Hakluyt's *Voyages*, Vol. iv.)

FENTON, ELIJAH (1683-1730), English poet, was born at Shelton, near Newcastle-under-Lyme. He graduated from Jesus college, Cambridge, in 1704, and became a schoolmaster. Fenton is remembered as the coadjutor of Alexander Pope in his translation of the *Odyssey*. He was responsible for the first, fourth, 19th and 20th books, for which he received £300. He produced an edition of Milton, with a life (1725), which went through an amazing number of editions; also one of Waller (1729). Other works of his were *Oxford and Cambridge Miscellany Poems* (1707), *Miscellaneous Poems* (1717), and *Mariamne*, a tragedy (1723). He died at East Hampstead, Berkshire, on July 16, 1730. He was buried in the parish church and his epitaph was written by Pope.

See W. W. Lloyd, *Elijah Fenton, his Poetry and Friends* (1894); W. H. Hulme, *Two Early Lives of Milton* (1924).

FENTON, SIR GEOFFREY (c. 1539-1608), English writer and politician, was the son of Henry Fenton, of Nottinghamshire. He was brother of Edward Fenton the navigator. He is said to have visited Spain and Italy in his youth; possibly he went to Paris in Sir Thomas Hoby's train in 1566, for he was living there in 1567, when he wrote *Certaine tragicall discourses written oute of Frenche and Latin*, a free translation of François de Belleforest's French rendering of Matteo Bandello's *Novelle*. Fenton's other works are as follows: *Monophylo* (1572), *Golden Epistles gathered out of Guevarae's workes as other authors . . .* (1575), *Historie of Guicciardini, translated out of French by G. F.* (1579), and a number of Protestant tracts. Through Lord Burghley he obtained, in 1580, the post of secretary to the new lord deputy of Ireland, Lord Grey de Wilton. He held the secretaryship until the end of his life by the favour of Elizabeth, whom he kept informed of the activities of her other servants in Ireland. Under James I. he had to share the post with Sir Richard Coke. Fenton died in Dublin on Oct. 19, 1608, and was buried in St. Patrick's cathedral. He had two children, a son, Sir William Fenton, and a daughter, Catherine, who in 1603 married Richard Boyle, 1st earl of Cork.

(particularly Hatfield collection); *Calendar of State papers, Ireland* (very full), domestic, *Carew papers*; *Lismore papers*, ed. A. B. Grosart (1886-1888); *Certaine tragicall Discourses*, ed. R. L. Douglas (2 vols., 1898), Tudor Translation series, vols. xix., xx. (introd.).

FENTON, LAVINIA (1708-1760), English actress, was probably the daughter of a naval lieutenant named Beswick, but she bore the name of her mother's husband. Her first appearance was as Monimia in Otway's *Orphans*, in 1726 at the Haymarket. She then joined the company of players at the theatre in Lincoln's Inn Fields. She made her greatest success as Polly Peachum in *The Beggar's Opera*. Hogarth's picture shows her in one of the scenes, with the duke of Bolton in a box. She ran away with Charles Paulet, 3rd duke of Bolton, a man much older than herself, who, after the death of his wife in 1751, married her. She died on Jan. 24, 1760.

See C. E. Pearce, *Polly Peachum* (1913).

FENTON, parish; Stoke-on-Trent county, municipal and parliamentary borough, Staffordshire, England. Pop. (1921) 26,714. In 1910 it amalgamated with neighbouring towns to form the municipal borough of Stoke-on-Trent (q.v.) which in 1925 became a city.

FENUGREEK, in botany, *Trigonella Foenum-graecum* (so called from the name given to it by the ancients, who used it as fodder for cattle), a leguminous herb similar in habit and in most characters to species of *Medicago*. The leaves are formed of three obovate leaflets, the middle one of which is stalked; the flowers are solitary, or in clusters of two or three, and have a campanulate, 5-cleft calyx. The pods are many-seeded, cylindrical or flattened, and straight or only slightly curved. Fenugreek is indigenous to south-eastern Europe and western Asia, and is cultivated in the Mediterranean region, parts of central Europe, in Morocco, and largely in Egypt and in India. It bears a sickle-shaped pod, containing from 10 to 20 seeds, from which 6% of a foetid, fatty and bitter oil can be extracted by ether. In India the fresh plant is employed as an esculent. The seed is an ingredient in curry powders, and is used for flavouring cattle foods.

FENWICK, ETHEL GORDON (Mrs. Bedford Fenwick) (1857-), English nurse and journalist, was born at Spynie House, Morayshire, on Jan. 26, 1857. In 1881 she was appointed matron of St. Bartholomew's hospital, London. She married a gynaecologist, Dr. Bedford Fenwick, and devoted herself to the work of organizing and raising the status of the nursing profession by State registration. An act of Parliament for this purpose was passed in 1919. Mrs. Fenwick became, in 1893, honorary editor of *The British Journal of Nursing*, and was a prominent member of the Society of Women Journalists. She founded the Royal British Nurses' Association in 1887, the International Council of Nurses in 1899, and was president of the National Council of Nurses of Great Britain, a constituent part of the International Council. Mrs. Fenwick was also president of the British College of Nurses.

FENWICK, SIR JOHN (c. 1645-1697), English conspirator, son of Sir William Fenwick, was a strong partisan of King James II., and on the accession of William III. began at once to plot against the new king, for which he underwent a short imprisonment in 1689. He publicly insulted Queen Mary in 1691, and it is practically certain that he was implicated in the schemes for assassinating William which came to light in 1695 and 1696. After the seizure of his fellow-conspirators, Robert Charnock and others, he went into hiding, but was arrested in June, 1696. To save himself he offered to reveal all he knew about the Jacobite conspiracies; but his confession was a farce, being confined to charges against some of the leading Whig noblemen, which were damaging, but not conclusive. Sufficient evidence of treason was doubtful, but the Whigs secured the passage through parliament of a bill of attainder. Fenwick was beheaded in London on Jan. 28, 1697.

FEOFFMENT, in English law, during the feudal period, the usual method of granting or conveying a freehold or fee (see FEEF and FEE). The essential elements were *livery of seisin* (delivery of possession), which consisted in formally giving to the feoffee on the land a clod or turf, or a growing twig, as a symbol of the transfer of the land, and words by the feoffor declaratory of his intent to deliver possession to the feoffee with a "limitation" of the estate intended to be transferred. This was called *livery in deed*. *Livery in law* was made not on but in sight of this land, the feoffor saying to the feoffee, "I give you that land; enter and take possession." *Livery in law*, in order to pass the estate, had to be perfected by entry by the feoffee during the joint lives of himself and the feoffor. It was usual to evidence the feoffment by writing in a charter or deed of feoffment; but writing was not essential until the Statute of Frauds. By the Real Property Act 1845 all corporeal hereditaments were declared to be *in grant* as well as *livery*, i.e., they could be granted by deed without livery. (See REAL PROPERTY.)

FERAE NATURAE, the name given to wild, as distinguished from domestic animals, including game, deer, etc. which are not regarded as legal property unless confined. A person having such in his possession is responsible for any damage caused by them. Certain rights may be obtained by the owner of the property if the animals habitually resort to his land, as well as the privilege of hunting them. See GAME LAWS.

FER-DE-LANCE (*Lachesis lanceolatus*), a poisonous American snake allied to the copperhead and bushmaster (*qq.v.*). Reaching a length of 7 ft. it resembles a rattlesnake (*q.v.*) in appearance, but without the "rattle" of the latter, and is found almost throughout Central and South America. Its bite is usually fatal. The fer-de-lance feeds on rats and other small animals.

FERDINAND, a name borne at various times by European sovereigns and princes (Span. *Fernando* or *Hernando*; Ital. *Ferdinando* or *Ferrante*; in O.H.G. *Herinand*, "brave in the host").

FERDINAND (1577-1650), elector and archbishop of Cologne, son of William V., duke of Bavaria, was born on Oct. 7, 1577. He was educated by the Jesuits at the university of Ingolstadt, and in 1595 became coadjutor archbishop of Cologne. He became elector and archbishop in 1612 on the death of his uncle Ernest, whom he also succeeded as bishop of Liège, Munster and Hildesheim. He supported the league founded by his brother Maximilian I., duke of Bavaria, and wished to involve the leagueurs in a general attack on the Protestants of north Germany. The duke refused to accede to his brother's wish; but, in spite of these temporary differences, Ferdinand sent troops and money to the assistance of the league when the Thirty Years' War broke out in 1619. In 1647 he joined his brother Maximilian in concluding an armistice with France and Sweden at Ulm. Ferdinand came into conflict with the citizens of Liège; and when the peace of Westphalia freed him from his enemies, he was able to crush the citizens and deprive them of many privileges. Ferdinand died at Arnsberg on Sept. 13, 1650, and was buried in the cathedral at Cologne.

FERDINAND I. (1793-1875), emperor of Austria, eldest son of Francis I. and of Maria Theresa of Naples, was born at Vienna on April 19, 1793. In his boyhood he suffered from epileptic fits, but as his health improved he was not excluded from the succession. In 1830 his father caused him to be crowned king of Hungary. In 1831 he was married to Anna, daughter of Victor Emmanuel I. of Sardinia. The marriage was barren. When Francis I. died on the 2nd of March 1835, Ferdinand was recognized as his successor, but his incapacity was so notorious that the conduct of affairs was entrusted to a council of state, consisting of Prince Metternich (*q.v.*) with other ministers, and two archdukes, Louis and Francis Charles. They composed the *Staatsconferenz*, the ill-constructed and informal regency which led the Austrian dominions to the revolutionary outbreaks of 1846-49. (See AUSTRIA-HUNGARY.) The emperor, who was subject to fits of actual insanity, and in his lucid intervals was weak and confused in mind, was a political nullity. His popular name of *Der Gütige* (the kindly man) expressed as much derision as affection. Ferdinand had artistic and musical taste. In the presence of the revolutionary troubles, which began with agrarian riots in Galicia in 1846, and then spread over the whole empire, he was helpless. He was compelled to escape from the disorders of Vienna to Innsbruck on May 17, 1848. He came back on the invitation of the diet on Aug. 12, but soon had to escape once more from the mob of students and workmen who were in possession of the city. On Dec. 2 he abdicated at Olmütz in favour of his nephew, Francis Joseph. He lived under the supervision of doctors and guardians at Prague till his death on June 29, 1875.

See Krones von Marchland, *Grundriss der oesterreichischen Geschichte* (Vienna, 1882), which gives an ample bibliography.

FERDINAND I. (1503-1564), Roman emperor, was born at Alcalá de Henares on March 10, 1503, his father being Philip the Handsome, son of the emperor Maximilian I., and his mother Joanna, princess of Castile and Aragon. In April 1521 the emperor granted to him the archduchies and duchies of upper and lower Austria, Carinthia, Styria and Carniola, adding soon afterwards the county of Tirol and the hereditary possessions of the Habsburgs in south-western Germany. About the same time Ferdinand was appointed to govern the duchy of Württemberg, which had come into the possession of Charles V.; and in May 1521 he was married at Linz to Anna (d. 1547), a daughter of Ladislaus, king of Hungary and Bohemia. In 1521 also he was made president of the council of regency (*Reichs-regiment*), appointed to govern Germany during the emperor's absences, and the next five years

were occupied with imperial business, in which he acted as his brother's representative, and in the government of the Austrian lands.

In Austria and the neighbouring duchies Ferdinand sought at first to suppress the reformers and their teaching, a policy which increased his difficulties in quelling risings in the districts under his rule after the Peasant's War broke out in 1524. In August 1526 his childless brother-in-law, Louis II., king of Hungary and Bohemia, was killed at the battle of Mohacs, and the archduke at once claimed both kingdoms, both by treaty and by right of his wife. He was chosen king of Bohemia in October 1526, and crowned at Prague in the following February. But in Hungary John Zapolya, supported by the national party and soon afterwards by the Turks, offered a sturdy resistance. Although Ferdinand was chosen king at Pressburg in December 1526, and after defeating Zapolya at Tokay was crowned at Stuhlweissenburg in November 1527, he was unable to take possession of the kingdom. The Bavarian Wittelsbachs, incensed at not securing the Bohemian throne, were secretly intriguing with his foes; the French, after assisting spasmodically, made a formal alliance with Turkey in 1535; and Zapolya was a very useful centre for the enemies of the Habsburgs. A truce made in 1533 was soon broken, and the war dragged on until 1538, when by the treaty of Grosswardein, Hungary was divided between the claimants. The kingly title was given to Zapolya, but Ferdinand was to succeed. Meanwhile, in January 1531, he had been chosen king of the Romans, or German king, at Cologne. He had earned this honour by his loyalty to his brother, Charles V., whom he had represented at several diets. In religious matters the king was now inclined to steer a middle course, and in 1532 he agreed to the religious peace of Nuremberg, receiving in return from the Protestants some assistance for the war against the Turks. In 1534, however, Philip, landgrave of Hesse, and his associates had succeeded in conquering Württemberg on behalf of its exiled duke, Ulrich (*q.v.*), and neither Charles nor Ferdinand could send much help to their lieutenants. They were consequently obliged to consent to the treaty of Cadan, made in June 1534, by which the German king recognized Ulrich as duke of Württemberg though under Austrian suzerainty.

In Hungary the peace of 1538 was not permanent. When Zapolya died in July 1540 a powerful faction refused to admit Ferdinand's right of succession, and put forward Zapolya's young son John Sigismund as a candidate. The cause of John Sigismund was espoused by the Turks and by Ferdinand's other enemies. The king repeatedly sought to make peace with the sultan, but his envoys were haughtily repulsed. In 1544, however, a short truce was made. This was followed by others, and in 1547 one was concluded for five years, but only on condition that Ferdinand paid tribute for the small part of Hungary which remained in his hands. The struggle was renewed in 1551 and was continued in the same desultory fashion until 1562, when a truce was made which lasted during the remainder of Ferdinand's lifetime. During the war of the league of Schmalkalden in 1546 and 1547 the king had taken the field primarily to protect Bohemia, and after the conclusion of the war he put down a rising in this country with some rigour. About 1546 he began to take up a more independent position in imperial politics. Although Charles had crushed the league of Schmalkalden he had refused to restore Württemberg to Ferdinand; and he gave further offence by seeking to secure the succession of his son Philip, afterwards king of Spain, to the imperial throne. In 1551 Ferdinand agreed that Philip should be his own successor. Events caused these plans to be dropped, but there was a rift between the brothers. During the short war between the emperor and Maurice, elector of Saxony, in 1552 Ferdinand's attitude was lukewarm. He negotiated the treaty of Passau with Maurice in 1552, and in 1555 after the conduct of imperial business had virtually been made over to him, and harmony had been restored between the brothers, he was responsible for the religious peace of Augsburg. Early in 1558 Charles abdicated and on March 24, Ferdinand was crowned at Frankfort. The emperor's short reign was mainly spent in seeking to settle the religious differences of Germany, and in efforts to prosecute the Turkish war

more vigorously. Although he held firmly to the Roman Catholic Church he sought to obtain tangible concessions to her opponents; but he refused to conciliate the Protestants by abrogating the clause concerning ecclesiastical reservation in the peace of Augsburg, and all his efforts to bring about reunion were futile, though he secured the privilege of communion in both kinds from Pius IV. for the laity in Bohemia and in various parts of Germany. In November 1562 he obtained the election of his son Maximilian as king of the Romans, and died in Vienna on July 25, 1564. His family had consisted of six sons and nine daughters.

Ferdinand sought to consolidate his Austrian lands, reformed the monetary system in Germany, and reorganized the Aulic council (*Reichshofrat*). Less masterful but more popular than his brother, whose character overshadows his own, he was just and tolerant, a good Catholic and a conscientious ruler.

Oberleitner, *Österreichs Finanzen und Kriegswesen unter Ferdinand I.* (Vienna, 1859); E. Rosenthal, *Die Behördenorganisation Kaiser Ferdinands, I.* (Vienna, 1887); and W. Bauer, *Die Anfänge Ferdinands I.* (Vienna, 1907).

FERDINAND II. (1578-1637), Roman emperor, was the eldest son of Charles, archduke of Styria (d. 1590), and a grandson of the emperor Ferdinand I. Born at Gratz on July 9, 1578, he was trained by the Jesuits, finishing his education at the university of Ingolstadt, and became the pattern prince of the counter-reformation. In 1596 he undertook the government of Styria, Carinthia and Carniola, and after a visit to Italy began an organized attack on Protestantism which under his father's rule had made great progress in these archduchies. About 1615 it was agreed that Ferdinand, who already had two sons by his marriage with his cousin Maria Anna (d. 1616), daughter of William V., duke of Bavaria, should succeed Matthias in the elective kingdoms of Hungary and Bohemia and should be the next German emperor. (See HABSBURG: *Genealogy*.) The elder archdukes renounced their rights in the succession; the claims of Philip III. and the Spanish Habsburgs were bought off by a promise of Alsace; and the emperor consented to his supersession during his lifetime in Hungary and Bohemia. In 1617 Ferdinand, who was just concluding a war with Venice, was chosen king of Bohemia, and in 1618 king of Hungary; but his election as German king, or king of the Romans, delayed owing to the anxiety of Melchior Klesl (*q.v.*) to conciliate the Protestant princes, had not been accomplished when Matthias died in March 1619. Before this event, however, an important movement had begun in Bohemia. The Bohemian Protestants suddenly realized that their religious, and possibly their civil liberties, were seriously menaced by the choice of Ferdinand as king. They declared Ferdinand deposed, and elected the elector palatine of the Rhine, Frederick V., in his stead; and the struggle between the rivals was the beginning of the Thirty Years' War. At the same time Bethlen Gabor, prince of Transylvania, invaded Hungary, while the Austrians rose and joined the Bohemians; but having seen his foes retreat from Vienna, Ferdinand hurried to Frankfort, where he was chosen emperor on Aug. 28, 1619.

To deal with the elector palatine and his allies the new emperor allied himself with Maximilian I., duke of Bavaria, and the Catholic League, who drove Frederick from Bohemia in 1620, while Ferdinand's Spanish allies devastated the Palatinate. Peace having been made with Bethlen Gabor in December 1621, the emperor could turn his attention to crushing the Protestants. In 1623 the Protestant clergy were expelled from Bohemia; in 1624 all worship save that of the Roman Catholic church was forbidden; and in 1627 an order of banishment against all Protestants was issued. A new constitution made the kingdom hereditary in the house of Habsburg, gave larger powers to the sovereign, and aimed at destroying Bohemian nationality. A fresh rising in Austria was put down by the aid of the Bavarians in 1627, and Ferdinand could fairly claim that in his hereditary lands at least he had rendered Protestantism innocuous.

The renewal of the Thirty Years' War in 1625 was caused mainly by the emperor's vigorous championship of the cause of the counter-reformation in northern and north-eastern Germany.

(See THIRTY YEARS' WAR.) In March 1629 Ferdinand and his advisers felt themselves strong enough to take the important step towards which their policy in the Empire had been steadily tending. Issuing the famous edict of restitution, the emperor ordered that all lands which had been secularized since 1552, the date of the peace of Passau, should be restored to the church, and prompt measures were taken to enforce this decree. The result was the outbreak of the third period of the war. The comparative failure of the imperial arms was due, in the initial stages of the campaign, to Ferdinand's weakness in assenting in 1630 to the demand of Maximilian of Bavaria that Wallenstein should be deprived of his command; and also to the genius of Gustavus Adolphus; and in its later stages to his insistence on the second removal of Wallenstein, and to his complicity in the assassination of the general (see WALLENSTEIN). The peace of Prague, concluded in 1635, marks the definite failure of Ferdinand to crush Protestantism in the Empire, as he had already done in Austria and Bohemia. The emperor, however, refused to allow the inhabitants of his hereditary dominions to share in the benefits of the peace. During these years Ferdinand had also been menaced by the secret or open hostility of France. The last important act of the emperor was to secure in 1636 the election of his son Ferdinand as king of the Romans. A few weeks afterwards, on Feb. 15, 1637, the emperor died at Vienna, leaving, in addition to the king of the Romans, a son Leopold William (1614-1662), bishop of Passau and Strasbourg.

Khevenhüller, *Annales Ferdinandeae* (Regensburg, 1640-1646); F. van Hurter, *Geschichte Kaiser Ferdinands II.* (Schaffhausen, 1850-1855); *Korrespondenz Kaiser Ferdinands II. mit P. Becanus und P. W. Lamormaini*, edited by B. Dudik (Vienna, 1848 fol.); Raffaele de Cesare, *La fine di un regno* (1908-09). See also bibliography under THIRTY YEARS' WAR.

FERDINAND III. (1608-1657), Roman emperor, was the elder son of the emperor Ferdinand II., and was born at Gratz on July 13, 1608. Educated by the Jesuits, he was crowned king of Hungary in December 1625, and king of Bohemia two years later, and soon began to take part in imperial business. Wallenstein, however, refused to allow him to hold a command in the imperial army. The young king was appointed the successor of the famous general when he was deposed in 1634; and as commander-in-chief of the imperial troops, he was nominally responsible for the capture of Regensburg and Donauwörth, and the defeat of the Swedes at Nördlingen. Having been elected king of the Romans, or German king, at Regensburg in Dec. 1636, Ferdinand became emperor on his father's death in the following February, and showed himself anxious to put an end to the Thirty Years' War. But he was reluctant to grant religious liberty to the Protestants, and anxious to act in unison with Spain. In 1640 he had refused to entertain the idea of a general amnesty suggested by the diet at Regensburg; but in 1648 he assented to the treaty of Westphalia (*q.v.*). Owing to Ferdinand's insistence the Protestants in his hereditary dominions did not obtain religious liberty at this settlement. After 1648 the emperor was engaged in carrying out the terms of the treaty and ridding Germany of the foreign soldiery. In 1656 he sent an army into Italy to assist Spain in her struggle with France, and he had just concluded an alliance with Poland to check the aggressions of Charles X. of Sweden when he died on April 2, 1657. Ferdinand was a scholarly and cultured man, an excellent linguist and a composer of music. His first wife was Maria Anna (d. 1646), daughter of Philip III. of Spain, by whom he had three sons: Ferdinand, who was chosen king of the Romans in 1653, and who died in the following year; Leopold, who succeeded his father on the imperial throne; and Charles Joseph (d. 1664), bishop of Passau and Breslau, and grand-master of the Teutonic order. The emperor's second wife was his cousin Maria (d. 1649), daughter of the archduke Leopold; and his third wife was Eleanora of Mantua (d. 1686). His musical works, together with those of the emperors Leopold I. and Joseph I., have been published by G. Adler (Vienna, 1892-1893).

See M. Koch, *Geschichte des deutschen Reiches unter der Regierung Ferdinands III.* (Vienna, 2 vols., 1865-66).

FERDINAND I. (1373–1416), king of Aragon, called “of Antequera,” was the son of John I. of Castile by his wife Eleanor, daughter of the third marriage of Peter IV. of Aragon. As infant of Castile Ferdinand had played an honourable part. When his brother Henry III. died at Toledo, in 1406, the cortes was sitting, and the nobles offered to make him king in preference to his nephew John. Ferdinand declined. As co-regent of the kingdom with Catherine, widow of Henry III. and daughter of John of Gaunt by his marriage with Constance, daughter of Peter the Cruel, Ferdinand proved a good ruler. As king of Aragon his short reign of two years left him little time to make his mark. Having been bred in Castile, where the royal authority was, at least in theory, absolute, he showed himself impatient under the checks imposed on him by the *fueros*, the chartered rights of Aragon and Catalonia. His most signal act as king was to aid in closing the Great Schism in the Church by agreeing to the deposition of the antipope Benedict XIV., an Aragonese. He died at Ygualada in Catalonia on April 2, 1416.

FERDINAND, MAXIMILIAN KARL LEOPOLD MARIA (1861–), king of Bulgaria, fifth and youngest son of Prince Augustus of Saxe-Coburg and Gotha, was born on Feb. 26, 1861. In 1879 he travelled with his brother Augustus to Brazil, and the results of their botanical observations were published at Vienna, 1883–1888, under the title of *Itinera Principum S. Coburgi*. Ferdinand was a lieutenant in an Austrian hussar regiment when he was elected prince of Bulgaria, on July 7, 1887, in succession to Prince Alexander, who had abdicated in 1886. He assumed the government on Aug. 14, 1887, but Russia for a long time refused to acknowledge the election, and he was accordingly exposed to frequent military conspiracies, connived at by the Russian Government. The firmness and vigour with which he met all attempts at revolution were at length rewarded, and his election was confirmed in March 1896 by the Porte and the Great Powers. On April 20, 1893 he married Marie Louise de Bourbon (d. 1899), eldest daughter of Duke Robert of Parma. The prince adhered to the Roman Catholic faith in which he had been brought up, but his son and heir, the young Prince Boris, was received into the Orthodox Greek Church on Feb. 14, 1896 with the Tsar, Nicholas II., as godfather. This event marked a real *rapprochement* with Russia. In 1908 Ferdinand married Eleanor (b. 1860), a princess of the house of Reuss. Later in the year, in connection with the Austrian annexation of Bosnia-Herzegovina and the crisis with Turkey, he proclaimed the independence of Bulgaria, and took the title of king or tsar. (See BULGARIA, and EUROPE: History.)

King Ferdinand in 1911 was the instigator of the Balkan league between Bulgaria, Serbia, Greece and Montenegro, which was formed in 1912 and enabled these four states to declare war against Turkey that same year. This pact provided for the future division of the Balkan peninsula, reserving to the arbitration of the emperor of Russia the solution of any doubtful claims. The war started in Oct. 1912, before the conclusion of the Treaty of Ouchy, which put an end to the Italo-Turkish War (Oct. 15). Under the command of King Ferdinand, the Bulgarian army dealt the most rapid and decisive blows to the enemy; victorious on the battlefields of Kirk Kilisse and Lule Burgas, and having conquered most of Macedonia and Thrace, it started on the open road to Constantinople. Europe grew alarmed; the Great Powers brought about the armistice of Dec. 3, 1912, and the London conference, which started on Dec. 13.

These discussions, however, ceased abruptly, and military operations were resumed on Feb. 3, 1913. The Bulgarian armies attacked at Gallipoli and Chatalja, and after a gallant siege entered Adrianople on March 26, 1913. However, the Treaty of London which followed did not sanction these victories, and its decisions instead of inaugurating peace, provoked a war between the Balkan States, which began on June 30, 1913, by a simultaneous attack of the Serbs and Bulgarians. The former allies became bitter rivals, Rumania and Turkey joining Montenegro, Greece and Serbia against Bulgaria, who, finding herself closed in by four enemies at once, was forced after a few weeks of brave but useless resistance, to submit unconditionally to the

victors' terms. The Treaty of Bucharest, signed on Aug. 10, 1913, annihilated in one stroke the brilliant results obtained through the heroism of the Bulgarian armies in 1912–3. It deprived Bulgaria of all her conquests including the town of Silistra and part of the Dobruja and gave to the Serbians and Greeks the province of Macedonia for which Bulgaria had made all the sacrifices of the first Balkan War. This treaty was the principal cause of Bulgaria's participation in the World War on the side of Germany. It explains the resentment of King Ferdinand and his government against the other Balkan States. Had the Allied Powers in 1914 guaranteed the revision of the Treaty of Bucharest, Bulgaria would have co-operated with them; but as they failed to do so, Germany was able, by illusory promises, to induce Bulgaria, who felt she had been unjustly treated, to fight for the German cause. These German manoeuvres did not succeed at once, for King Ferdinand began by proclaiming the neutrality of Bulgaria in Nov. 1914.

During May 1915 the Bulgarian Government sounded the four Great Powers, with regard to the fulfilment of Bulgaria's legitimate claims in Macedonia. As no concrete answer was returned, King Ferdinand turned to Germany, where his application was received with great cordiality. Berlin made lavish promises at once. German envoys hurried to Bulgaria, with a view to persuading the King and the Government to conclude a military alliance with Germany. The desire for revenge against Serbia, Greece and Rumania inspired Ferdinand to bind Bulgaria to the Central Powers. On Sept. 21, 1915 he gave the order for general mobilisation, though his Government advised armed neutrality. In view of this equivocal situation Russia sent an ultimatum to Bulgaria on Oct. 4, 1915, which was succeeded by formal declarations of war against Bulgaria on the part of Serbia, France, Great Britain and Italy. Bulgaria was definitely in the German camp; under General Gekoff, commander-in-chief, her armies were victorious on most of the battlefields of Macedonia, Thrace and Rumania, in 1915, 1916 and 1917, against the Serbs, and against the Rumanians. The Kaiser, the king of Saxony and the king of Württemberg all paid official visits to King Ferdinand at Sofia. However, in Sept. 1918, the Bulgarian army, discouraged by innumerable hardships, was defeated at Dobropole, Macedonia, by the Allied troops. This was the sign for a general retreat. An armistice was signed at Salonika on Sept. 30 which ended the war between Bulgaria and the Allies. After this catastrophe King Ferdinand abdicated in favour of his son Boris on Oct. 4, 1918 and left Sofia the same evening for Coburg where he has lived since in retirement. (A. St.)

FERDINAND I. (1423–1494), also called Don Ferrante, king of Naples, the natural son of Alphonso V. of Aragon and I. of Sicily and Naples, was born in 1423. He succeeded his father on the throne of Naples in 1458, but Pope Calixtus III. declared the line of Aragon extinct and the kingdom a fief of the church. The new pope, Pius II., recognized Ferdinand, but John of Anjou decided to try to regain the throne conquered by his ancestors, and invaded Naples. Ferdinand was severely defeated by the Angevins and the rebels at Sarno in July 1460, but with the help of Alessandro Sforza and of the Albanian chief, Skanderbeg, he re-established (1464) his authority in the kingdom. In 1480 the Turks captured and sacked Otranto, but in the following year it was retaken by Ferdinand's son Alphonso, duke of Calabria. An attempt at revolt on the part of the nobles in 1485 was crushed; many of the nobles, notwithstanding Ferdinand's promise of a general amnesty, were afterwards treacherously murdered at his express command. He died in Jan. 1494.

Alvin, *De gestis regum Neapol. ab Aragonia* (Naples, 1588); S. de Sismondi, *Histoire des républiques italiennes*, vols. v. and vi. (Brussels, 1838); P. Villari, *Machiavelli*, pp. 60–64 (Eng. transl., 1892); for the revolt of the nobles in 1485 see Camillo Porzio, *La Congiura dei Baroni* (first published Rome, 1565; many subsequent editions), written in the Royalist interest.

FERDINAND II. (1469–1496), king of Naples, was the grandson of the preceding, and son of Alphonso II. Alphonso abdicated in his son's favour in 1495, on the approach of Charles

VIII. of France. Ferdinand was unable to defend the city, where there was a strong party hostile to the dynasty. He fled to Ischia; but when the French king left Naples with most of his army, in consequence of the formation of an Italian league against him, he returned and defeated the French garrisons; and the Neapolitans, irritated by the conduct of the French occupation, received him back with enthusiasm. With the aid of the great Spanish general, Gonzalo de Cordova, he drove out the invaders. He died on Sept. 7, 1496.

For authorities see under FERDINAND I. of Naples; for the exploits of Gonzalo de Cordova see H. P. del Pulgar, *Crónica del gran capitano don Gonzalo de Cordoba* (new ed., Madrid, 1834).

FERDINAND IV. (III. of Sicily, and I. of the Two Sicilies) (1751–1825), king of Naples, third son of Don Carlos of Bourbon (afterwards Charles III. of Spain), king of Naples and Sicily, was born in Naples on Jan. 12, 1751. When his father ascended the Spanish throne in 1759, Ferdinand, in accordance with the treaties forbidding the union of the two crowns, succeeded him as king of Naples, under a regency presided over by the Tuscan Bernardo Tanucci, who neglected the young king's education, and left him to indulge in his liking for low life. Ferdinand's minority ended in 1767, and his first act was the expulsion of the Jesuits. In 1768 he married Maria Carolina, daughter of the empress Maria Theresa. The queen secured the dismissal of Tanucci, and with the help of Sir John Acton (*q.v.*), who eventually became prime minister, sought independence of the Spanish connection and a *rapprochement* with England and Austria. From the day of the execution of her sister Marie Antoinette, the queen lived in terror of revolution and Naples joined the coalition against France in 1793. For the history of Ferdinand's intervention in the revolutionary war, the establishment of the Parthenopean republic at Naples, and the savage reaction after the recapture of Naples by the army of brigands and gaol-birds under Cardinal Ruffo, see NAPLES: *History*. Ferdinand had to flee to Sicily in 1806, where he reigned under British protection while Joseph Bonaparte ruled in Naples. Lord Bentinck, the British resident in Sicily, procured the queen's exile to Austria, and Ferdinand allowed his son Francis (afterwards Francis I. of the Two Sicilies) to act as regent in Sicily.

He returned to Naples after the fall of Napoleon, and proclaimed the kingdom of the Two Sicilies. He was now completely subservient to Italy. Ruthless repression of all Liberal opinion favoured the spread of the secret society of the Carbonari (*q.v.*). After the revolt of Gen. Pepe (1820) Ferdinand granted a paper constitution, thus securing the help of his Neapolitan subjects in quelling an insurrection in Sicily. The success of the military revolution in Naples alarmed the Powers of the Holy Alliance. Ferdinand was invited to the congress of Laibach (*q.v.*) to explain the situation. His cynical repudiation at Laibach of the constitution he had granted made conciliation in Naples hopeless. An Austrian army occupied Naples, and Pepe was defeated. The parliament was now dismissed, and Ferdinand inaugurated an era of savage persecution, supported by spies and informers, against the Liberals and Carbonari, the Austrian commandant in vain protesting against the savagery which his presence alone rendered possible.

Ferdinand died on Jan. 4, 1825. Few sovereigns have left behind so odious a memory. His whole career is one long record of perjury, vengeance and meanness, unredeemed by a single generous act, and his wife was a worthy helpmeet and actively co-operated in his tyranny.

BIBLIOGRAPHY.—The standard authority on Ferdinand's reign is Pietro Coletta's *Storia del Reame di Napoli* (2nd ed., Florence, 1848), which, though not free from party passion, is reliable and accurate; L. Conforti, *Napoli nel 1799* (Naples, 1886); G. Pepe, *Memorie* (1847), a most valuable book; C. Auriol, *La France, l'Angleterre, et Naples* (1906); for the Sicilian period and the British occupation, G. Bianco, *La Sicilia durante l'occupazione Inglese* (Palermo, 1902), which contains many new documents of importance; Freiherr A. von Helfert has attempted the impossible task of whitewashing Queen Carolina in his *Königin Karolina von Neapel und Sicilien* (Vienna, 1878) and *Maria Karolina von Oesterreich* (Vienna, 1884); he has also written a useful life of *Fabrizio Ruffo* (Italian ed., Florence, 1885); for the Sicilian revolution of 1820 see G. Bianco's *La Rivoluzione in Sicilia*

del 1820 (Florence, 1905) and M. Amari's *Carteggio* (Turin, 1896). *Lettere di Ferdinando IV.* (1914).

FERDINAND I. (1345–1383), king of Portugal, sometimes referred to as *el Gentil* (the Gentleman), son of Pedro I. of Portugal, was born on Oct. 31, 1345, at Coimbra and succeeded his father in 1367. On the death of Pedro of Castile in 1369, Ferdinand, as great-grandson of Sancho IV. by the female line, became one of the claimants for the throne of Castile (see SPAIN: *History*), thus involving himself in disastrous wars between 1370 and 1382, when peace was made at Badajoz, it being stipulated that Beatrice, the heiress of Ferdinand, should marry King John of Castile, and thus secure the ultimate union of the crowns. Ferdinand left no male issue when he died at Lisbon on Oct. 22, 1383, and the direct Burgundian line, which had been in possession of the throne since Count Henry (about 1112), became extinct.

FERDINAND I. (1865–1927), KING OF RUMANIA, was born Aug. 24, 1865 at Sigmaringen, Prussia, the second son of Prince Leopold of Hohenzollern-Sigmaringen. As Charles I. had no son it was decided that the succession should be continued in the family of Prince Leopold, and Prince Ferdinand, Charles's nephew, became Crown Prince of Rumania and heir presumptive to the Rumanian throne in March, 1889. Prince Ferdinand took a great interest in military questions and organized the Rumanian Army on modern lines. He was commander-in-chief of the Rumanian armies during the Bulgarian campaign of 1913. On Jan. 10, 1893 he married Princess Marie, eldest daughter of the duke of Edinburgh, duke of Saxe-Coburg-Gotha. Six children were born of the marriage.

When Ferdinand ascended the throne on Oct. 11, 1914, he realized that an armed intervention in the cause of Rumania's national unity was unavoidable. A Hohenzollern by birth, he in due course declared war on his native country. As a consequence he was disowned by the Hohenzollern family. When Bucharest was occupied by General Mackensen, King Ferdinand and the Royal family withdrew with the Government and the army into Moldavia. There he endured with the rest of the population a most appalling period of anxiety, sickness and want. The Bolshevik revolution and the collapse of the Russian armies came as a crowning misery. But the Rumanian Army, headed by King Ferdinand, repulsed the German attack at Mărășești, thus saving the rest of the country from invasion. In 1918 the provinces of Bessarabia, Bucovina, Transylvania and the Banat had become united with Rumania, and on Oct. 15, 1922 King Ferdinand was crowned, at Alba Julia, king of all Rumanians.

Two most important reforms, the agrarian reform and the inauguration of universal suffrage, were enacted under Ferdinand's reign. The expropriation of large estates and their conversion into small holdings did much to guarantee the peaceful development of an agricultural country such as Rumania. King Ferdinand was the first landlord to hand over his estates to his peasant-soldiers. It was also due to his initiative that the thorny Jewish question was solved by the grant of full civil and military rights to the Rumanian-born Jews. In Dec. 1925 Ferdinand's eldest son, Charles, renounced his claims to the throne, and Charles's son, Michæl, became heir apparent. Ferdinand died on July 20, 1927 (see also RUMANIA).

FERDINAND I. (d. 1065), *El Magno* or "the Great," king of Castile, son of Sancho III. of Navarre, was put in possession of Castile in 1028, on the murder of the last count, as the heir of his mother Elvira, daughter of a previous count of Castile. He married Sancha, sister and heiress of Bermudo, king of Leon, and on the latter's death in battle at Tamaron (1038) took possession of Leon by right of his wife. He was recognized in Spain as emperor in 1056. The use of the title was resented by the emperor Henry IV. and by Pope Victor II., as implying a claim to the headship of Christendom, and as a usurpation on the Holy Roman empire. It did not, however, mean more than that Spain was independent of the empire, and that the sovereignty of Leon was the chief of the princes of the peninsula. Although Ferdinand had grown in power by a fratricidal strife with Bermudo of Leon, and though in 1054 he defeated and killed his brother Garcia of Navarre at Atapuerca, he was counted a

pious king, on account of his victories over the Mohammedans, with which he began the period of the great reconquest. Ferdinand died on June 24, 1065, in Leon,—having laid aside his crown and royal mantle, dressed in the frock of a monk and lying on a bier, covered with ashes, which was placed before the altar of the church of Saint Isidore. He left three sons, Sancho, Alphonso and Garcia, who divided the kingdom until the murder of Sancho and the imprisonment of Garcia, when Alphonso reigned over the whole as Alphonso VI.

FERDINAND II., king of Leon only (d. 1188), was the second son of Alphonso VII. and of Berenguela, of the house of the counts of Barcelona. On the division of the kingdoms which had obeyed his father (1157), he received Leon, which he ruled for 30 years. During the minority of his nephew Alphonso VIII. of Castile he endeavoured to impose himself on the kingdom as regent. On the west he was in more or less constant strife with Portugal, which was in process of becoming an independent kingdom. He extended his dominions southward in Estremadura at the expense of the Moors.

FERDINAND III. (1199–1252), *El Santo*, or “the Saint,” king of Castile, son of Alphonso IX. of Leon, and of Berengaria, daughter of Alphonso VIII. of Castile, ranks among the greatest of the Spanish kings. The marriage of his parents, who were second cousins, was dissolved as unlawful by the pope, but the legitimacy of the children was recognized. Till 1217 he lived with his father in Leon. In that year the young king of Castile, Henry, was killed by accident. Berengaria renounced the crown in her son's favour. Alphonso of Leon considered himself tricked, and the young king had to begin his reign by a war against his father and a faction of the Castilian nobles. His own ability and the remarkable capacity of his mother proved too much for the king of Leon and his Castilian allies. Ferdinand married Beatrice, daughter of the emperor Philip (of Hohenstaufen), and followed her advice both in prosecuting the war against the Moors and in the steps which she took to secure his peaceful succession to Leon on the death of his father in 1231. After the union of Castile and Leon by law in that year he began the series of campaigns which ended by reducing the Mohammedan dominions in Spain to Granada. Cordova fell in 1236, and Seville in 1248. The king of Granada did homage to Ferdinand, and undertook to attend the cortes when summoned. The king was a severe persecutor of the Albigenses, and his formal canonization by Pope Clement X. in 1671 was due as much to his orthodoxy as to his crusading. He revived the university first founded by his grandfather Alphonso VIII., and placed it at Salamanca. By his second marriage with Joan (d. 1279), daughter of Simon, of Dammartin, count of Ponthieu, by right of his wife Marie, Ferdinand was the father of Eleanor, the wife of Edward I. of England.

FERDINAND IV., *El Emplazado* or “the Summoned,” king of Castile (d. 1312), son of Sancho IV., *El Bravo*, and his wife Maria de Molina, succeeded to the throne when a boy of six. His minority was a time of anarchy. He owed his escape from the violence of competitors and nobles, partly to the tact and courage of his mother, and partly to the citizens of Avila, who gave him refuge within their walls. He died suddenly in his tent at Jaen when preparing for a raid into the Moorish territory of Granada, on Sept. 7, 1312. His only son succeeded him as Alphonso XI.

FERDINAND V. of Castile and Leon, and II. of Aragon (“the Catholic”) (1452–1516), was the son of John I. of Aragon by his second marriage with Joanna Henriquez, of the family of the hereditary grand admirals of Castile, and was born at Sos in Aragon on March 10, 1452. His marriage in 1469 to his cousin Isabella of Castile (heiress of Henry IV. of Castile) was dictated by the desire to unite his own claims to the crown with hers. When the king died in 1474 he made an attempt to procure his own proclamation as king without recognition of the rights of his wife. Isabella asserted her claims firmly, and at all times insisted on a voice in the government of Castile. But though Ferdinand had sought a selfish political advantage at his wife's expense, he was well aware of her ability and high character, and their views in government were identical. The king cared for nothing but dominion and political power, and he played a great part in

Europe. His share in establishing the royal authority in all parts of Spain, in expelling the Moors from Granada, in the conquest of Navarre, in forwarding the voyages of Columbus, and in contending with France for the supremacy in Italy, is dealt with elsewhere (*see SPAIN: History*). His character explains the most ungracious acts of his life, such as his breach of his promises to Columbus, his distrust of Ximenez and of the Great Captain. He feared that Ximenez and the Great Captain would become too independent, and watched them in the interest of the royal authority. He is said to have boasted that he had deceived Louis XII. of France twelve times; it is, in any case, certain that when Ferdinand made a treaty, or came to an understanding with any one, the contract was generally found to contain implied meanings favourable to himself which the other contracting party had not expected. The worst of his character was prominently shown after the death of Isabella in 1504. He claimed the regency of Castile in the name of his insane daughter Joanna, without regard to the claims of her husband Philip of Habsburg. The hostility of the Castilian nobles baffled him for a time, but on Philip's death (1506) he reasserted his authority. His second marriage with Germaine of Foix in 1505 had apparently been contracted in the hope that by securing an heir male he might punish his Habsburg son-in-law. Aragon did not recognize the right of women to reign, and would have been detached together with Catalonia, Valencia and the Italian states if he had had a son. On this occasion Ferdinand allowed passion to obscure his political sense, and lead him into acts which tended to undo his work of national unification. As king of Aragon he abstained from inroads on the liberties of his subjects which might have provoked rebellion. A few acts of illegal violence are recorded of him—as when he caused a notorious demagogue of Saragossa to be executed without form of trial. His arrangement of the convention of Guadalupe, which ended the fierce Agrarian conflicts of Catalonia, was wise and profitable to the country, though it was probably dictated by a wish to weaken the landowners by taking away their feudal rights. Ferdinand died at Madrigalejo in Estremadura on Feb. 23, 1516.

The lives of the kings of this name before Ferdinand V. are contained in the chronicles, and in the *Anales de Aragon* of Zurita, and the *History of Spain* by Mariana. Both deal at length with the life of Ferdinand V.

See W. H. Prescott, *History of the Reign of Ferdinand and Isabella* (1887); J. H. Mariéjol, *L'Espagne sous Ferdinand et Isabelle* (Paris, 1892).

FERDINAND VI., king of Spain (1713–1759), second son of Philip V., founder of the Bourbon dynasty, by his first marriage with Maria Luisa of Savoy, was born at Madrid on Sept. 23, 1713, and succeeded his father in 1746. His father's second wife, Elizabeth Farnese, looked upon her stepson as an obstacle to the fortunes of her own children. The hypochondria of his father left Elizabeth mistress of the palace. Ferdinand was married in 1729 to Maria Magdalena Barbara, daughter of John V. of Portugal. For the events of his reign *see SPAIN: History*, and *ENSENADA, Cenon de Somodevilla*. The death of his wife Barbara broke his heart. Between the date of her death in 1758 and his own on Aug. 10, 1759, he fell into a state of melancholy bordering on madness.

See William Coxe, *Memoirs of the Kings of Spain of the House of Bourbon*, vol. iv. (1815); Count of Fernan Nuñez, *Vida de Carlos III.* ed. Morel Fatio and Don A. Paz y Melia (1898).

FERDINAND VII., king of Spain (1784–1833), eldest son of Charles IV., king of Spain, and of his wife Maria Luisa of Parma, was born at the palace of San Ildefonso near Balsain in the Somosierra hills, on Oct. 14, 1784. On March 17, 1808 he succeeded to the throne by the forced abdication of his father, but was shortly afterwards taken prisoner by Napoleon. He was released in 1814 (*see SPAIN: History*) and returned to find that while Spain was fighting for independence in his name a new world had been born of foreign invasion and domestic revolution. He came back to assert the ancient doctrine that the sovereign authority resided in his person only, and repudiated the impracticable constitution made by the cortes in 1814 without his consent. He proved himself, however, incapable of governing or of

choosing reliable advisers, and was influenced by the lowest intriguers. The autocratic powers of the Grand Alliance, though forced to support him as the representative of legitimacy in Spain, watched his proceedings with disgust and alarm. When the inevitable revolt came in 1820 he grovelled to the insurgents as he had done to his parents and was imprisoned by them until 1823. On the invasion by France in that year the revolutionary party carried Ferdinand to Cadiz, and he continued to make promises of amendment till he was free. Then, in violation of his oath to grant an amnesty, he revenged himself for three years of coercion by killing on a scale which revolted his "rescuers" and against which the duke of Angoulême, powerless to interfere, protested by refusing the Spanish decorations offered him for his services. During his declining years Ferdinand's energy abated. After his fourth marriage in 1829 with Maria Christina of Naples by whom he had two daughters, he was persuaded by his wife to confirm Charles IV.'s revocation of the Salic Law of Philip V., which gave a preference to all the males of the family in Spain. When Ferdinand died at Madrid on Sept. 29, 1833, his daughter Isabella II. was proclaimed queen, and her mother acted as regent.

King Ferdinand VII. kept a diary during the troubled years 1820-23, which has been published by the count de Casa Valencia.

See D. E. de K. Vays, *Historia de la vida y reinado de Ferdinand VII.* 3 vols. (1842) Miñano, *Histoire de la Révolution d'Espagne*, 1820-23 (2 vols., 1824); P. Zancada, *El Sentido Social de la revolución de 1820*. *Revista contemporánea* (1903).

FERDINAND II. (1810-1859), nicknamed King Bomba, king of the Two Sicilies, son of Francis I., was born at Palermo on Jan. 12, 1810. In 1832 he married Cristina, daughter of Victor Emmanuel I., king of Sardinia, and shortly after her death in 1836 he took for a second wife Maria Theresa, daughter of the archduke Charles of Austria. After his Austrian alliance the bonds of despotism were more closely tightened; there were various abortive attempts at insurrection; in 1837 there was a rising in Sicily in consequence of the outbreak of cholera, and in 1843 the Young Italy Society organized a series of isolated outbreaks. The expedition of the Bandiera brothers (*q.v.*) in 1844, was followed by cruel sentences on the rebels. In Jan. 1848 a rising in Sicily was the signal for revolutions all over Italy and Europe; it was followed by a movement in Naples, and the king granted a constitution which he swore to observe. Serious disturbances broke out in the streets of Naples on May 15; the king withdrew his promise and dissolved the national parliament on March 13, 1849. He retired to Gaeta to confer with various deposed despots, and the Austrian victory at Novara (March 1849) strengthened his determination to return to a reactionary policy. Sicily was subjugated by General Filangieri, and the chief cities were bombarded, an expedition which won for Ferdinand the epithet of "King Bomba." In 1851 the political prisoners of Naples were calculated by Mr. Gladstone in his letters to Lord Aberdeen (1851) to number 15,000 (probably the real figure was nearer 40,000), and the scandalous reign of terror, and the abominable treatment of the prisoners led France and England to make diplomatic representations to the king, but without success. An attempt was made by a soldier to assassinate Ferdinand in 1856. He died on May 22, 1859, just after the declaration of war by France and Piedmont against Austria, which was to result in the collapse of his kingdom and his dynasty. He was bigoted, cruel, mean, treacherous, though not without a certain *bonhomie*.

BIBLIOGRAPHY.—See *Correspondence respecting the Affairs of Naples and Sicily, 1848-1849, presented to both Houses of Parliament by Command of Her Majesty*, May 4, 1849; *Two Letters to the Earl of Aberdeen*, by the Right Hon. W. E. Gladstone, 1st ed., 1851 (an edition published in 1852 and the subsequent editions contain an *Examination of the Official Reply of the Neapolitan Government*); N. Nisco, *Ferdinando II. il suo regno* (Naples, 1884); H. Remsen Whitehouse, *The Collapse of the Kingdom of Naples* (1899); R. de Cesare, *La Caduta d'un Regno*, vol. i. (Città di Castello, 1900), which contains a great deal of fresh information, but is badly arranged and not always reliable. See also M. Schipa, *Il regno di Napoli al tempo di Carlo di Borbone* (1904).

FERDINAND III. (1769-1824), grand duke of Tuscany, and archduke of Austria, second son of the emperor Leopold II.,

was born on May 6, 1769. On his father becoming emperor in 1790, he succeeded him as grand duke of Tuscany. Ferdinand was one of the first sovereigns to enter into diplomatic relations with the French republic (1793); and although, a few months later, he was compelled by England and Russia to join the coalition against France, he concluded peace with that power in 1795, and by observing a strict neutrality saved his dominions from invasion by the French, except for a temporary occupation of Livorno, till 1799, when he was compelled to vacate his throne, and a provisional Republican government was established at Florence. Shortly afterwards the French arms suffered severe reverses in Italy, and Ferdinand was restored to his territories; but in 1801, by the peace of Lunéville, Tuscany was converted into the kingdom of Etruria, and he retired to Vienna. He obtained in 1802 the electorship of Salzburg, which he exchanged by the peace of Pressburg in 1805 for that of Würzburg. In 1806 he was admitted as grand duke of Würzburg to the confederation of the Rhine. He was restored to the throne of Tuscany after the abdication of Napoleon in 1814, but had again to vacate his capital for a short time in 1815, when Murat proclaimed war against Austria. After Waterloo he remained in undisturbed possession of his grand duchy. The restoration in Tuscany was not accompanied by the reactionary excesses which characterized it elsewhere, and a large part of the French legislation was retained. His prime minister was Count V. Fossombroni (*q.v.*). The mild rule of Ferdinand, his solicitude for the welfare of his subjects, his enlightened patronage of art and science, his encouragement of commerce, and his toleration render him an honourable exception to the generality of Italian princes of his time. He died in June 1824, and was succeeded by his son Leopold II. (*q.v.*).

FERDINAND, duke of Brunswick (1721-1792), Prussian general field marshal, was the fourth son of Ferdinand Albert, duke of Brunswick, and was born at Wolfenbüttel on Jan. 12, 1721. In his twentieth year he was made chief of a newly-raised Brunswick regiment in the Prussian service. He was present in the battles of Mollwitz and Chotusitz. In succession to Margrave Wilhelm of Brandenburg, killed at Prague (1744), Ferdinand received the command of Frederick the Great's *Leibgarde* battalion, and distinguished himself at Sohr (1745). During the ten years' peace he was in the closest touch with the military work of Frederick the Great, who sought to make the guards battalion a model of the whole Prussian army. Ferdinand became one of the king's most intimate friends. In the first campaign of the Seven Years' War Ferdinand commanded one of the Prussian columns which converged upon Dresden, and in the operations which led up to the surrender of the Saxon army at Pirna (1756), and at the battle of Lobositz, he led the right wing of the Prussian infantry. In 1757 he distinguished himself at Prague, and he served also in the campaign of Rossbach. Shortly after this he was appointed to command the allied forces which were being organized for the war in western Germany. He found this army dejected by a reverse and a capitulation, yet within a week of his taking up the command he assumed the offensive, and thus began the career of victory which made his European reputation as a soldier. His conduct of the five campaigns which followed (see SEVEN YEARS' WAR) was naturally influenced by the teachings of Frederick, whose pupil the duke had been for so many years. Ferdinand, indeed, approximated more closely to Frederick in his method of making war than any other general of the time. Yet his task was in many respects far more difficult than that of the king. Frederick was the absolute master of his own homogeneous army, Ferdinand merely the commander of a group of contingents, and answerable to several princes for the troops placed under his control. In 1758 he fought and won the battle of Crefeld, several marches beyond the Rhine, but so advanced a position he could not well maintain, and he fell back to the

Lippe. He resumed a bold offensive in 1759, only to be repulsed at Bergen (near Frankfurt-on-Main). On Aug. 1 of this year Ferdinand won the brilliant victory of Minden (*q.v.*). Vellinghausen, Wilhelmsthal, Warburg and other victories followed, and Frederick, hard pressed in the eastern theatre of war, owed much of his success in an almost hopeless task to the continued pressure exerted by Ferdinand in the west. He was promoted field marshal in November 1758.

Ferdinand exerted himself to compensate those who had suffered by the Seven Years' War, devoting to this purpose most of the small income he received from his various offices and the rewards given to him by the allied princes. The estrangement of Frederick and Ferdinand in 1766 led to the duke's retirement from Prussian service, but there was no open breach between the old friends, and Ferdinand visited the king in 1772, 1777, 1779 and 1782. After 1766 he passed the remainder of his life at his castle of Veschelde, where he became a patron of learning and art, and a great benefactor of the poor. He died on July 3, 1792.

See Von Westphalen, *Geschichte der Feldzüge des Herzogs Ferdinands von Braunschweig-Lüneburg* (5 vols., Berlin, 1859-1872); also authorities for SEVEN YEARS' WAR.

FERENTINO, a town and episcopal see of Italy, province of Frosinone (anc. *Ferentinum*, to be distinguished from Ferentum or Ferentinum in Etruria), 48 m. E.S.E. by rail from it. Pop. (1921) 7,776 (town) 15,212 (commune). It is picturesquely situated on a hill 1,290 ft. above sea-level, and still possesses considerable remains of ancient fortifications. The lower portion of the outer walls is built of roughly hewn blocks of limestone; above this in places is walling of rectangular blocks of tufa. Two gates, the Porta Sanguinaria (with an arch with tufa vousoirs), and the Porta S. Maria, a double gate constructed entirely of rectangular blocks of tufa, are preserved. Outside this gate is the tomb of A. Quinctilius Priscus, a citizen of Ferentinum, with a long inscription cut in the rock.

The acropolis has massive retaining walls similar to those of the lower town. At the eastern corner, under the present episcopal palace, a projecting rectangular terrace is supported by walls of quadrilateral blocks of limestone arranged almost horizontally; while upon the level thus formed a building of rectangular blocks of local travertine was raised. A projecting cornice bears two inscriptions of the period of Sulla, recording its construction by two censors (local officials); and in the interior there is an inscription of the same censors over one of the doors, and another over a smaller external side door. The windows lighting these chambers come immediately above the cornice, and the wall continues above them again. The whole of this construction probably belongs to one period. The cathedral occupies a part of the level top of the ancient acropolis; it was reconstructed on the site of an older church in 1099-1118; the interior was restored to its original form in 1902. It contains a fine canopy in the "Cosmatesque" style. The Gothic church of S. Maria Maggiore, in the lower town (13th-14th century), has a very fine exterior. The Romans captured Ferentinum, the chief city of the Hernici, in 364 B.C. It took no part in the rising of 306 B.C. The inhabitants became Roman citizens after 195 B.C. It lay just above the Via Latina and, being a strong place, served for the detention of hostages. Horace praises its quietness, and it does not appear much in later history. (T. A.)

See Ashby, *Röm. Mittel.* xxiv. (1909), 1 sqq.

FERENTUM or FERENTIS, an ancient town of Etruria, about 6 m. N. of Viterbo and 3½ m. E. of the Via Cassia. It was the birthplace (A.D. 32) of the emperor Salvius Otho, was destroyed in the 11th century, and is now entirely deserted. It occupied a ridge running from east to west, with deep ravines on three sides. There are some remains of the city walls, and of various Roman structures, including some baths, of which the most important is the theatre. The stage front is still standing; it is pierced by seven openings with flat arches. It has recently been well restored, and fitted for use for theatrical representation. The necropolis was on the hill called Talone on the north-east. A tomb of the Republican period with several sarcophagi of the gens Salvia, no doubt ancestors of the emperor Otho, has been

found there.

FERETORY, in architecture, the enclosure or chapel within which the shrine or bier-shaped tomb was placed.

FERGHANA, (1) A range of mountains in Asiatic Russia, branching off about lat. 41° N. and long. 75° E. from the Tian Shan range, and rising to altitudes of 12,000 feet or more.

(2) The name given to the rich and fertile valley lying south of this range and north of the Alai mountains, and opening out towards the south west. The climate is dry and warm, with an average temperature of 68° F in March, rising rapidly to 95° through June, July and August. Snow and frost occur in December and January, when the temperature may fall to -4° F. No rain falls during the 5 months following April, and the valley owes its fertility to irrigation from the rivers Naryn and Karadarya, which unite near Namangan to form the Syr-darya or Jaxartes river. On the right bank of the Syr-darya, from Namangan to Khojent, are vast expanses of barren shifting river sand, a menace to the fertile, irrigated areas, upon which they encroach under the influence of the south west wind. The chief crop is cotton; wheat, millet, maize and rice take the next place. Fruits, especially apricots, are widely cultivated and there are numerous vineyards. The area under lucerne is increasing. Silk-worm breeding is dying out, probably through the increasing intensity of cotton cultivation and manufacture. The extension of the Transcaspian railway into Ferghana (1899), and the opening of the Orenburg-Tashkent railway (1906) gave a great impetus to trade and helped to develop the cotton growing industry. In northern Ferghana a rubber-producing euphorbia and other medicinal and aromatic herbs are found. The Ferghana valley has had an eventful history; its fertility has always proved attractive and the Khojent pass made it vulnerable to invaders. It was overrun by Arabs in A.D. 719. In the 9th and 10th centuries it was ruled by the Persian Samanid dynasty, while in the 12th century, it became subject to Kara-Kitai, the fore-runner of Jenghiz Khan, who later conquered it. Tamerlane conquered it later on. In 1513 the Uzbeks expelled Baber, the last descendant of Tamerlane, and until about 1770 the separate cities and clans had each its own Bek, or ruler. From that time until its conquest by Russia, it was ruled by the Khans of Khokand. In 1876 it became part of a much larger unit called Ferghana, which was created as a province of Russian Turkistan, with new Marghelan (now Ferghana) as its administrative centre. Since the fall of the Tsarist régime, the valley has become part of the Uzbekistan S.S.R., though for a time it was an independent Soviet province. Irrigated areas are essentially dependent upon law and order for their productivity, not only because of the need for equable distribution of water to the cultivators, but also because of the constant care and labour necessary to preserve the channels in good order and to prevent bogging or salting of the land. Ferghana consequently suffered severely during the war and civil war of 1914 onwards, and the cotton and other harvests are still below the 1913 level. The Soviet government hopes to introduce modern methods of irrigation and agriculture, but capital is not yet forthcoming, and the cultural level of the population is not such as to make the introduction of scientific methods easy. See also UZBEK REPUBLIC.

(3) A town formerly known as New Marghelan or Skobelev (after the Russian general M. D. Skobelev *q.v.*). It is situated in the Khokand district of the Uzbekistan S.S.R., in lat. 40° 32' N. long. 71° 48' E., in the south-east of the Ferghana valley. It was built by the Russians, after their conquest of the Khanate of Khokand, ten miles south east of the old town of Marghelan, and became the administrative centre for the Ferghana province of the former Russian Turkistan. A branch line links it with the Khokand-Andijan railway, and it has an electric power station and two cotton factories. Pop. (1926) 11,910.

FERGUS FALLS, a city of western Minnesota, U.S.A., 170m. N.W. of Minneapolis, on the Red river of the North; the county seat of Otter Tail county. It is served by the Great Northern and the Northern Pacific railways, and by motor bus lines. The population was 7,581 in 1920 (70% of foreign birth or foreign parentage, largely Scandinavian) and was 9,389 in 1930

by the Federal census. Situated in the "park region" of the State, the city has great natural beauty, enhanced by boulevards, shaded streets and well kept lawns. It is the seat of a State hospital for the insane (1887), of Park Region college (Norwegian Lutheran, 1892), and of Northwestern college (Swedish Lutheran, 1901). There is a hydro-electric plant, and various manufacturing industries. Permanent settlement dates from 1866. The village was incorporated in 1872, and became a city in 1881.

FERGUSON, ADAM (1723-1816), Scottish philosopher and historian, was born at Logierait, Perthshire, and educated at Perth grammar school and the University of St. Andrews. In 1745, he was appointed deputy chaplain of the 43rd (afterwards the 42nd) regiment (the Black Watch), and at the battle of Fontenoy (1745) he fought in the ranks. Having abandoned the clerical profession, in 1757 he succeeded David Hume as librarian to the faculty of advocates, but soon became tutor in the family of Lord Bute.

In 1759 Ferguson was appointed professor of natural philosophy at Edinburgh, and in 1764 of "pneumatics" (mental philosophy) "and moral philosophy." Subsequently his chief publications were: *Essay on the History of Civil Society* (1767), an anonymous pamphlet on the American revolution (1776), and a *History of the Progress and Termination of the Roman Republic* (1783), which passed through several editions. After resigning his professorship in 1785, he devoted himself to the revision of his lectures, which he published (1792) as *Principles of Moral and Political Science*. He died at St. Andrews on Feb. 22, 1816.

Ferguson's ethical speculations were carefully criticized by Cousin (see his *Cours d'histoire de la philosophie morale au dix-huitième siècle*, pt. ii., 1839-40): "We find in his method the wisdom and circumspection of the Scottish school, with something more masculine and decisive in the results. The principle of perfection is a new one, at once more rational and comprehensive than benevolence and sympathy, which in our view places Ferguson as a moralist above all his predecessors."

See *Biographical Sketch* by J. Small (1864); *Public Characters* (1799-1800); Chambers's *Biographical Dictionary of Eminent Scotsmen*; J. McCosh, *The Scottish Philosophy* (1875).

FERGUSON, ROBERT (c. 1637-1714), British conspirator and pamphleteer, called the "Plotter," was a son of William Ferguson (d. 1699) of Badifurrow, Aberdeenshire. He became vicar of Godmersham, Kent, from which living he was expelled by the Act of Uniformity in 1662. In 1680 he wrote "A letter to a Person of Honour concerning the 'Black Box,'" in which he supported the claim of the duke of Monmouth to the crown against that of the duke of York; he also claimed the authorship of the pamphlet "No Protestant Plot" (1681), parts of which are usually ascribed to Shaftesbury. Ferguson was deeply implicated in the Rye House plot, and fled to Holland with Shaftesbury in 1682, returning to England early in 1683. For his share in another plot against Charles II. he was outlawed. Ferguson took a leading part in organizing Monmouth's rising of 1685. He drew up the manifesto against James II., escaping to Holland after the battle of Sedgemoor. He landed in England with William of Orange in 1688, and received a sinecure appointment in the Excise. Ferguson was soon in correspondence with the exiled Jacobites. He shared in all the plots against the life of William, but although he was several times arrested on suspicion, he was never brought to trial. He died in great poverty in 1714, leaving behind him a great and deserved reputation for treachery. It has been suggested that Ferguson was a spy, and that his frequent escapes from justice were due to official connivance.

See James Ferguson, *Robert Ferguson, the Plotter* (Edinburgh, 1887), which gives a favourable account of Ferguson.

FERGUSON, SIR SAMUEL (1810-1886), Irish poet and antiquary, was born at Belfast. He was educated at Trinity college, Dublin, was called to the Irish bar in 1838, and was made Q.C. in 1859, but in 1867 retired from practice upon his appointment as deputy-keeper of the Irish records. He was knighted in 1878. His two masterpieces, "The Forging of the Anchor," one of the finest of modern ballads, and the humorous prose extravaganza of "Father Tom and the Pope," appeared in *Blackwood's*

Magazine. He published *Lays of the Western Gael* in 1865, *Poems* in 1880, and in 1872 *Congal*, an attempt to revivify the heroic age of Ireland in an epic poem. He died at Howth on Aug. 9, 1886. His most important antiquarian work, *Ogham Inscriptions in Ireland, Wales, Scotland*, was published in 1887.

See *Sir Samuel Ferguson in the Ireland of his Day* (1896), by his wife, Mary C. Ferguson; also an article by A. P. Graves in *A Treasury of Irish Poetry in the English Tongue* (1900), ed. Stopford Brooke and T. W. Rolleston; and J. O'Hagan, *Poetry of Sir Samuel Ferguson* (1887).

FERGUSON, JAMES (1808-1886), Scottish writer on architecture, was born at Ayr on Jan. 22, 1808. His father was an army surgeon. During ten years spent in manufacturing indigo in India he collected material for his *Rock-cut Temples of India* (1845). His real monument is his *History of Architecture* (1865, later edition revised by R. Phenè Spiers), which is a standard work. He died in London on Jan. 9, 1886.

FERGUSON, ROBERT (1750-1774), Scottish poet, son of Sir William Ferguson, was born in Edinburgh. He was educated at Dundee Grammar school and St. Andrew's and became a copying clerk in a lawyer's office in Edinburgh. In 1771 he began to contribute poems to Ruddiman's *Weekly Magazine*. He was a member of the Cape Club, celebrated in his poem "Auld Reekie," the members of which used to meet at a tavern in Craig's Close. He was severely injured in the head by a fall, and died at Darien House asylum on Oct. 16, 1774. His poems were collected a year before his death, and are interesting for their influence on Burns, whose "Holy Fair," for instance, is modelled on Ferguson's "Leith Races." Burns himself put up the memorial stone on Ferguson's grave in 1787.

See D. Irving, *Lives of the Scottish Poets* (1804); R. Chambers, *Biographical Dictionary of Eminent Scotsmen* (1835); *The Poems of Robert Ferguson, with a sketch of the author's life by Robert Aitken* (1916); *The Poetical Works of Robert Ferguson, with a biographical introduction by R. Ford* (Paisley, 1917).

FERGUSON, SIR WILLIAM, BART. (1808-1877), British surgeon, was born at Prestonpans, East Lothian, on March 20, 1808. He was a pupil at Edinburgh of the anatomist Robert Knox (1791-1862) whose demonstrator he was appointed at the age of twenty. In 1836 he succeeded Robert Liston as surgeon to the Edinburgh Royal infirmary, and went to London in 1840 as professor of surgery in King's college, and surgeon to King's College hospital. Ferguson revived the operation for cleft-palate, which for many years had fallen into disrepute, and invented a special mouth-gag for the same. He also devised many other surgical instruments, chief among which, and still in use to-day, are his bone forceps, lion forceps and vaginal speculum. In 1866 he was created a baronet. He died in London on Feb. 10, 1877. Ferguson introduced the practice of "conservative surgery," by which he meant the excision of a joint rather than the amputation of a limb. He was the author of an admirable historical work, *The Progress of Anatomy and Surgery in the Nineteenth Century* (1867), and of a *System of Practical Surgery* (1842), which went through several editions.

FERINGHI or **FERINGHEE**, an Asiatic term for a European originally used in a purely geographical sense (Persian, *Farangi*, Frank) but now generally carrying a hostile significance. The combatants on either side during the Indian Mutiny called each other Feringhies and Pandies.

FERISHTA, MOHAMMED KASIM (c. 1570-c. 1611), Persian historian, was born at Astrabad, on the shores of the Caspian Sea. In 1589 Ferishta removed to Bijapur, where he spent the remainder of his life under the immediate protection of the shah Ibrahim Adil II., who engaged him to write a history of India. At the court of this monarch he died about 1611. In the introduction to his work a *résumé* is given of the history of Hindostan prior to the times of the Mohammedan conquest, and also of the victorious progress of the Arabs through the East. Ferishta is reputed one of the most trustworthy of the Oriental historians, and his work still maintains a high place as an authority. Several portions of it have been translated into English; but the best as well as the most complete translation is that published by General J. Briggs under the title of *The History of the Rise of the Mahometan Power in India* (London, 1829, 4 vols. 8vo).

FERMANAGH, a county of Ireland, in the province of Ulster, bounded north-west by Donegal, north-east by Tyrone, east by Monaghan, and south to west by Cavan and Leitrim. The area is 417,912 ac., or about 653 sq. miles. The county lies chiefly in the basin of the Erne, which divides it into two nearly equal sections. The surface is hilly and, especially round Lough Erne, is picturesque. The climate, though moist, is healthy. The chief mountains are Cuilcagh (2,188 ft.) and Tiltinbane (1,949), partly in Leitrim and Cavan; Belmore (1,312), west of Enniskillen; Glenkeel (1,223); Shean North (1,135), rising from Lough Erne; Tappaghan (1,122) in the north; Dooaharn (1,255) and Carnmore (1,034) on the east of the loughs. Tossett or Toppid and Turaw (Tooraw) mountains on the west form striking features in the scenery. But the most distinguishing features are the Upper and Lower Loughs Erne, stretching from south-east to north-west. These lakes are expansions of the river Erne, which enters the county from Cavan, flows through Upper Lough Erne, past Enniskillen and through Lower Lough Erne, on its way to the Atlantic at Ballyshannon. At Belleek it forms a considerable waterfall, and is here notable for good salmon fishing. Trout are taken in most of the loughs, and pike of great size in the Loughs Erne. The western boundary takes in a small portion of Lough Melvin, and Upper and Lower Loughs Macnean (or Lough Nilly) lie on the Cavan border. Various streams feed the two principal loughs. There are chalybeate and sulphur springs. At Belcoo, near Enniskillen, there is a well in local repute for its cure of paralytic and other diseases; and 4 m. N.W., at a place called "the Daughton," are natural caves.

This county includes in the north an area of gneiss from Donegal and a metamorphic region from Tyrone. A fault divides the latter from the Old Red Sandstone that spreads south. Limestone forms fine scarps on the south side of Lower Lough Erne, capped by beds regarded as the Yoredale series. The scenery about Loughs Macnean rises in similarly scarped hills to the summit of Cuilcagh. The "Marble Arch" cave near Florencecourt, with its emerging river, is a characteristic subterranean waterway in the limestone. Higher Carboniferous strata form highlands north-east and south-west of Upper Lough Erne.

Fermanagh is chiefly a pastoral and agricultural county. There are pottery works at Belleek. Three branches of the G.N. railway—from Clones, from Londonderry via Omagh, and from Bundoran—meet at Enniskillen. The Sligo, Leitrim and Northern Counties railway, connecting with the southern and western systems, also runs to Enniskillen, and the Clogher Valley light railway connects with the G.N. railway at Maguiresbridge.

Population and Administration.—The population (57,985 in 1926) has shown a steady decrease (by emigration) at every census since 1841, when it was nearly 100,000 larger. In 1911 56% were Roman Catholics, 34% Church of Ireland; 25% were Irish-speaking. The county is divided for administrative purposes into the urban district of Enniskillen (pop. [1926] 4,883) and rural districts of Enniskillen (17,795), Irvinestown (13,846) and Lisnaskea (21,461)—the two last having absorbed the former rural districts of Belleek and Clones in 1921. The county council consists of 22 councillors, presided over by a chairman and vice-chairman. Fermanagh is in the Northern Ireland circuit, with assizes at Enniskillen, the county town, and quarter sessions at Enniskillen and Newtown Butler, and has 13 petty sessional districts. The Poor Law unions run with the neighbouring counties, except Leitrim. In addition to the places named, Kesh, Lack, Derrygonnelly and Lisbillard have markets and fairs. Irvinestown and Lisnaskea also have a monthly flax market. Under the Government of Ireland Act, 1920, the county was united with Co. Tyrone in returning two members to parliament. Ecclesiastically it falls within the two dioceses of Clogher and Kilmore (both Protestant and Roman Catholic).

History.—By the ancient Irish the district was called *Feor-magh-Eanagh*, or the "country of the lakes"; and also *Magh-uire*, or "the country of the waters." A large portion was occupied by the *Guarii*, the ancestors of the MacGuire or Maguires, a name still common. Another derivation refers the name to a tribe of the *Fir Monach* that settled here in the 3rd century, while the old

baronies of Clankelly and Clanawley refer to other ancient Irish clans. Fermanagh was formed into a county on the shiring of Ulster in 1585 by Sir John Perrot, and was included in the scheme of colonization of James I., the Plantation of Ulster. In 1689 battles were fought between William III.'s army and the Irish under Macarthy (for James II.), at Lisnaskea and Newtown Butler. In various places may be seen the ruins of ancient castles, Danish raths or encampments, and tumuli, in the last of which urns and stone coffins have been found, with other early Irish and ecclesiastical ruins on some of the small islands in Lower Lough Erne. Of these the chief is Devenish island, near Enniskillen (*q.v.*), with its ruined abbey, stone cross and one of the finest examples of a round tower in the country.

FERMAT, PIERRE (1601–1665), French mathematician, was born on Aug. 17, 1601, at Beaumont-de-Lomagne near Montauban. In his youth, with Pascal, he made discoveries about the properties of numbers, on which he later built his method of calculating probabilities. His book *De maximis et minimis* caused a dispute with Descartes. His brilliant researches in the theory of numbers entitle him to rank as the founder of the modern theory. They were made, and in 1670 published by his son, in the form of notes on Diophantus. Other theorems were published in his *Opera Varia*, and in John Wallis's *Commercium epistolicum* (1658). He also studied the reflection of light (*q.v.*) and enunciated his *principle of least time*. For *Fermat's Last Theorem* see below.

Fermat was a councillor for the parliament of Toulouse, distinguished both for legal knowledge and for strict integrity of conduct. He was also an accomplished general scholar and linguist. He died at Castres, near Toulouse, on Jan. 12, 1665.

The *Opera mathematica* of Fermat were published at Toulouse, in 2 vols. folio, 1670 and 1679. The *Oeuvres* of Fermat, including not only the *Opera mathematica*, but his correspondence with Descartes, Pascal and others, were edited by P. Tannery and C. Henry (Paris, 1891–94).

FERMAT'S LAST THEOREM, a statement which is famous in the history of mathematics, namely that there do not exist integers x , y and z , none of which being zero, which satisfy

$$x^n + y^n = z^n, \quad (1)$$

n being a given integer > 2 . It was first given by Fermat who wrote, about the year 1637, upon the margin of his copy of the works of Diophantus, "I have discovered a truly remarkable proof which this margin is too small to contain." He did not publish his proof, however, and no complete demonstration has as yet been discovered.

The theorem was proved by Euler for $n=3$ and 4. To prove it in general, it is then not difficult to see that it is sufficient to demonstrate the impossibility of

$$x^l + y^l + z^l = 0 \quad (2)$$

in non-zero integers x , y and z for any odd prime $l > 3$. This was proved by Legendre in 1823 for $l=5$, and later by Lebesgue for $l=7$. These proofs excited great interest among the mathematicians of the time and many efforts were made to extend them to other values of l , a number of them resulting in errors. For example, the celebrated mathematicians Lamé and Cauchy published many results concerning (2) which were based on assumptions later proved false. The discussion and study of these mistakes led to the formulation, by Kummer, of one of the most powerful and fruitful concepts which has ever been introduced into mathematics, *i.e.*, the notion of *ideal* numbers. By means of this idea Kummer was able to prove (in 1850) that (2) is impossible in integers x , y and z , none zero, for all primes l for which none of the numerators of the Bernoulli numbers (*q.v.*) B_a , $a=1, 2, \dots, (l-3)/2$, is divisible by l , where $B_1=1/6$, $B_2=1/30$, etc. Primes l of this character are called *regular*. By extensive numerical computations he found that the only primes less than 100 which are not regular are 37, 59 and 67, and in a later article published in 1874 he obtained results from which it may be inferred that the only primes which are not regular between the limits 100 and 166 are 101, 103, 131, 149 and 157. In the year 1857 Kummer published another memoir in which he concluded after a long and complicated procedure that (2) is

impossible under three assumptions concerning the nature of the algebraic field defined by ζ where $\zeta = e^{2\pi i/l}$. He finds, again by the use of extensive numerical computations, that these three assumptions are satisfied for $l=37, 59$ and 67 , and hence that (2) is impossible for all primes $l < 100$.

In papers published recently by H. S. Vandiver several errors were pointed out in the arguments employed by Kummer in his paper of 1857 and the necessary corrections were made. The latter's extensive numerical computations concerning the regular and non-regular primes l which are less than 100 and which we have already referred to, have not all been checked, however, by other writers. If we assume they are all correct then (2) has been proved impossible for all primes $l < 100$. For the statement of later results we shall divide the discussion into two cases. If in (2), x, y and z are prime to each other and to l , this condition will be referred to as case I. of Fermat's last theorem; if x, y and z are prime to each other and one of them is divisible by l , the condition will be called case II. of the theorem. We shall also confine ourselves to mentioning only those criteria for the solution of (2) which do not involve in their enunciation the theory of algebraic numbers.

Legendre published in 1823 the following theorem due to Sophie Germain:—If there exists an odd prime p such that the congruence

$$u^l + v^l + w^l \equiv 0 \pmod{p} \quad (3)$$

has no set of integral solutions u, v and w , each not divisible by p , and such that l is not the residue of the l th power of any integer modulo p , then (2) has no solutions x, y and z , each prime to l . By means of this result Sophie Germain proved that (2) is impossible in case I. for all primes $l < 100$.

In 1857 Kummer proved that if (2) is satisfied in case I. then

$$B_n \left[\frac{d^{l-2n} \log(x + e^y)}{dy^{l-2n}} \right]_{y=0} \equiv 0 \pmod{l}, \quad (4)$$

$n=1, 2, \dots, (l-3)/2$, where B_n is, as before, the n th Bernoulli number and the other symbol designates the result obtained by taking the $(l-2n)$ th derivative with respect to y of the logarithm of $x + e^y$, where e is the Napierian base, and setting $y=0$. In 1905, Mirimanoff showed that the criteria (4), with the others obtained from them by replacing x by z , etc., are equivalent to

$$\frac{B_{l-i}}{2} f_i(i) \equiv 0 \pmod{l}, \quad (4a)$$

$$i=3, 5, \dots, l-2; -i=x/y, y/x, x/z, z/x, y/z, z/y;$$

$$f_i(i) = \sum_{k=1}^{l-1} k^{i-1} i^k, \quad (4b)$$

and added the criterion

$$f_{l-1}(l) \equiv 0 \pmod{l}$$

for the solution of (2) in case I. The criteria (4a) and (4b) are now generally referred to as the Kummer criteria.

In 1908 Dickson, using Sophie Germain's theorem, proved that (2) is impossible in case I. for all primes $l < 7,000$. Wieferich, in 1909, by the use of (4a) and (4b) proved that, if (2) is possible in case I., then $2^{l-1} \equiv 1 \pmod{l^2}$, and in 1910 Mirimanoff obtained, on the same assumption, $3^{l-1} \equiv 1 \pmod{l^2}$. Furtwängler in 1912 proved that, if (2) is satisfied in case I. and r is a factor of x or of $x^2 - y^2$, where $x^2 - y^2 \equiv 0 \pmod{l}$, then $r^{l-1} \equiv 1 \pmod{l^2}$. This result includes those of Wieferich and Mirimanoff just referred to. In the year 1925 Beeger found that the only primes $l < 14,000$, for which $2^{l-1} \pmod{l^2}$ are $l=1,093$ and $l=3,511$, the case $l=1,093$ having been previously noted by Meissner. Using these results with those of Dickson he concludes that (2) is impossible in integers x, y and z prime to l , for all primes $l < 14,000$. H. S. Vandiver obtained in 1926 the theorem that, if there exists an odd prime $p = 1 + ml$, such that $m < 10l$ and

$$u^l + v^l + w^l \equiv 0 \pmod{p},$$

has no set of integral solutions u, v, w , each not divisible by p , then (2) has no solution in case I. He also proved (1925) that if (2) is satisfied in case I. then

$$\dots f_i(t) f_{l-i}(l^{l-i} \equiv 0 \pmod{l})$$

$i=1, 2, \dots, l-1$; t having the same meaning as in (4a).

As to case II. of the theorem, i.e., when one of the integers x, y and z in (2) is divisible by l , no result has been published which is known to represent an advance over Kummer's results in his memoir of 1857. In general, as to the present attitude towards Fermat's last theorem, there is evident among mathematicians a growing opinion that it is not true. In particular, several specialists in the theory of numbers think that it is quite possible that there exist odd prime integers l and integers x, y and z prime to each other, $z \equiv 0 \pmod{l}$ such that

$$x^l + y^l + z^l = 0.$$

However, in case I., everything indicates that it is true, although it has not been proved. That it has not been proved for this case is one of the most amazing facts in present-day mathematics, and for this reason alone the great celebrity of the theorem is perhaps justified. Also the many attempts to solve it by competent mathematicians have led to a number of remarkable developments in number theory, including very abstract conceptions and profound results, arrived at only after long chains of reasoning. In 1907 the Wolfskehl prize of 100,000 marks, for the first demonstration of the theorem was established. This led to the publication of several thousand erroneous "proofs" by individuals who were, for the most part, not at all equipped mathematically to cope with the problem.

FERMENTATION. Fermentation seen in the making of bread, in wine making and brewing is the classical example of the change brought about in materials containing starch or sugar, by the action of yeast. In the case of wine making, brewing and the making of bread, the fundamental chemical changes are the same, for starch must first be transformed into sugar before it can be fermented in the accepted sense of the word, that is to say, before it can undergo the decomposition into alcohol and carbon dioxide which is the essence of alcoholic fermentation. The yeast decomposing the sugar gives rise to carbon dioxide gas which first saturates the fluid or fills the interstices of the solid. The excess of gas escapes, causing a frothing and bubbling of the liquor, but in most fermented materials some of the carbonic acid gas remains and is partly responsible for the exhilarating and pleasing properties of the fluid. The rising of dough is due to the pressure generated by carbon dioxide gas, and this action is observed in an accelerated manner when the bread is first put into the oven. The rate at which the dough rises or is fermented depends upon several factors such as the temperature, and the amount of salt present, so that by varying such factors the baker is able to hold the process under control.

Yeast is now known to be a living material, and the spores or germs of yeast are to be found everywhere adherent to the particles of dust in the air. Consequently any sugary material exposed to the air quickly becomes fermented. Prior to the discovery of such germs in the atmosphere the ferment or leaven was supposed either to have been produced spontaneously, generated as it were, within the material itself by some occult force, or else to have been derived from pre-existing yeast from time immemorial. This latter view was nearer the truth, for it conceived of yeast as something akin to life. Indeed when questioned as to the origin of the Kephir ferment, which is analogous to yeast, Mohammedans in the Caucasus to this day will declare that the first grains of Kephir were put there by Allah. And is not, in the New Testament, the comparison of the Kingdom of Heaven, made at one time to a seed, and at another time to leaven?

It would be fallacious, therefore, to imagine because of the materialistic tendencies of the alchemists, that humanity had never had any conception of yeast as a living thing, or of fermentation as a process akin to life.

The alchemists, however, mixed up all sorts of phenomena, on

the strength of superficial analogies, and applied the name fermentation to any change accompanied by an evolution of gas, as, for example, the action of acids on chalk or soda, or the formation of a froth or scum on metals when calcined. The philosopher's stone was supposed to set up a fermentation in the base metals and give rise to the noble metals. In short, fermentation was any sort of boiling or bubbling set up in a cauldron or crucible (Latin *Fervere*, to boil).

The Antiquity of the Art of Fermentation.—It is impossible to place any date to the antiquity of the art of fermentation, and much that passes at the present time as novel was known to the ancients. The addition of preservatives to wine, or the application of heat to fermented liquors to prevent their subsequent deterioration, for which many patents were taken out immediately after Pasteur's demonstration of the microbic cause of disease in wine, were practices well known to the Greeks and the Romans, and probably at still more remote times.

Pliny tells us that wine was liable to become vinegar during a voyage, but that such wines as withstood the voyage were actually more mature than they would have been in the same time on land. He points out the necessity of leaving a space between jars of wine in a cellar, to prevent "contagion." He gives also an interesting description of the preparation of a medicinal wine called *blos* meaning life. Pliny praises this wine, as justly reputed to cure many diseases. It should be prepared, he says, by gathering the grapes in the sunshine which follows rain, turning the grapes daily, twice or thrice before crushing, and subsequently maturing the wine in the sun. In the absence of rain, the indications were to expose the grapes still longer to the sun, presumably to destroy the impurities which the rain would have washed away.

Belon writes that wines of Crete were always brought to the boil prior to exportation.

Columelle, apparently the most reliable of the early writers on this subject, indicates how wine may be prevented from alteration by a preliminary heating of the grape juice (must), and the importance of adding water from a well in the same district as that of the vineyard to replace the water lost by evaporation. This writer recognizes also that the best wines are such as do not require any treatment, for, as he says, that which can please without any resort to artifice is superior to all.

Ideas of Fermentation at the Beginning of the 19th Century.—Such ancient practices, however, hardly found any echo in the ideas of the 18th and early 19th century. Vitalism was in disrepute, the microscope had not been perfected, and its revelations were but little credited; chemistry had just made rapid strides to the front, and organic chemistry, through the masterful work especially of Liebig and Wöhler, had become established as the sure way to a study of physiology, medicine and agriculture. Any attempt to introduce vague and unknown causes, as for example a possible influence of microscopic forms of life in the process of fermentation, was considered retrograde and branded as vitalistic.

It was thought that the classical way to treat the subject of fermentation was as Lavoisier had treated it, namely to study the chemical changes, but to leave the question of the nature of the ferment strictly alone. A theory due to Georg Stahl (1697) was advocated by Berzelius (1843) and Liebig about the same time. Liebig's idea was much the same as that of Stahl, namely that a ferment was an albuminoid substance in the act of decomposing, and hence in a condition of internal or molecular vibration, and that this vibration could be communicated to other materials, causing them thus to ferment. Berzelius' idea was less committal. For him it sufficed that the presence of the ferment caused the decomposition to be set up in the material and he did not specify anything as to the internal condition of the ferment itself. Berzelius introduced the term catalytic action, to express the idea that the ferment did not really take a part in the changes in any chemical sense, but acted by contact.

Liebig had certainly strong evidence that certain changes analogous to fermentation could occur in the absence of life. Bitter almonds crushed with a little water underwent a change, which led to the decomposition of a sugar compound (glucoside), with

the liberation of sugar, prussic acid, and an aromatic principle which gives to the almonds a most characteristic odour. This decomposition did not occur if the almonds were boiled with water for a few minutes. The change was therefore brought about apparently by some agency very analogous to a ferment which was also destroyed by heat. Liebig and Wöhler showed, however, that destroying the life in the almonds did not prevent the action of this ferment-like principle, for they could precipitate the active substance by means of concentrated alcohol, and isolate it as a white amorphous powder still possessing the ability to decompose the glucoside.

And another very remarkable fact tended to strengthen the then current views that fermentation could be explained without invoking the idea of the intervention of life. This was the discovery made by Edmund Davy (1820) that finely divided platinum, sometimes called spongy platinum or platinum black, could by its mere contact with alcohol or alcohol vapour produce acetic acid, which was known to be the acid produced from wine in the ordinary process of vinegar fermentation. The platinum black, in contact with alcohol, became spontaneously red hot, and remained glowing as long as alcohol vapour was present.

The various above-mentioned considerations, however, represented rather isolated pieces of information than any definite knowledge as to the nature of fermentation, and it was by no means sure that there was any real connection, for example, between the soluble ferment which Liebig obtained from almonds, and the classical process of alcoholic fermentation, which, after all, in view of its vast practical importance in industry, was really the type of fermentation by which all others were to be judged.

The Revelations of the Microscope.—There can be no doubt that we must look to the invention by Leewenhoek (1680) of a microscope powerful enough to render visible the structure of the material known from time immemorial as associated with fermentation, namely yeast, or leaven, as the milestone which marks the progress of mankind towards a knowledge of the meaning of fermentation. Leewenhoek observed the structure of yeast but did not recognize that it was living. The honour of this latter discovery fell to Cagniard de la Tour (1837), and to F. Kützing (1837), who observed the budding of the yeast cells and recognized it as a vegetative act, and to T. Schwann (1839) who was the first to recognize the formation of yeast spores. These observations did not, however, receive the attention which they merited, and their essential connection with the phenomenon of fermentation was stoutly denied by J. V. Liebig (1839), whose reputation stood so high that his condemnation sufficed almost to discredit the facts.

When the facts of the biologist were denied by the chemist, there was clearly no prospect of agreement or decision unless someone could come forward who might be authorized to speak in the name of both sciences. Only the rarest genius could at such a time have occupied such a position. The genius was found in Louis Pasteur. Pasteur opened the eyes of mankind to a new world of living things, the world of microscopic life. Such microscopic beings, he proved, could live upon mineral matter, using for body building and as a source of energy the simplest forms of carbon compounds such as alcohol, acetic acid or sugar, while ammonia sufficed as a source of nitrogen. Each type of fermentation was shown to be correlated with the life of some special microscopic organism, multiplying with incredible velocity. Fermentation, putrefaction and the slow process of combustion by which dead organic matter is resolved into mineral matter, at that time designated spontaneous combustion, were all shown to be caused by the agency of microbes, and to cease when the life was destroyed. Pasteur foresaw disease as the outcome of a failure of plant or animal to resist the attacks of inimical forms of microscopic life ever present in the dust of the atmosphere, in soil, water or as a contamination of food.

It would be impossible to enter here into the great variety of fermentations which Pasteur studied, and it will be better to confine our attention to one case, namely alcoholic fermentation set up by yeast, for this will serve as an example for all other types.

The contribution made by Pasteur to our knowledge of alcoholic

fermentation, can, however, be better appraised if we first resume what was known of the matter before he began. This can be done briefly, for it does not amount to much.

Facts Known About Alcoholic Fermentation Prior to the Work of Pasteur.—Of facts definitely established before Pasteur came upon the scene, we have the following. Lavoisier (1793) regarded alcoholic fermentation as a chemical change, in which the yeast was a mere agent which, in a quantitative study of the changes, could be ignored. He showed that the amount of alcohol and carbon dioxide gas produced in the course of the fermentation weighed the same as the sugar used at the beginning of the experiment, and he used this result to announce his far-reaching generalization, that nothing is ever lost or destroyed, but that matter only undergoes change of form. Actually there were errors in Lavoisier's experimental work, but the deductions were correct, and were soon supported on theoretical grounds by Gay-Lussac. This investigator also showed that oxygen was necessary for the commencement of the fermentation. He placed grapes in a closed tube over mercury, and introduced various gases before crushing the grape. No fermentation followed unless air or oxygen was allowed to enter the tube. The elementary composition of yeast had also been determined by Dumas (1828), and the general analysis of main constituents had been made by Payen (1839), and Mitscherlich (1835), who gives the composition of the ash of beer yeast, and also by the careful work of Schlossberger (1844) who distinguishes the composition of top and bottom yeast.

Colin (1825) had found that the best medium for the "growth" of yeast was an extract by hot water of the yeast itself, and the albuminous nature of yeast was generally recognized, though the origin of the albuminous matter was not understood, the general view being that it must have arisen by the decomposition of pre-existing animal or vegetable matter.

Thenard (1803) emphasized the importance of not confusing alcoholic fermentation with other processes, and taught that yeast was the cause of the fermentation. He likewise took up an independent position with regard to the fate of the yeast during fermentation. Liebig taught that during fermentation the yeast underwent decomposition (this was, of course, essential to his theory), and that the evidence of the decomposition was the formation of ammonia in the solution, for all albuminous substances were known to yield ammonia on decomposition. Thenard, however, was in doubts as to whether ammonia was formed, as he himself did not find it in appreciable amount. The yeast likewise did not appear always to lose weight during the fermentation, though sometimes it appeared to do so.

The fact should also be mentioned that traces of products other than alcohol and carbon dioxide had been detected in the fermented fluid and were supposed to be derived from sugar, in particular, acetic acid and lactic acid. The amounts produced were so small, however, that it could not be considered proved that these materials truly had been derived from the sugar. They might have arisen from the nitrogenous matter present in the solution.

Pasteur's Studies in Alcoholic Fermentation.—Pasteur admitted that the idea of the living cause of fermentation was a preconceived one with him, but it was strengthened towards a conviction by the consideration that the amyl alcohol produced as a by-product in fermentation was different from amyl alcohol produced synthetically in the laboratory, the latter was optically, and hence structurally symmetric, the former asymmetric. He then discovered the fact that racemic ammonium tartrate which is itself optically inactive, is decomposed by a mould such as *Penicillium glaucum*, in such a way that the solution develops optical properties. The observation instrument or polarimeter lets through light vibrating in one plane only, and may be set by crossing the prisms, so that no light vibrating in this plane can come through. The solution examined at the beginning of the experiment under these conditions appears in complete darkness, but as the fermentation progresses light appears, for it is now transmitted through the solution in another plane, owing to the development in the solution of an optically asymmetric substance. What actually has happened in this case is that one of the two optically

opposite tartrates which are constituents of the racemic tartrate has been consumed or fermented by the fungus, leaving the other therefore exhibiting its optically asymmetric property. The remarkable fact, therefore, that in the process of fermentation one type of structure was selected and the other rejected, indicated to Pasteur that the relation between the ferment and the substance which it fermented was of the most intimate kind, and convinced him that nothing but life could be responsible for such a preferential treatment of molecules. This led to the view that each type of fermentation must be correlated with a specific organism, and Pasteur set to work to find the organisms.

In rapid succession he discovered the organisms responsible for the formation of lactic acid, butyric acid and acetic acid, as well as certain other organisms which, like the butyric acid organism, he found could act in the complete absence of air, which led to the distinction of aerobic and anaerobic forms of life. The main issue, however, was that of the part played by yeast in the alcoholic fermentation. Few people took the attitude of Liebig of denying absolutely that yeast was alive, but many denied that the life of the yeast and the process of fermentation were connected in any essential way, while others stated that the yeast acted only after it was dead, in common with any other albuminous matter, as was postulated by the theory of Stahl, modified by Liebig.

Pasteur showed that Liebig's theory of fermentation set up by decomposing albuminous matter was utterly untenable. Liebig cited the alleged evidence that ammonia was produced by the decomposition of the yeast. Pasteur demonstrated that no ammonia was formed during alcoholic fermentation, but on the contrary a large amount was absorbed by the yeast and synthesized into its protoplasm. Pasteur found he could actually grow yeast on a purely artificial medium made of various salts, with ammonia as a source of nitrogen, and with sugar as a source of carbon, and he offered to show Liebig a kilogram of pure white yeast produced exclusively out of these materials from an amount of yeast originally as large as a pin's head. The Academy offered to defray the cost of Liebig's visit to Paris. But Liebig was obstinate and refused the offer. The production of a kilogram of pure yeast out of sugar and salts and ammonia was masterful evidence and left very little of Liebig's theory of fermentation set up by decomposition.

Pasteur next concerned himself with the origin of yeasts and traced them to the atmospheric dust. He showed that all the germs or spores of these microscopic organisms causing fermentation, putrefaction and analogous changes, existed in the air, in amount varying with the place, the altitude, the temperature and the season, and by ingeniously filtering the air through guncotton, and dissolving the guncotton in ether, he isolated the germs from the air, and was able to examine them under the microscope and prove by experiment their respective properties.

Following up the classical experiment of Gay-Lussac which appeared to demonstrate that fermentation could not take place without air, Pasteur was led to recognize that oxygen was needed for the germination of the yeast spores, but that for the process of reproduction by budding it was not essential, and a close study of the behaviour of yeast under varying conditions of aeration revealed the remarkable fact that yeast could at one time behave as an aerobe and at another time as an anaerobe. In the presence of air the growth was very vigorous, much more so than in the absence of air, but on the other hand fermentation as measured by the production of alcohol was much in abeyance, while conversely, when the yeast was deprived of air, growth was not so abundant, but fermentation very much more vigorous. Here, thought Pasteur, is the long-sought secret of fermentation, the yeast, and in fact, any organism deprived of the free oxygen of the atmosphere, will react with substances such as sugar dissolved in the medium, in the effort to obtain from them their oxygen of combination, and in proportion as an organism can succeed in obtaining oxygen in this way it will be capable of setting up fermentation. All tissues of plants or animals might thus produce alcoholic fermentation for a brief fraction of time, and some by a gradual development of this faculty would become ferments, either facultative or permanent anaerobes.

It may be thought that Pasteur went too far in thus denoting fermentation *Vie sans air*, yet as A. J. Brown (1892) pointed out, exception could not be taken to the view if into the words with which Pasteur summarises his theory, we read the meaning that that part of the life of the yeast which is most closely correlated with the phenomenon of alcoholic fermentation can take place in the absence of air, or to be precise, oxygen.

One final point in regard to the chemistry of alcoholic fermentation should be mentioned by way of definitely recording the fact that Pasteur regarded the change set up in sugar by yeast as more complicated than had been stated by Lavoisier. Pasteur was at pains repeatedly to point out that accompanying the main change of sugar to alcohol and carbon dioxide there was always a formation in definite proportion, amounting to about 2% of the sugar fermented, of two substances, glycerine and succinic acid. These were formed even when sugar was the only source of carbon, and must therefore have been derived from the sugar. The constant production of these substances, albeit in small amount, revealed to Pasteur the essential complexity of the fermentative act, and later progress has substantiated fully his view.

Their logical sequence is such an instructive feature of Pasteur's researches, that it would be wrong not to point out how the researches on fermentation led to the investigation of disease in wine and vinegar, and how from the conception of epidemics of yeast and other benign organisms, Pasteur was led to the conception of the cause of epidemic disease in plants, in animals and man.

Progress Since the Time of Pasteur.—It was generally felt both by physiologists and chemists that the idea of fermentation ought to include digestion and the action of many principles extracted from plants, as, for example, emulsin which Liebig and Wöhler had extracted from bitter almonds, and which was able to decompose the glucoside amygdalin, and that some conception of the action of the immediate cause of fermentation must be found which did not invoke the idea of life. A bridge, in other words, was required between the life phenomena on the one hand, and the physicochemical phenomena on the other. Something to reconcile the extremes of Pasteur's idea that life was everything, and Liebig's idea that life was nothing in the phenomena. Claude Bernard (1878) felt the matter so strongly, yet not wishing to hurt Pasteur's feelings, that he secretly devoted the last few years of his life in a vain effort to prove the presence of a soluble ferment in yeast. Pasteur, he said, is right, but he does not see far enough, and almost his last words to d'Arsonval were: "Fermentation must be freed from the vitality of the cell."

A reconciliation was found in the idea of enzymes, these being the agencies by which living matter brings about fermentation, using the word in the broad sense of including nearly all chemical changes brought about by living matter which are capable of being independently studied. M. Traube (1858) had put forward this idea, and Naegeli's theory (1879) was an attempt at a sort of physicochemical expression of the idea of the relation of the living cell to the material on which it acted, through the intermediary of the enzyme. But the real evidence was obtained by E. Fischer and E. Buchner. Fischer (1895) found that the specificity in action which Pasteur had observed for the mould *Penicillium glaucum*, in fermenting racemic ammonium tartrate could be paralleled by a similar behaviour of soluble ferments or enzymes, and that a soluble ferment or enzyme extracted from yeast, namely invertase, could act on one type of sugar derivative but not on another. Buchner (1897) made one of the greatest steps in the history of fermentation by discovering that, under great pressure, a juice could be expressed from yeast, which was free from yeast cells, and therefore presumably no longer living, but which, nevertheless, was able to act quite effectively in setting up alcoholic fermentation. The views of those who held that fermentation was independent of life have, therefore, to a certain extent been shown to have been justified. On the other hand, it is quite clear that since the enzymes are themselves the product of the living organism, Pasteur's position remains unassailed. It is also important to remember that the name enzyme is given to a material derived from the living cell, which has never been isolated as an individual chemical compound. No pure enzyme has ever been obtained, nor

have we at present the least idea whether any of the enzyme preparations at present known are even approximately pure. Nevertheless, the idea of enzymes has undoubtedly helped greatly to a better conception of the mechanism of fermentation.

Fermentation has, in common parlance, come to have two meanings; on the one hand it refers to alcoholic fermentation, which on account of its great industrial importance, overshadows all other types of fermentation; and, on the other hand, it refers to a large variety of changes which occur in connection with animal and plant life, and which are especially of interest to the physiologist, the microbiologist, the pathologist and the physician. Academically speaking, however, these phenomena all come under one head. Ambiguity will be avoided if we use the word fermentation to describe the whole process set up by the living cells, the growth and multiplication of the cells, accompanied by fermentation, and the formation of the enzymes within the cells, as well as the decomposition set up in the medium by their agency either in, around or outside the cells, while we reserve the word enzyme action to describe the individual fermentative acts, when dissociated from the living organism, or considered, even for purposes of discussion, as acting independently of the life of the cell. Thus, fermentation implies co-ordinated enzyme action, though any one or more enzyme actions may not amount to fermentation.

The chief advance in the chemistry of alcoholic fermentation, in recent years, has been made by Harden (1905) who showed that prior to its decomposition into alcohol and carbon dioxide, the molecule of sugar combines with phosphoric acid. In other words, that there is a synthesis prior to the decomposition. The work of C. Neuberg (1918) should also be mentioned, for he has succeeded in diverting the normal course of fermentation by yeast, into other channels, with the production, for example, of glycerine and acetaldehyde, the latter having been already detected and recognized as of importance in connection with the theory of fermentation.

Yeasts, bacteria and moulds are now being utilized on a commercial scale for various types of fermentation leading to the production of useful substances, as, for example, hydrogen, acetone, glycerine, as well as to obviate the use of acids in the digestion of cellulose or the "saccharification" of starch.

The technical biological side of fermentation, especially as regards its application in brewing and wine making, owes a very great deal to the work of Hansen, for it was he who applied first to the industry the methods of J. Lister and R. Koch, in order to obtain pure yeasts. For Hansen found that not only did bacteria lead to contamination in the brewery, but certain varieties of yeasts (wild yeasts) were also harmful, and it was therefore necessary to isolate pure yeasts, and begin the fermentation with these. The method has had wide application, and has revolutionized both brewing and wine making. In wine making, for example, it is now possible by a proper choice of yeast, to modify at will the bouquet of the wine.

FERMO, a town and archiepiscopal see of the Marches, Italy (anc. *Firmum Picenum*), province of Ascoli Piceno, on a hill with a fine view, 1,046 ft. above sea-level, on a branch from Porto S. Giorgio on the Adriatic coast railway. Pop. (1921) 23,304 (commune). The summit of the hill was occupied by the citadel until 1446. It is crowned by the cathedral, reconstructed in 1227 by Giorgio da Como; the fine façade and campanile of this period still remain; the beautiful rose-window over the main door dates from 1348. Against the side of the hill was built the Roman theatre; scanty traces of an amphitheatre also exist. Remains of the city wall, of rectangular blocks of limestone, may be seen just outside the Porta S. Francesco; the mediaeval battlemented walls superposed on it are picturesque. The church of S. Francesco has a good tower and choir in brickwork of 1240. Under the Dominican monastery is a very large Roman reservoir in two storeys, belonging to the imperial period, divided into many chambers, at least 24 on each level, each 30 by 20 ft., for filtration. The piazza contains the Palazzo Comunale, restored in 1446, with a statue of Pope Sixtus V. in front of it. Porto S. Giorgio has a fine castle of 1269, blocking the valley which leads to Fermo.

The ancient Firmum Picenum was founded as a Latin colony in 264 B.C., after the conquest of the Picentes, as the local headquarters of the Roman power, to which it remained faithful. It was originally governed by five quaestors. It was made a colony with full rights after the battle of Philippi, the 4th legion being settled there. It lay at the junction of roads to Pausulae, Urbs Salvia and Asculum, being connected with the coast road by a short branch road from Castellum Firmanum (Porto S. Giorgio). In the 10th century it became the capital of the *Marchia Firmiana*. In 1199 it became a free city, and remained independent until 1550, when it became subject to the papacy.

FERMOY, market town of Co. Cork, on the river Blackwater, 21 m. N.E. of Cork by road. Pop. of urban district (1926), 4,510. It is a centre for salmon and trout fishing. Trade is in flour and agricultural produce. The Glen of Araglin was once noted for its ironworks.

FERN, a name often used to denote the whole botanical class of Pteridophyta, including both the true ferns, Filicales, by far the largest group of this class in the existing flora, and the fern-like plants, Equisetales, Lycopodiales, etc. (see PTERIDOPHYTES).

FERNALD, MERRITT LYNDON (1873-), American botanist, was born at Orono, Me., on Oct. 5, 1873, and graduated at Harvard university in 1897. From 1895 to 1902 he served as assistant at the Gray herbarium, Harvard. He then became instructor and, in 1905, assistant professor, of botany. In 1915 he was made Fisher professor of natural history. Thirty seasons of active field exploration in New England, the Maritime Provinces, Quebec, Newfoundland and Labrador, made him an authority on the distribution and relationships of the flora of northeastern America, concerning which he wrote numerous botanical papers and monographs. In 1925 he published *Persistence of Plants in Unglaciated Areas of Boreal America*, a critical study demonstrating that the numerous arctic-alpine species found in unglaciated parts of the Gaspé peninsula, Magdalen islands, the Long range of Newfoundland and the Torngat mountains of Labrador, but elsewhere occurring no nearer than the Cordilleran areas of western America and the Arctic archipelago, are survivals of the pre-glacial flora of boreal America. With

B. L. Robinson he was the co-editor of the 7th edition of Gray's *New Manual of Botany* (1908).

FERNANDEZ, ALVARO, one of the leading Portuguese explorers of the earlier 15th century, the age of Henry the Navigator. He was brought up in the household of Prince Henry, and while still "young and audacious" took an important part in the discovery of "Guinea." When the great expedition of 1445 sailed for West Africa he was entrusted by his uncle, João Gonçalves Zarco, with a caravel, under injunctions to devote himself to discovery. Fernandez outstripped all other servants of the prince at this time. After visiting the mouth of the Senegal, rounding Cape Verde and landing in Goree (?), he pushed on to the "Cape of Masts" (Cabo dos Matos or Mastos, so called from its tall spindle-palms), probably between Cape Verde and the Gambia, the most southerly point till then attained. Next year (1446) he returned, and coasted on to a bay 110 leagues "south" (i.e., S.S.E.) of Cape Verde, little short of Sierra Leone. This record was not broken till 1461, when Sierra Leone was sighted and named. A wound received from a poisoned arrow compelled Fernandez to return to Portugal.

See Gomes Eannes de Azurara, *Chronica de . . . Guiné*, chs. lxxv, lxxvii.; João de Barros, *Asia*, Decade I., bk. i., chs. xiii., xiv.

FERNANDEZ, DIEGO, a Spanish adventurer and historian of the 16th century. Born at Palencia, he was educated for the church, but about 1545 he embarked for Peru, where he served in the royal army under Alonzo de Alvarado, and became chronicler of Peru. He wrote a narrative of the insurrection of Francisco Hernandez Giron, of the rebellion of Gonzalo Pizarro, and of the administration of Pedro de la Gasca. The work, *Primera y segunda parte de la Historia del Piru* (Seville, 1571), was dedicated to Philip II. It is the fullest and most authentic record existing of the events it relates.

A notice of the work will be found in W. H. Prescott's *History of the Conquest of Peru* (new ed., 1902).

FERNANDEZ, JOHN (*João, Joam*), Portuguese traveller of the 15th century. He was perhaps the earliest of modern explorers in the upland of West Africa, and a pioneer of the European slave- and gold-trade of Guinea. We first hear of him (before 1445) as a captive of the Barbary Moors in the western Mediterranean; while among these he acquired a knowledge of Arabic, and probably conceived the design of exploration in the interior of the continent whose coasts the Portuguese were now unveiling. In 1445 he volunteered to stay in Guinea and gather what information he could for Prince Henry the Navigator; with this object he accompanied Antam Gonçalves to the "River of Gold" (Rio d'Ouro, Rio de Oro) in 23° 40' N., where he landed and went inland with some native shepherds. He stayed seven months in the country, which lay just within Muslim Africa, slightly north of Pagan Negroland (West Sudan); he was taken off again by Antam Gonçalves at a point farther down the coast, near the "Cape of Ransom" (Cape Mirik), in 19° 22' 14"; and his account of his experiences proved of great interest and value, not only as to the natural features, climate, fauna and flora of the south-western Sahara, but also as to the racial affinities, language, script, religion, nomad habits and trade of its inhabitants. These people—though Mohammedans, maintaining a certain trade in slaves, gold, etc., with the Barbary coast (especially with Tunis), and classed as "Arabs," "Berbers" and "Tawny Moors"—did not then write or speak Arabic. In 1446 and 1447 John Fernandez accompanied other expeditions to the Rio d'Ouro and other parts of West Africa in the service of Prince Henry. He was personally known to Gomes Eannes de Azurara, the historian of this early period of Portuguese expansion; and from Azurara's language it is clear that Fernandez' revelation of unknown lands and races was fully appreciated at home.

See Azurara, *Chronica de . . . Guiné*, chs. xxix., xxxii., xxxiv., lxxvii., lxxviii., xc., xci., xciii.

FERNANDEZ, JUAN (fl. c. 1570), Spanish navigator and discoverer. By putting out from the coast, and so avoiding the prevailing southerly winds and gaining the help of the trade winds, he sailed from Callao to Chile in 30 days, which resulted in his arrest for sorcery. In 1563 he discovered the islands which bear

his name. He endeavoured to found a colony there, which was a failure; hence the goats which Alexander Selkirk found there. In 1574 he discovered St. Felix and St. Ambrose islands, and in 1576, in the southern ocean, he is said to have sighted Easter island, as well as a continent which, if the story, not generally accepted, is believed, was probably Australia or New Zealand.

See J. L. Arias, *Memoir recommending to the king the conversion of the new discovered islands* (in Spanish, 1609; Eng. trans. 1773); A. de Ulloa, *Relacion del Viaje*, bk. ii, ch. iv. (1748; Eng. trans. 1813); Alexander Dalrymple, *An Historical Collection of the several Voyages and Discoveries in the South Pacific Ocean* (1769-71).

FERNANDEZ, LUCAS (1474?-1542), Spanish dramatist and disciple of Encina (q.v.). He is best represented by his religious play, *Auto de la Pasión* (1514).

FERNANDINA, a city of Florida, U.S.A., 36m. N.E. of Jacksonville, on Amelia island (22m. long by $\frac{1}{2}$ to 1 $\frac{1}{2}$ m. wide); a port of entry and the county seat of Nassau county. It is served by the Seaboard Air Line railway and by steamers. The population was 3,078 in 1925 (State census), in 1930, 3,023 Federal census. The commerce of the harbour (321,84 tons in 1927, valued at \$4,797,300) consists largely of exports of phosphate rock to European ports, domestic receipts of fish and wood and domestic shipments of petroleum products, shrimp and other sea-foods. The harbour was known to the early explorers of Florida, and the island (called Guale) was continuously occupied by Europeans from 1567, when Menendez built a fort there. It has been under eight flags. When Georgia was founded Oglethorpe placed a military guard on the island, and named it Amelia. About 1762 it was noted for the large indigo plantation of Lord Egmont, and here in 1787, after Florida had been ceded back to Spain, the English settlers embarked for the West Indies. The village of Old Fernandina, about 1m. from the present city, was laid out by the Spanish in 1808. During the period of the embargo and non-importation acts preceding the war of 1812, the island was a centre for smuggling. For this reason it was invaded and Fernandina was captured by General George Matthews in 1812. In 1817 it was seized by Gregor MacGregor, a filibuster who had aided the revolting Spanish provinces of South America; and later in the same year by Louis Aury, an adventurer from Texas, who took possession in the name of the Republic of Mexico. Aury was expelled in 1818 by U.S. troops, who held Fernandina in trust for Spain until Florida was finally ceded to the United States in 1821. The Amelia island lighthouse was established in 1836. In 1861 Ft. Clinch, at the entrance to the harbour, was seized by the Confederates and was a centre of blockade-running until captured in 1862 by a Federal naval force. The city was incorporated in 1859.

FERNANDO DE NORONHA (*Fernão de N.*), an island in the South Atlantic, 125m. from the coast of Brazil to which country it belongs, in 3° 50' S., 32° 25' W. It is about 7m. long and 1 $\frac{1}{2}$ m. wide, and some other islets lie adjacent to it. Its surface is rugged, and it contains a number of rocky hills from 500 to 700ft. high, and one peak towering to the height of 1,089ft. It is formed of basalt, trachyte and phonolite, and the soil is very fertile. The climate is healthy. It is defended by forts, and serves as a place of banishment for criminals from Brazil. The next largest island of the group is about a mile in circumference, and the others are small barren rocks. The population is about 2,000, all males, including some 1,400 criminals, and a garrison of 150. Communication is maintained by steamer with Pernambuco. The island takes its name from its Portuguese discoverer (1503), the count of Noronha.

FERNANDO PO or **FERNANDO POO**, a Spanish island on the west coast of Africa, in the Bight of Biafra, about 20 m. from the mainland, in 3° 12' N. and 8° 48' E. It is of volcanic origin, related to the Cameroons system of the adjacent mainland, is the largest island in the Gulf of Guinea, is 44 m. long from N.N.E. to S.S.W., about 20 m. broad, and has an area of about 810 sq. miles. The shores are steep and rocky and the coast plain narrow. This plain is succeeded by mountain slopes which culminate in the cone of Clarence peak or Pico de Santa Isabel (9,369 ft.), in the north-central part of the island. The Misterio peak in the south is 8,600 feet. There are numerous

other peaks between 4,000 and 6,000 ft. high. The mountains contain craters and crater lakes, and are covered, most of them to their summits, with forests. Torrential streams run down the intervening valleys. The forest trees include oil palms and tree ferns, but there are many varieties, embracing ebony, mahogany and the African oak. The undergrowth is dense; it includes the sugar-cane and cotton and indigo plants. The fauna includes antelopes, monkeys, lemurs, the civet cat, porcupine, pythons and green tree-snakes, crocodiles and turtles. The mean temperature on the coast is 78° F and varies little. In the higher altitudes there is considerable daily variation. While the lowlands are very unhealthy, the climate at 2,000 ft. and above is fairly good and in the south temperate. The average annual rainfall is about 100 in.; July to October are the wettest months.

Population.—In addition to some 500 Europeans, mostly Spaniards, the pop. (1920) 23,000 consists of the Bubi or Bube (formerly also called Ediya), who occupy the interior, and the coast dwellers, a mixed race, descended from negro slaves, or free negroes who settled in the island, with a strong admixture of Portuguese and Spanish blood, and known to the Bubi as "Portos"—a corruption of Portuguese. The Bubi are of Bantu stock and early immigrants from the mainland. Physically they are a finely developed race, light brown in colour. They are extremely jealous of their independence and unwilling to take service with Europeans. In their primitive condition they are found only in the south, their chief settlement being in the Moka plateau. They wear very little clothing, but adorn wrists and ankles with bangles made of ivory, shells, beads or grass. They use wooden weapons but stone axes and knives were in use as late as 1858. Their villages are built in the hills; their houses are rectangular, with numerous fireplaces and sometimes with three or four doors. They make good pottery. Hunters and fishers, the Bubi are also fair agriculturalists. Owing however to in-breeding, an addiction to strong wines, and the ravages of sleeping sickness the Bubi are slowly dying out. The staple foods generally are millet, rice, yams and bananas.

The principal settlement is Santa Isabel, otherwise known as Port Clarence (pop. 1,400), a safe and commodious harbour on the north coast.

In Santa Isabel resides the governor of Spanish Guinea, as the Spanish islands in the Gulf of Guinea and, on the mainland, the Muni River settlement, are collectively called. In its graveyard are buried Richard Lander and several other explorers of West Africa. The chief industry until the close of the 19th century was the collection of palm oil; since then cocoa has become the main product for export.

History.—The island was discovered towards the close of the 15th century by a Portuguese navigator called Fernão Po, who, struck by its beauty, named it Formosa, but it soon came to be called by the name of its discoverer, though some authorities maintain that another Portuguese seaman, Lopes Gonsalves, was before him. The years 1469, 1471 and 1486 are variously given as those of the date of the discovery. A Portuguese colony was established in the island, which together with Annobon was ceded to Spain in 1778. The first attempts of Spain to develop the island failed and in 1827, with the consent of Spain, the administration was taken over by Great Britain, the British "superintendent" having a Spanish commission as governor. By the British Fernando Po was used as a naval station for the ships engaged in the suppression of the slave trade. The British headquarters were named Port Clarence and the adjacent promontory Cape William, in honour of the duke of Clarence (William IV.). In 1844 the Spaniards reclaimed the island, refusing to sell their rights to Great Britain. They hoisted the Spanish flag, appointing a British resident, John Beecroft, governor. During the British occupation a considerable number of Sierra Leonians, West Indians and freed slaves settled in the island, and English became and remains the common speech of the coast peoples. In 1858 a Spanish governor was sent out, and the Baptist missionaries who had laboured in the island since 1843 were compelled to withdraw. The Jesuits who succeeded the Baptists were also expelled, but mission and educational work is now carried on

by other Roman Catholic agencies, and (since 1870) by the Primitive Methodists. In 1879 the Spanish government recalled its officials, but a few years later when the partition of Africa was being effected, they were replaced and a number of Cuban political prisoners were deported thither. Very little was done to develop the resources of the island until after the loss of the Spanish colonies in the West Indies and the Pacific, when Spain turned her attention to her African possessions. Cocoa plantations were started. In 1900 the Spaniards gave France, in return for territorial concessions on the mainland, the right of pre-emption over the island and her other West African possessions.

The administration of the island is in the hands of a governor-general, assisted by a council, and responsible to the Dirección General de Colonias y Protectorados, a department in the Presidencia del Consejo (Prime Minister's Office) at Madrid. The governor-general has under his authority the sub-governors of the other Spanish possessions in the Gulf of Guinea, namely, the Muni River Settlement, Corisco and Annobon (*qq.v.*). None of these possessions is self-supporting. The metropolis contributes two and a half million pesetas (£100,000) p.a. to their expenses. In 1926 a special credit of 26,000,000 pesetas was set aside to develop the resources of the islands' and mainland territories, to be spent in a period of ten years. The programme includes the construction of roads, harbours, hospitals, schools, health organization, telephones and telegraphs and an agricultural school with model farms.

Clarke, *The Adeeyah Vocabulary* (1841), and *Introduction to the Fernandian Tongue* (1848). Consult also *Wanderings in West Africa* (1863) and other books by Sir Richard Burton, who was consul at Fernando Po in the years 1861-65.

FERNIE, a town in the east Kootenay district of British Columbia. Pop. (1921) 4,343. It is on the Crow's Nest branch of the Canadian Pacific railway and on the Canadian National railway at the junction of Coal Creek with the Elk river, and has extensive coal mines. There are about 500 coke ovens, sawmills, railway shops, a brewery, a foundry, machine shops, etc.

FEROZEPUR or **FIROZPUR**, a town and district of British India, in the Punjab. The town is a railway junction, and is situated about 4 m. from the present south bank of the Sutlej. Pop. (1921) 54,351. The arsenal is the largest in India, and Ferozepur is the headquarters of a brigade. British rule was first established at Ferozepur in 1835, when, on the failure of heirs to the Sikh family who possessed it, a small territory 86 m. in extent became an escheat to the British government, and the present district has been gradually formed around this nucleus. The strategic importance of Ferozepur was at this time very great; and when, in 1839, Captain (afterwards Sir Henry) Lawrence took charge of the station as political officer, it was the outpost of British India in the direction of the Sikh power. Ferozepur accordingly became the scene of operations during the first Sikh War. The Sikhs crossed the Sutlej in December 1845, and were defeated successively at Mudki, Ferozeshah, Aliwal and Sobraon, after which they withdrew into their own territory, and peace was concluded at Lahore. At the time of the Mutiny an unsuccessful attempt was made to seize the magazine, which was held by the Europeans.

Ferozepur has rapidly advanced in material prosperity of late years, and is now a very important seat of commerce, trade being mainly in grain.

The DISTRICT OF FEROZEPUR comprises an area of 4,286 sq.m. and had in 1921 a population of 1,098,248. The surface is level, with the exception of a few sand-hills in the south and south-east. The country consists of two distinct tracts, that liable to annual

fertilizing inundations from the Sutlej, and the upland tract. The only river is the Sutlej, which runs along the north-western boundary. The principal crops are wheat, barley, millet, gram, pulses, oil-seeds, cotton, tobacco, etc. The other important towns and seats of commerce are Fazilka (pop. 13,829), Dharmkot (5,560), Moga (14,145), and Muktsar (10,539). Owing principally to the dryness of its climate, Ferozepur has the reputation of being an exceptionally healthy district. In September and October, however, after the annual rains, the people suffer a good deal from remittent fever. The district is watered by the Sirhind canal and by canals from the Sutlej; known as the Grey canals from their original founder Col. Grey. These latter have now been merged in the Lower Sutlej Irrigation Scheme.

FEROZESHAH, a village in the Punjab, India, notable as the scene of one of the chief battles in the first Sikh War. The battle immediately succeeded that of Mudki, and was fought on Dec. 21 and 22, 1845. During its course Sir Hugh Gough, the British commander, was over-ruled by the governor-general, Lord Hardinge, who was acting as his second in command. (*See SIKH WARS.*) At the end of the first day's fighting the British had occupied the Sikh position, but had not gained an undisputed victory. On the following morning the battle was resumed, and the Sikhs were reinforced by a second army under Tej Singh; but through cowardice or treachery Tej Singh withdrew at the critical moment, leaving the field to the British. In the course of the fight the British lost 694 killed and 1,721 wounded, the vast majority being British troops, while the Sikhs lost 100 guns and about 5,000 killed and wounded.

FERRABOSCO or **FERABOSCO**, the name of a family of musicians of Italian origin settled in England in the 16th century. The father, DOMENICO MARIA (1513-1574) was choirmaster at Bologna and at the Basilica Vaticana, Rome, and then a singer in the Papal chapel. He wrote madrigals and motets.

His son ALFONSO (d. 1588), madrigalist, settled in England before 1567, when he received a pension from the Queen, and became intimate with William Byrd. He returned to Italy in later life, and died at Turin. His madrigals were printed at Venice in 1587. He was highly esteemed in England, and Peacham, in his *Compleat Gentleman*, says that "in judgment and depth of skill he was inferior unto none." Many of his madrigals and motets found their way into English collections, such as Yonge's *Musica Transalpina*, Leighton's *Teares and Lamentacions*.

His son ALFONSO (d. 1628) lutanist and composer, was born and died at Greenwich. He was one of the king's musicians for the violin under James I. He wrote the music for five masques by his friend Ben Jonson between 1605 and 1609. He was music master to Prince Henry and then to Prince Charles (Charles I.), and, when Charles came to the throne, became "composer of the king's music." He published a book of *Ayres* (1609), containing songs written for Jonson's masques, and *Lessons for 1, 2 and 3 viols* (1609).

His son, also named ALFONSO (d. c. 1660), succeeded (1628) his father as a viol player in the king's band. He and his brother Henry jointly held the post of musician in ordinary to the king. Both the brothers died before July 4, 1661. John Ferrabosco, organist at Ely cathedral, who died in 1682, belonged to the same family.

FERRAR, NICHOLAS (1592-1637), English theologian, was born in London in 1592 and educated at Clare Hall, Cambridge, graduating in 1610. In 1618 he became actively connected with the Virginia Company. When, in 1623, it was deprived of its patent, he entered parliament, but, soon deciding to devote himself to a religious life, he purchased the manor of Little Gidding, Huntingdonshire, where he organized a small religious community. Here, in 1626, Ferrar was ordained a deacon by Laud, and declining preferment, he lived an austere, almost monastic life of study and good works. He died on Dec. 4, 1637, and the house was despoiled and the community broken up ten years later. There are extant a number of "harmonies" of the Gospel, printed and bound by the community, two of them by Ferrar himself. One of the latter was made for Charles I. on his request, after a visit in 1633 to see the "Arminian Nunnery at Little Gid-

ding." Little Gidding is described in Shorthouse's *John Inglesant*.

FERRAR, ROBERT (c. 1500–1555), bishop of St. David's and martyr, born of a Yorkshire family, is said to have studied both at Cambridge and Oxford before he became a canon regular of St. Augustine. He accompanied Bishop Barlow on his embassy to Scotland in 1535 and became prior of St. Oswald's at Nostell, near Pontefract. At the dissolution of the monasteries he married and is said to have been Cranmer's chaplain. In the reign of Edward VI., Ferrar enjoyed high favour and was made (1548) bishop of St. David's, where he had much trouble with his chapter. He had some differences with the King's Council; the complaints of the chapter were therefore listened to and the bishop was summoned to London to answer a charge of *praemunire* and imprisoned.

As soon as the heresy laws were re-established under Mary, Ferrar was sent down to be tried by his successor at St. David's. He was burnt at the stake at Carmarthen on March 30, 1555.

See the admirable and exhaustive article by T. F. Tout in the *Dict. Nat. Biog.*

FERRARA, a city and archiepiscopal see of Emilia, Italy, capital of the province of Ferrara, 30 m. N.N.E. of Bologna, situated 30 ft. above sea-level on the Po di Vomano, a branch channel of the main stream of the Po, which is $3\frac{1}{2}$ m. N. Pop. (1921) 65,022 (town), 107,618 (commune). The town has broad streets and numerous palaces, which date from the 16th century, when it was the seat of the court of the house of Este, and had, it is said, 100,000 inhabitants.

The most prominent building is the square castle of the house of Este, in the centre of the town, a brick building surrounded by a moat, with four towers. It was built after 1385 and partly restored in 1554–1570; the pavilions on the top of the towers date from the latter year. Near it is the hospital of S. Anna, where Tasso was confined during his attack of insanity (1579–1586). The Palazzo del Municipio, rebuilt in the 18th century, was the earlier residence of the Este family. Close by is the cathedral of S. Giorgio, consecrated in 1135, when the Romanesque lower part of the main façade and the side façades were completed. It was built by Guglielmo degli Adelardi (d. 1146), who is buried in it. The upper part of the main façade, with arcades of pointed arches, dates from the 13th century, and the portal has recumbent lines and elaborate sculptures above. The interior was restored in the baroque style in 1712–18. The campanile, in the Renaissance style, dates from 1451–93. Opposite the cathedral is the Gothic Palazzo della Ragione, in brick (1315–1326), now the law-courts. A little way off is the free university. It has faculties of law, medicine and natural science (with 204 students in all); the library has valuable MSS., including part of that of the *Orlando Furioso* and letters by Tasso. Of the other churches S. Francesco, S. Benedetto, and S. Maria in Vado are all good early Renaissance buildings. The numerous early Renaissance palaces, often with good terra-cotta decorations, form quite a feature of Ferrara; few towns of Italy have so many of them though they are mostly comparatively small in size. Among them may be noted those in the N. quarter (especially the four at the intersection of its two main streets), which was added by the duke, Ercole I. in 1492–1505, from the plans of Biagio Rossetti. The finest of these is the Palazzo de' Diamanti, so called from the diamond points into which the blocks of stone with which it is faced are cut. It contains the municipal picture gallery, with a large number of pictures of artists of the school of Ferrara. To the later 15th century are due famous frescoes in the Palazzo Schifanoia, built by the Este family. The simple house of Ariosto, in which he died in 1532, lies farther west. The best 16th century masters of the Ferrara school were Lorenzo Costa (1460–1535), and Dosso Dossi (1479–1542), the most eminent of all.

The origin of Ferrara is uncertain, and probabilities are against the supposition that it occupies the site of the ancient Forum Alieni. It was probably a settlement formed by the inhabitants of the lagoons at the mouth of the Po. It appears first in a document of Aistulf of 753 or 754 as a city in the exarchate of Ravenna. After 984 we find it a fief of Tedaldo, count of Modena and Canossa, nephew of the emperor Otho I. It after-

wards made itself independent, and in 1101 was taken by siege by the countess Matilda. At this time it was mainly dominated by several great families, among them the Adelardi.

In 1146 the property of Guglielmo Adelardi passed, as the dowry of his niece Marchesella, to Azzolino d'Este. After considerable struggles Azzo Novello was nominated perpetual podestà in 1242; in 1259 he took Ezzelino of Verona prisoner in battle. His grandson, Obizzo II. (1264–1293), succeeded him, and the pope nominated him captain-general and defender of the states of the Church; and the house of Este was from henceforth settled in Ferrara. Borso received the fiefs of Modena and Reggio from the emperor Frederick III. as first duke in 1452 (in which year Girolamo Savonarola was born here), and in 1470 was made duke of Ferrara by Pope Paul II. Ercole I. (1471–1505) and his son Alfonso I. (m. Lucrezia Borgia) carried on war with Venice. In 1509 he was excommunicated by Julius II., and attacked the pontifical army in 1512 outside Ravenna, which he took. Gaston de Foix (q.v.) fell in the battle. With the succeeding popes Alfonso was able to make peace. He was the patron of Ariosto from 1518 onwards. His son Ercole II. (duke, 1534–59) married Renata, daughter of Louis XII. of France. His son Alfonso II. married Barbara, sister of the emperor Maximilian II. He raised the glory of Ferrara to its highest point, and was the patron of Tasso and Guarini, favouring, as the princes of his house had always done, the arts and sciences. For its majolica see CERAMICS. He had no legitimate male heir, and in 1597 Ferrara was claimed as a vacant fief by Pope Clement VIII. The town remained a part of the states of the Church, the fortress being occupied by an Austrian garrison from 1832 until 1859, when it became part of the kingdom of Italy.

A considerable area within the walls of Ferrara is unoccupied by buildings, especially on the north, where the handsome Renaissance church of S. Cristoforo, with the cemetery, stands; but modern times have brought a renewal of industrial activity. Knitted goods and shawls are made. Ferrara is on the main line from Bologna to Padua and Venice, and has branches to Ravenna, Poggio Rusco (for Suzzara), Cento and Comacchio. At Pontelagoscuro, which is within the commune of Ferrara, is a railway bridge over the Po and a large soap and candle factory.

See G. Agnelli, *Ferrara e Pomposa* (Bergamo, 1902); E. G. Gardner, *Dukes and Poets of Ferrara* (London, 1904); K. Chledowski, *Der Hof von Ferrara* (1919), Arti Grafiche.

FERRARA-FLORENCE, COUNCIL OF. The council of Ferrara and Florence was the culmination of a series of futile mediaeval attempts to reunite the Greek and Roman churches. The emperor, John VI. Palaeologus, had been advised by his experienced father to avoid all serious negotiations, as they had invariably resulted in increased bitterness; but John, in view of the rapid dismemberment of his empire by the Turks, felt constrained to seek a union. The situation was, however, complicated by the strife which broke out between the pope (Eugenius IV.) and the oecumenical council of Basel. Both sides sent embassies to the emperor at Constantinople, as both saw the importance of gaining the recognition and support of the East, for on this practically depended the victory in the struggle between papacy and council for the supreme jurisdiction over the church (see BASEL, COUNCIL OF). The Greeks, fearing the domination of the papacy, were at first more favourably inclined toward the conciliar party; but the astute diplomacy of the Roman representatives, who have been charged by certain Greek writers with the skilful use of money and of lies, won over the emperor. With a retinue of about 700 persons, entertained in Italy at the pope's expense, he reached Ferrara early in March 1438, and in the following month the Union Synod was solemnly inaugurated on the 9th of April 1438. After several months of negotiation, it seemed for several reasons advisable to transfer the council to Florence. There ensued long debates and negotiations on the *filioque*, in which Markos Eugenikos, archbishop of Ephesus, spoke for the irreconcilables; but the Greeks under the leadership of Bessarion, archbishop of Nicaea, and Isidor, metropolitan of Kiev, at length made a declaration on the *filioque* (4th of June), to which all save Markos Eugenikos subscribed. On the next topic of importance, the

primacy of the pope, the project of union nearly suffered shipwreck; but here a vague formula was finally constructed which, while acknowledging the pope's right to govern the church, attempted to safeguard as well the rights of the patriarchs. On the basis of the above-mentioned agreements, as well as of minor discussions as to purgatory and the Eucharist, the decree of union was drawn up in Latin and in Greek, and signed on the 5th of July by the pope and the Greek emperor, and all the members of the synod save Eugenikos and one Greek bishop who had fled; and on the following day it was solemnly published in the cathedral of Florence.

The council, however, desirous of negotiating unions with the minor churches of the East, remained in session for several years, and seems never to have reached a formal adjournment. The decree for the Armenians was published on the 22nd of November 1439; they accepted the *filioque* and the Athanasian creed, rejected Monophysitism and Monothelitism, agreed to the developed scholastic doctrine concerning the seven sacraments, and conformed their calendar to the Western in certain points. On the 26th of April 1441 the pope announced that the synod would be transferred to the Lateran; but before leaving Florence a union was negotiated with the Oriental Christians known as Jacobites. The *Decretum pro Jacobitis*, published on the 4th of February 1442, is, like that for the Armenians, of high dogmatic interest, as it summarizes the doctrine of the great mediaeval scholastics on the points in controversy. The decree for the Syrians, published at the Lateran on the 30th of September 1444, and those for the Chaldeans (Nestorians) and the Maronites (Monothelites), published at the last known session of the council on the 7th of August 1445, added nothing of doctrinal importance. Though the direct results of these unions were the restoration of prestige to the absolutist papacy and the bringing of Byzantine men of letters, like Bessarion, to the West, the outcome was on the whole disappointing. Of the complicated history of the "United" churches of the East it suffices to say that Rome succeeded in securing but fragments, though important fragments, of the greater organizations. As for the Greeks, the union met with much opposition, particularly from the monks, and was rejected by three Oriental patriarchs at a synod of Jerusalem in 1443; and after various ineffective attempts to enforce it, the fall of Constantinople in 1453 put an end to the endeavour. As Turkish interests demanded the isolation of the Oriental Christians from their western brethren, and as the orthodox Greek nationalists feared Latinization more than Mohammedan rule, a patriarch hostile to the union was chosen, and a synod of Constantinople in 1472 formally rejected the decisions of Florence.

Creighton, *History of the Papacy during the Period of the Reformation*, vol. ii. 173 sqq. and the general Church Histories under reference to the Greek Church.

FERRARI, GAUDENZIO (c. 1480–1546), Italian painter of the Lombard school, was born at Valduggia, Piedmont, then in the duchy of Milan. His mother was a member of the Vincio family of Varallo, and her name is used in the signatures of his early works. Lomazzo, who must have been a lad at the time of Gaudenzio's death, and who as a pupil of one of Gaudenzio's pupils was certainly well informed, says that he studied at Milan under Stefano Scotto, a painter of whom little is known, and then under Bernardino Luini. He was also influenced by Bramantino. Before going to Milan he may have studied at Vercelli, which seems to have been an artistic centre of followers of the original Lombard school, who here continued in their local traditions, while Leonardo da Vinci's influence was revolutionizing art at Milan. Although Gaudenzio is not so well known as other masters of the Italian Renaissance, and has not received the appreciation which he deserved owing to the circumstance that his chief work was executed in fresco in remote country districts, he was undoubtedly the leading artist of the Lombard-Piedmontese school. Giovanni Morelli says of him: "He does not possess the charm of Luini, neither is his work so finished, but he occupied a far higher place in all that regards invention, dramatic life and pic-

torial gift. He loses his equilibrium sometimes owing to his fiery temperament and becomes affected and baroque; his large compositions are often overcrowded with figures; at his best, however, he need not fear comparison with even Raphael." Lomazzo went so far as to place him seventh among the chief painters of Italy.

His early work was done chiefly at Varallo, where he painted frescoes in the chapel of St. Margaret in the church of Santa Maria delle Grazie (c. 1508), and a screen across that church representing 21 scenes from "the Life of Christ" (1513). He also undertook the decoration of the chapels which were being built on the Sacro Monte, a task which occupied him at intervals for many years. In 1510 and 1511 he painted an ancona for the church of Santa Maria at Arona, in 1514 he worked at Novara on the altarpiece of San Gaudenzio, which established his fame, and secured him further commissions at Novara and Morbegno. In 1528 he settled at Vercelli and there painted for the church of St. Christopher an altarpiece (1529) and frescoes representing scenes from "the Life of St. Mary Magdalene" (1530 to 1532) and from "the Life of the Virgin" (1532–34). In 1535 he was at Saronno decorating the cupola of the church of Santa Maria dei Miracoli with the fresco of "a Choir of Angels." After spending two more years at Varallo, he went to Milan in 1539 where he painted various frescoes in the churches of Santa Maria delle Grazie, della Passione, etc. He died in Milan on Jan. 31, 1546. During the last period he employed as assistants Bernardino Lanino, Fermo Stella, G. B. della Cerva. G. Giovenone was one of his pupils. Gaudenzio combined painting and modelling to a certain extent by the use of gesso in his early frescoes to represent metal in armour and trappings. In his decorations for the chapels of the Sacro Monte at Varallo he made an ambitious attempt to wield the two arts with one intention by placing coloured terra cotta groups against a frescoed background. Further important works of the master, who was a prolific worker, are to be found in the national collections of London, Paris, Berlin, Milan, Turin and Bergamo, in the cathedrals of Como and Casale Monferrato, and in the churches of Bergamo, Bellagio, Buto Arsizio and Canobbio; and the fine "Nativity" of Dorchester house, sold at Christie's auction rooms. A good many of Gaudenzio's drawings and cartoons are to be found in the Royal library at Turin and the Biblioteca Albertina.

FERRARI, GIUSEPPE (1812–1876), Italian philosopher, historian and politician, was born at Milan on March 7, 1812, and died in Rome on July 2, 1876. After studying law at Pavia, he edited the works of Vico, prefaced by an appreciation (1835). He then went to France and, in 1839, produced his *Vico ed l'Italie*, followed by *La Nouvelle Religion de Campanella* and *La Théorie de l'erreur*. In 1840 he was made professor of philosophy at Rochefort, and in 1842 was transferred to Strasbourg. Owing to trouble with the clergy, he returned to Paris and published *Idées sur la politique de Platon et d'Aristote*, a defence of his theories. From 1849 to 1858 he devoted himself exclusively to writing, publishing *Les Philosophes Salariés*, *Machiavel juge des révolutions de notre temps* (1849), *La Federazione repubblicana* (1851), *La Filosofia della rivoluzione* (1851), *L'Italia dopo il colpo di Stato* (1852), *Histoire des révolutions, ou Guelfes et Gibelins* (1858; Ital. trans., 1871–73). In 1859 he returned to Italy, opposed Cavour, and upheld federalism against the policy of a single Italian monarchy. He held chairs of philosophy at Turin, Milan and Rome, and was made senator in May 1876. His other works include *Histoire de la raison d'état*, *La China e l'Europa*, *Corso d'istoria degli scrittori politici italiani*. A sceptic and phenomenalist in philosophy, a revolutionist in politics, Ferrari was admired as an orator and as a writer.

See Marro Macchi, *Annuario storico italiano* (Milan, 1877); A. Mazzoleni, *Giuseppe Ferrari* (Milan, 1877); C. Werner, *Die ital. Philosophie des 19. Jahrh.* vol. 3 (Vienna, 1885); P. Nicoli, *La Mente di G. Ferrari* (1902); *Le Più Belle Pagine di G. Ferrari* (Milan, 1927).

FERRARI, PAOLO (1822-1889), Italian dramatist, was born at Modena on April 5, 1822. In 1852 he made his reputation as a playwright with *Goldoni e le sue sedici commedie*. Among numerous later plays his comedy *Parini e la satira* (1857) had great success. Ferrari may be regarded as a follower of Goldoni and was a brilliant master of stagecraft. He died on March 9, 1889, at Milan. His collected plays were published in 1877-80.

See N. de Bellis, *Il Teatro di Paolo Ferrari Saggio critico* (1922); P. C. Ferrigni, *Il Teatro di Paolo Ferrari nella critica di Yorick* (Milan, 1922).

FERRÉ, CHARLES THÉOPHILE (1845-1871), chief of police of the Paris Commune, was until March 1871 one of the lesser known followers of L. A. Blanqui (q.v.). He was elected to the Commune for the 18th arrondissement, polling the very high figure of 13,784 votes. Together with Raoul Rigault, a man as young as himself, he was placed in charge of the police. Like Marat of the French Revolution, Ferré of the Commune has been invested with the reputation of a monster of terrorism. The department of the police was not, indeed, very wisely run; arrests were made widely, haphazardly and clumsily, but the Commune was at least protected from internal trouble. Ferré always supported the most violent motions, in particular (after the shooting of Duval) a motion declaring that the hostages in the hands of the Commune would be executed if the Government troops killed any more Communard prisoners. This decree was not carried out until after the Government troops had broken into Paris, when, ascertaining that they were now again shooting Communard prisoners, Ferré ordered the execution of the hostages, including Archbishop Darboy. At his trial before the court-martial he defended his action and defied the court. He was shot at Satory on Nov. 28, 1871.

See P. Larousse, *Dictionnaire du XIX^e siècle*, s.v. "Ferré" (1872); G. Da Costa, *La Commune Vécue* (1901); R. W. Postgate, *Out of the Past* (1922); A. Dayot, *La Guerre, La Siège, La Commune d'après les peintures, gravures, photographies, sculptures, médailles, autographes, et objets du temps* (1901). (See also COMMUNE.)

FERREIRA, ANTONIO (1528-1569), Portuguese poet, was a native of Lisbon; his father was employed in the house of the duke of Coimbra at Setubal, and the poet was educated at the University of Coimbra, where he eventually became a professor. The sonnets forming the First Book in his collected works date from 1552 and contain the history of his early love for an unknown lady. The sonnets in the Second Book were inspired by D. Maria Pimentel, whom he afterwards married, and they are marked by that chastity of sentiment, seriousness and ardent patriotism which characterized the man and the writer. He was intimate with princes, nobles and the most distinguished literary men of the time, and became the foremost representative of the classical school. On Oct. 14, 1567 he became *Disembargador da Casa do Cível*, and had to leave the quiet of Coimbra for Lisbon. His verses tell how he disliked the change, and how the bustle of the capital, then a great commercial emporium, made him sad and almost tongue-tied for poetry. He died of plague in Lisbon on Nov. 29, 1569, having stayed there doing his duty when others fled.

Horace was his favourite poet and his admiration of the classics made him disdain the popular poetry of the Old School (*Escola Velha*) represented by Gil Vicente. His national feeling would not allow him to write in Latin or Spanish, like most of his contemporaries, but his Portuguese is as Latinized as he could make it, and he even calls his poetical works *Poemas Lusitanos*. Ferreira wrote the Terentian prose comedy, *Bristo*, at the age of 25 (1553), and dedicated it to Prince John in the name of the university. It is neither a comedy of character nor manners, but its *vis comica* lies in its plot and situations. The *Cioso*, a later product, may almost be called a comedy of character. *Castro* is Ferreira's most considerable work, and, in date, is the first tragedy in Portuguese, and the second in modern European literature.

The *Castro* was first printed in Lisbon in 1587, and it is included in Ferreira's *Poemas*, published in 1598 by his son. It has been translated by Musgrave (1825), and the chorus of Act I. appeared again in English in the *Savoy* for July 1896. It has been done into French and German. The *Bristo* and *Cioso* first appeared with the comedies

of Sá de Miranda in 1622. There is a good modern edition of the Complete Works of Ferreira (2 vols., Paris, 1865). See Castilho, *Antonio Ferreira* (3 vols., Rio, 1865), which contains a full biographical and critical study with extracts.

FERREL'S LAW is to the effect that "If a body moves in any direction on the earth's surface, there is a deflecting force arising from the earth's rotation, which deflects it to the right in the northern hemisphere and to the left in the southern hemisphere." This law was enunciated by William Ferrel, an American scientist, who was responsible for a number of papers, of which his *Essay on Winds and Currents of the Ocean* (1856) is probably the best known. (See METEOROLOGY.)

FERRERO, GUGLIELMO (1871-), Italian journalist and author, was born at Portici, near Naples on July 31, 1871. At an early age he joined the staff of the Radical semi-republican *Secolo* of Milan. He travelled abroad considerably, and made a reputation by his books *L'Europa giovane* (1897) and *Il Militarismo* (1898; Engl. tr., 1902). Later he studied Roman history, and in 1902 published his *Grandezza e decadenza di Roma*, which established his fame as historian among the general public rather than among scholars. In politics a Radical Democrat, on the outbreak of the World War he was an ardent supporter of the Allied cause, which he identified with that of democracy, and advocated Italian intervention. After the war he published numerous articles and several books in Italy and abroad, inspired by forebodings of imminent catastrophe for Italy and the world. Among these is *Da Fiume a Roma* (1923), also published in English under the title *Four Years of Fascism* (1924).

FERRERS, the name of a great Norman-English feudal house, derived from Ferrières-St.-Hilaire, to the south of Bernay, in Normandy. Its ancestor Walkelin was slain in a feud during the Conqueror's minority, leaving a son Henry, who took part in the Conquest and held a great fief in the midlands. He established his chief seat at Tutbury Castle, Staffordshire, on the Derbyshire border, and founded there a Cluniac priory. His eldest son succeeded to Ferrières, and, according to Stapleton, he was ancestor of the Oakham house of Ferrers, whose memory is preserved by the horseshoes hanging in the hall of their castle. Robert, a younger son of Henry, inherited his vast English fief, and, for his services at the battle of the Standard (1138), was created earl of Derby by Stephen. He appears to have died the next year.

The earls seem to have been styled indifferently earls of Derby or Nottingham (both counties then forming one shrievalty) or of Tutbury, or simply (de) Ferrers.

William, the 3rd earl, joined in the great revolt of 1173, when he fortified his castles of Tutbury and Duffield and plundered Nottingham, which was held for the king. On his subsequent submission his castles were razed. He died at the siege of Acre, 1190. His son William, the 4th earl, attacked Nottingham on Richard's behalf in 1194. He was confirmed by king John in the earldom of Derby, 1199. With his brother-in-law the earl of Chester, and with William Marshal, earl of Pembroke, whose daughter married his son, he acted in securing the succession of the young Henry, joining in the siege of Mountsorrel and the battle of Lincoln. In 1227 he was one of the earls who rose against Henry III. on behalf of his brother Richard and made him restore the forest charters, and in 1237 he was one of the three counsellors forced on the king by the barons. He died in 1247.

Robert, 6th and last earl, his grandson, succeeded as a minor in 1254. He was one of the five earls summoned to Simon de Montfort's parliament, though, on taking the earl of Gloucester's part, he was arrested by Simon. On the king's triumph, he was compelled to forfeit his castles and seven years' revenues. In 1266 he revolted on his own estates in Derbyshire, but was defeated at Chesterfield by Henry "of Almain," deprived of his earldom and lands and imprisoned. In 1269, he agreed to pay £50,000 for restoration, and to pledge all his lands save Chartley and Holbrook for its payment. As he was not able to find the money, the lands passed to the king's son, Edmund.

The earl's son John succeeded to Chartley, a Staffordshire estate long famous for the wild cattle in its chase, and was summoned

as a baron in 1299, though he had joined the baronial opposition in 1297. On the death, in 1450, of the last Ferrers lord of Chartley, the barony passed with his daughter to the Devereux family and then to the Shirleys, one of whom was created Earl Ferrers in 1711. The barony has been in abeyance since 1855.

The line of Ferrers of Groby was founded by William, younger brother of the last earl, who inherited from his mother Margaret de Quinci her estate of Groby in Leicestershire, and some Ferrers manors from his father. On the death of William, Lord Ferrers of Groby, in 1445, the barony passed with his granddaughter to the Grey family and was forfeited with the dukedom of Suffolk in 1554. A younger son of William, the last lord, married the heiress of Tamworth Castle, and his line was seated at Tamworth till 1680, when an heiress carried it to a son of the first Earl Ferrers. From Sir Henry, a younger son of the first Ferrers of Tamworth, descended Ferrers of Baddesley Clinton, seated there in the male line till towards the end of the 19th century. The line of Ferrers of Wemme was founded by a younger son of Lord Ferrers of Chartley, who married the heiress of Wemme, Co. Salop, and was summoned as a baron in her right; but it ended with their son.

Higham Ferrers, Northants, and Woodham Ferrers, Essex, take their names from this family. It has been alleged that they bore horseshoes for their arms in allusion to Ferrières (*i.e.*, iron-works); but when and why they were added to their coat is a moot point.

See Dugdale's *Baronage*; J. R. Planché's *The Conqueror and his Companions*; G. E. C(okayne)'s *Complete Peerage*; *Chronicles and Memorials* (Rolls Series); T. Stapleton's *Rotuli Scaccarii Normannie*; H. Norris, *Baddesley Clinton, with account of the family of Ferrers* (1897).

FERRERS, LAURENCE SHIRLEY, 4TH EARL (1720–1760), the last nobleman in England to suffer a felon's death, was born on Aug. 18, 1720. In 1758 his wife obtained a separation from him for cruelty. The Ferrers estates were then vested in trustees, an old family steward, Johnson, being appointed receiver of rents. On Jan. 18, 1760, Johnson called at the earl's mansion at Staunton Harold, Leicestershire, when Lord Ferrers shot him. Ferrers was tried for murder by his peers in Westminster Hall. He pleaded insanity, but was found guilty. On May 5, 1760, dressed in a light-coloured suit, embroidered with silver, he was taken in his own carriage from the Tower of London to Tyburn and there hanged. It has been said that as a concession to his order the rope used was of silk.

See Peter Burke, *Celebrated Trials connected with the Aristocracy in the Relations of Private Life* (London, 1849); Edward Walford, *Tales of our Great Families* (London, 1877); Howell's *State Trials* (1816), xix. 885–980.

FERRER Y GUARDIA, FRANCISCO (1859–1909), Spanish educationist, was born at Abella, and was originally a railwayman. After the collapse of the Spanish republic he went to Paris in 1886 and became converted to Socialism. About 1899 a legacy enabled him to return to Spain and propagate his views. He was especially keen on substituting secular for clerical education, and it was through this, and through his own school, the Escuela Moderna in Barcelona, that he became an international figure. Among those employed at his school was Morral, and Ferrer was in 1906 charged with complicity in his attempt to assassinate the king. After he had been imprisoned for a year the charge was dismissed. On Sept. 1, 1909, he was again arrested and charged, despite his opposition to violence, with complicity in the outbreak at Barcelona in the previous July. He was sentenced to death by court martial on Sept. 12 and shot on Sept. 13. The methods of the court and the character of the evidence admitted gave rise to an international agitation of protest. The execution was widely regarded as a judicial murder. In 1912 the Spanish supreme military council admitted that, contrary to the evidence offered at the trial, no act of violence could be traced to Ferrer, and ordered the restoration of his property.

See Prof. Simarro, *El Proceso Ferrer*, and Francisco Ferrer, *The Modern School* (Eng. trans. 1913).

FERRET, a domesticated breed of the wild polecat (*Putorius fœtidus*), which it resembles in size, form and habits, and with which it interbreeds. It differs in the colour of its fur, which is

usually yellowish-white, and of its eyes, which are pinky-red. The "polecat-ferret" is a brown breed, apparently the product of the above-mentioned cross. The ferret attains a length of about 14 in., exclusive of the tail, which measures 5 in. It is employed in destroying rats and other vermin, and in driving rabbits from their burrows. The ferret is remarkably prolific, the female bringing forth two broods annually, each numbering from six to nine young. Pliny states it was employed in his time in rabbit-hunting.

The ferret should be kept in dry, clean, well-ventilated hutches, and fed twice daily on bread, milk, and meat, such as rabbits' and fowls' livers. When used to hunt rabbits it is provided with a muzzle or with a cope, made by looping and knotting twine about the head and snout, in order to prevent it killing its quarry. As the ferret enters the hole, the rabbits flee before it, and are shot as they break ground. A ferret's hold on its quarry is as obstinate as that of a bulldog, but can easily be broken by pressure of the thumb just above the eyes. Only full-grown ferrets are "worked to" rats. Several are used at a time and without copes, as rats are fierce fighters.

See N. Everitt, *Ferrets* (1897).

FERRI, CIRO (1634–1689), Roman painter, the chief disciple and successor of Pietro da Cortona. He was born in the Roman territory. At an age a little past 30, he completed the painting of the ceilings and other internal decorations begun by his instructor in the Pitti palace, Florence. He also co-operated in or finished several other works by Pietro, both in Florence and in Rome. Of his own independent productions, the chief is an extensive series of scriptural frescoes in the church of S. Maria Maggiore in Bergamo; also a painting (rated as Ferri's best work) of St. Ambrose healing a sick person, the principal altarpiece in the church of S. Ambrogio in Rome. He executed also a large amount of miscellaneous designs, such as etchings and frontispieces for books; and he was an architect besides. Ferri was appointed to direct the Florentine students in Rome, and Gabbiani was one of his leading pupils. He died in Rome on Sept. 13, 1689.

FERRI, LUIGI (1826–1895), Italian philosopher, was born at Bologna on June 15, 1826. Educated at the Ecole Normale in Paris, he lectured in the colleges of Evreux, Dieppe, Blois, Toulouse, Annecy and Casal-Montferrat, and became head of the education department under Mamiani in 1860. In 1863 he became professor of philosophy at the Istituto di Perfezionamento at Florence, and, in 1871, in the University of Rome. He is known especially as an historian of philosophy. His original work is eclectic, combining the psychology of his teachers, Jules Simon, Saisset and Mamiani, with the idealism of Rosmini and Gioberti. His chief works are *Studi sulla coscienza*; *Il Fenomeno nelle sue relazioni con la sensazione*; *Della idea del vero*; *Della filosofia del diritto presso Aristotile* (1855); *Il Genio di Aristotile* (1866); *La Psicologia di Pomponazzi* (1877); *Essai sur l'histoire de la philosophie en Italie au XIX^e siècle* (1869), and *La Psychologie de l'association depuis Hobbes* (1883).

FERRIER, SIR DAVID (1843–1928), British neurologist, was born on Jan. 13, 1843, at Aberdeen. He was educated at his native town, at Heidelberg, where he turned from the study of philosophy to that of medicine, and at Edinburgh where he took his M.B. in 1868. Ferrier was successively lecturer on physiology at the Middlesex hospital, London (1870–72), professor of forensic medicine at King's college (1872–89), professor of neuropathology (1889–1928), physician to King's College hospital and physician to the National hospital for the paralysed and epileptic, in Queen square. He was knighted in 1911.

While practising his profession, Ferrier devoted himself to the research on the physiology of the brain, especially on the localization of cerebral functions and the removal of tumours. His early epoch-making papers on this subject, which appeared from 1873–76, and his important work, entitled *Functions of the Brain* (1876, 2nd ed. 1886), at once secured for him the attention of the scientific world. By persistent experiments, Ferrier raised the vague speculations concerning cerebral functions into the definite modern science of neurology. He died in London on March 19, 1928.

His *Croonian Lectures on Cerebral Localization* appeared in 1890

and his *Regional Diagnosis of Cerebral Disease* in 1910.

FERRIER, JAMES FREDERICK (1808–1864), Scottish metaphysician, was born in Edinburgh on June 16, 1808. He studied at Edinburgh and Oxford, and subsequently at Heidelberg. In 1842 he was appointed professor of civil history at Edinburgh and in 1845 professor of moral philosophy and political economy at St. Andrews, where he remained till his death on June 11, 1864.

His first contribution to metaphysics was a series of articles in *Blackwood's Magazine* (1838–39), entitled *An Introduction to the Philosophy of Consciousness*. Among Ferrier's succeeding articles the chief were *The Crisis of Modern Speculation* (1841), *Berkeley and Idealism* (1842), and an important examination of Hamilton's edition of Reid (1847), which contains a vigorous attack on the philosophy of common sense.

Ferrier's mature *Institutes of Metaphysics* (1854) attempts to employ the method of Spinoza, strict demonstration. All the errors of natural thinking or phenomenalism, which philosophy must correct, fall under one or other of three topics:—Knowing and the Known, Ignorance, and Being. The problems of knowing and the known are treated in the "Epistemology or Theory of Knowing." Along with whatever any intelligence knows it must, as the ground or condition of its knowledge, have some cognizance of itself. Object+subject, thing+me, is the only possible knowable; hence the only independent universe which any mind can think of is the universe in synthesis with some *other* mind or *ego*.

The leading contradiction which is corrected in the "Agnology or Theory of Ignorance," the section which Ferrier regarded as most original, is that there can be an ignorance of that of which there can be no knowledge. Ignorance is a defect which can only concern that which is knowable *i.e.* some-object-plus-some-subject.

The "Ontology or Theory of Being," the final division, contains a discussion of the origin of knowledge, in which Ferrier traces all perplexities and errors to the assumption of the absolute existence of matter. He concludes that the only true real and independent existences are minds-together-with-that-which-they-apprehend, and that the one strictly necessary absolute existence is a supreme, infinite and everlasting mind in synthesis with all things.

A complete edition of Ferrier's philosophical writings including the noticeable *Lectures on Greek Philosophy*, was published in 1875. See also E. S. Haldane, *J. F. Ferrier* (Edinburgh, 1899).

FERRIER, PAUL (1843–1920), French dramatist, was born at Montpellier on March 29, 1843, and he died at Nouan-le-Fuzelier on Sept. 11, 1920. One of Ferrier's greatest triumphs was the production with Fabrice Carré of *Joséphine vendue par ses sœurs* (1886), an *opéra bouffe* with music by Victor Roger. His opera libretti include *La Marocaine* (1879), music of J. Offenbach; *Le Chevalier d'Harmental* (1896) after the play of Dumas père, for the music of A. Messager; *La Fille de Tabarin* (1901), with Victorien Sardou, music of Gabriel Pierné.

FERRIER, SUSAN EDMONSTONE (1782–1854), Scottish novelist, born in Edinburgh on Sept. 7, 1782, was the daughter of James Ferrier, at one time one of the clerks of the court of session with Sir Walter Scott.

Susan Ferrier's first novel, *Marriage* (1818), was begun in concert with a friend, Miss Clavering, but this lady wrote only a few pages. It was followed in 1824 by *The Inheritance*, a better constructed and more mature work; and the last and perhaps best of her novels, *Destiny*, appeared in 1831. All these novels were published anonymously. With their clever portraiture of contemporary Scottish life and manners, and even recognizable caricatures of some social celebrities of the day, they could not fail to become popular north of the Tweed. Many were the conjectures as to the authorship of the novels. In the *Noctes Ambrosianae* (Nov. 1826) James Hogg is made to mention *The Inheritance*, and adds, "which I aye thought was written by Sir Walter, as weel's *Marriage*, till it spunked out that it was written by a leddy." Scott himself gave Susan Ferrier a very high place indeed among the novelists of the day. In his *Tales of My Landlord* he calls her his "sister shadow," the still anonymous author of "the very lively work entitled *Marriage*." Lively, indeed, all her works are, written in clear, brisk English, and with an inex-

haustible fund of humour. Her books portray the society in which she lived, caricaturing with terrible exactness its hypocrisy, boastfulness, greed, affection and undue subservience to public opinion. Yet she wrote less to reform than to amuse. In this she is less like Maria Edgeworth than Jane Austen. Maria Edgeworth was more of a moralist; her wit is not so involuntary, her caricatures not always so good-natured. But Jane Austen and Susan Ferrier were genuine humorists, and with the latter especially a keen sense of the ludicrous was always dominant. Her humorous characters are always her best. But if she was not a moralist, neither was she a cynic; and her wit, even where it is most caustic, is never uncharitable.

Susan Ferrier lived at Morningside House and in Edinburgh for more than twenty years after the publication of her last work. Lockhart describes her visit to Scott in May 1831. She died on Nov. 5, 1854, in Edinburgh. She left among her papers a short unpublished article, entitled "Recollections of Visits to Ashestiel and Abbotsford." This is her own very interesting account of her long friendship with Sir Walter Scott. It contains some impromptu verses written by Scott in her album at Ashestiel.

See Sir G. B. S. Douglas, *The Blackwood Group* (Famous Scots Series, 1897); *Memoir and Correspondence of Susan Ferrier*, collected by John Ferrier, ed. J. A. Doyle (1898).

FERRO-CONCRETE. Ferro-concrete or reinforced concrete is a combination of fine concrete with embedded steel bars adapted to structural purposes. The concrete element is an artificial stone-like material of excellent durability which offers great resistance to crushing or compressive stress, but has relatively small tensile strength. Mild steel bars, on the other hand, have great tensile strength and when provided in suitable quantity and correct location can be utilized to make good the deficiency of the concrete in that respect. Construction in ferro-concrete is therefore based on the combination of the two materials according to scientific principles whereby they co-operate in sustaining safely the loads and stresses to which the structure is exposed.

The first operation in the execution of a ferro-concrete structure consists in the forming and supporting in correct position of a set of external moulds of timber or sheet metal which reproduce the form of the members or parts to be constructed. The next step is the placing and fixing of the system of steel reinforcing bars within or on the moulds, which are then filled with soft concrete newly mixed. The steel reinforcement thus becomes embedded in the concrete which gradually hardens and forms the general binding material of the system. After the lapse of a setting period of a few days or weeks the moulds are removed and the finished concrete is exposed. Such construction is adapted to an infinite variety of purposes in engineering and building construction and is now preferred for many purposes for which wood and steel were formerly considered appropriate. It has great advantages over wood in respect of strength and durability and is much superior in fire-resisting qualities to both wood and bare steelwork. In most circumstances, too, the steel bars in ferro-concrete are efficiently protected by the cement against corrosion.

See CONCRETE.

(J. WL.)

FERROL, a city of north-west Spain, province of Corunna; 41 m. by rail N.E. of the city of Corunna; on the Bay of Ferrol, an inlet of the Atlantic ocean. Pop. (1920) 30,350. Ferrol ranks with Cartagena and San Fernando, near Cadiz, as one of the principal naval stations of Spain. The town, beautifully situated on a headland on the north shore of the bay, is concealed by rocky hills from view from the sea. Its fine, natural harbour, one of the best in Europe, and the largest in Spain, except those of Vigo and Cartagena, is deep and safe; but the entrance is a narrow strait about 2 m. long, which admits only one vessel at a time, and is commanded by powerful modern batteries and forts on either side of the bay. Ferrol has extensive shipbuilding yards and a large arsenal basin, with workshops and foundries, and two dry docks. Across a broad inlet west of the headland lies the submarine base of La Graña. Since the 1908 decree for bringing the Spanish navy up to date, considerable constructional work has gone on in the dockyards. Local industries are mainly connected with the building or refitting of naval vessels. Owing to the competition of

Corunna, at so short a distance, and in the past to the lack of railway communication, Ferrol is not a first class commercial port. It is now connected by rail with Betanzos, and in 1928 a line was under construction from Gijón; but the exports are insignificant, consisting mainly of pit-props, and the chief imports are coal, cement, timber, iron and machinery, for use in the shipping industries.

Ferrol was a mere fishing village until, in 1726, Charles IV. chose it as the site for a naval arsenal, and Ferdinand VI. (1746-1759) later set up shipbuilding yards here. In 1799 the British made a fruitless attempt to capture it, but on Nov. 4, 1805, they defeated the French fleet in front of the town, which they compelled to surrender. Delivered by treachery to the French on Jan. 27, 1809, it was vacated by them on July 22. After a month's blockade Ferrol surrendered to the French on Aug. 27, 1823.

FERROMAGNETISM, the kind of magnetism associated with iron, nickel, cobalt, alloys of these metals, some compounds of iron, and some compounds and alloys of manganese. These substances are the *ferromagnetic* substances and exhibit marked magnetic properties; e.g., they are easily magnetized; they acquire a high value of magnetization in extremely small magnetic fields. (See **MAGNETISM**: *Ferromagnetism*.)

FERRUCCIO or **FERRUCCI**, **FRANCESCO** (1489-1530), Florentine captain. He served in the *Bande Nere* in various parts of Italy, earning a reputation as a daring fighter and somewhat of a swashbuckler. When Pope Clement VII. and the emperor Charles V. decided to reinstate the Medici in Florence, they made war on the Florentine republic, and Ferruccio was appointed Florentine military commissioner at Empoli, where he showed great daring and resource by his rapid marches and sudden attacks on the Imperialists. Early in 1530 Volterra had thrown off Florentine allegiance and had been occupied by an Imperialist garrison, but Ferruccio surprised and recaptured the city. During his absence, however, the Imperialists captured Empoli by treachery, thus cutting off one of the chief avenues of approach to Florence. Ferruccio then attempted a diversion by attacking the Imperialists in the rear and started from Volterra for the Apennines. But at Pisa he was laid up for a month with a fever—a misfortune which enabled the enemy to get wind of his plan and to prepare for his attack. At the end of July Ferruccio left Pisa at the head of about 4,000 men, and although the besieged in Florence, knowing that a large part of the Imperialists under the prince of Orange had gone to meet Ferruccio, wished to co-operate with the latter by means of a sortie, they were prevented from doing so by their own traitorous commander-in-chief, Malatesta Baglioni. Ferruccio was defeated on Aug. 3 at Gavinana; he himself was wounded and captured. Maramaldo out of personal spite despatched the wounded man with his own hand. Nine days later Florence surrendered. Ferruccio was one of the great soldiers of the age, and his enterprise is the finest episode of the last days of the Florentine republic. (See also under **FLORENCE** and **MEDICI**.)

BIBLIOGRAPHY.—F. Sasseti, *Vita di Francesco Ferrucci*, written in the 16th century and published in the *Archivio storico*, vol. iv. pt. ii. (Florence, 1853), with an introduction by C. Monzani; E. Aloisi, *La Battaglia di Gavinana* (Bologna, 1881); cf. P. Villari's criticism of the latter work, "Ferruccio e Maramaldo," in his *Arte, storia, e filosofia* (Florence, 1884); Gino Capponi, *Storia della repubblica di Firenze*, vol. ii. (Florence, 1875).

FERRULE, a small metal cap or ring holding parts of a rod, etc., together, or giving strength to weakened materials, or especially, when attached to the end of a stick or umbrella, for preventing wearing or splitting (Fr. *virole* from Lat. diminutive *viriae*, bracelets, cf. also Lat. *ferrum*, iron). "Ferrule" must be distinguished from "ferule" or "ferula," properly the Latin name of the "giant fennel." From the use of the stalk of this plant as a cane or rod for punishment comes the application of the word to many instruments used in chastisements, particularly a short flat piece of wood or leather, shaped somewhat like the sole of a boot, and applied to the palm of the hand; the pain inflicted is exceedingly sharp and immediate, but the effects are momentary. The word is sometimes applied to the ordinary cane as used by schoolmasters.

FERRY, JULES FRANÇOIS CAMILLE (1832-1893), French statesman, was born at Saint Dié (Vosges) on April 5, 1832. He studied law, was called to the bar at Paris, and contributed to the *Temps*. He attacked the empire with great violence, directing his opposition especially against Baron Haussmann, prefect of the Seine. Elected republican deputy for Paris in 1869, he protested against the declaration of war with Germany, and on Sept. 6, 1870 was appointed prefect of the Seine by the government of national defence. He administered Paris during the siege, and after the Commune was obliged to resign (June 5, 1871). From 1872-1873 he was minister in Athens, but returned to the chamber as deputy for the Vosges, and became one of the leaders of the republican party. He was a member of the first republican ministry formed under W. H. Waddington on Feb. 4, 1879, and continued in the ministry until March 30, 1885, except for two short interruptions, first as minister of education and then as minister of foreign affairs. He was twice premier (1880-81 and 1883-1885). Two important works are associated with his administration, the non-clerical organization of public education, and the beginning of the colonial expansion of France. He reorganized the committee of public education (law of Feb. 27, 1880), and proposed a regulation for the conferring of university degrees, which, though rejected, aroused violent polemics because the 7th article took away from the unauthorized religious orders the right to teach. He finally succeeded in passing the great law of March 28, 1882, which made primary education in France free, non-clerical and obligatory. In higher education the number of teachers doubled under his ministry. After the military defeat of France by Germany in 1870, he formed the idea of acquiring a great colonial empire, not to colonize it, but for the sake of economic exploitation. He directed the negotiations which led to the establishment of a French protectorate in Tunis (1881), prepared the treaty of Dec. 17, 1885 for the occupation of Madagascar; directed the exploration of the Congo and of the Niger region; and above all he organized the conquest of Indo-China. The excitement caused at Paris by an unimportant reverse of the French troops at Lang-sou caused his downfall (March 30, 1885), but the treaty of peace with China (June 9, 1885) was his work. After the resignation of President Grévy (Dec. 2, 1887), he was a candidate for the presidency of the republic, but the radicals refused to support him, and he withdrew in favour of Sadi Carnot. The violent polemics directed against him caused a madman to attack him with a revolver, and he died from the wound on March 17, 1893. The chamber of deputies voted him a state funeral. See Edg. Zevort, *Histoire de la troisième République*; A. Rambaud, *Jules Ferry* (Paris, 1903).

FERRY, a place where boats ply regularly across a river or arm of the sea for the conveyance of goods and persons. In law the right of ferrying persons or goods across a particular river or strait, and of exacting a reasonable toll for the service, belongs, like the right of fair and market, to the class of rights known as franchises (see **FRANCHISE**). Its origin must be by statute, royal grant or prescription. It is wholly unconnected with the ownership or occupation of land, so that the owner of a ferry need not be proprietor of the soil on either side of the water over which the right is exercised. He is bound to maintain safe and suitable boats ready for the use of the public, and to employ fit persons as ferrymen. As a correlative of this duty he has a right of action, not only against those who evade or refuse payment of toll when it is due, but also against those who disturb his franchise by setting up a new ferry, so as to diminish his custom, unless a change of circumstances, such as an increase of population near the ferry, justify other means of passage, whether of the same kind or not. (See also **WATER RIGHTS**; **SHIP**: *Ferry Steamers, Train Ferries*.)

FERRY-BOAT, a boat used for ferrying passengers and vehicles (see **FERRY**). The floor plan of the large, modern ferry-boat is roughly divided into five parts. The inner section is devoted to power; two surrounding passages running the length of the boat hold one or two lines of vehicles; while the two outer sections are arranged as cabins for passengers, one serving as a smoking room, and one as a ladies' cabin. Many have two decks, with a closed cabin and a promenade on the upper.

FERSEN, FREDRIK AXEL, COUNT VON (1719-1794), Swedish politician, entered the Swedish Life Guards in 1740, and from 1743 to 1748 was in the French service (*Royal-Suédöis*), where he rose to the rank of brigadier. At the diet of 1755-56 he was elected *landtmarskalk*, or marshal of the diet, and from henceforth, till the revolution of 1772, led the Hat party (see SWEDEN: *History*). In 1756 he defeated the projects of the court for increasing the royal power; but, after the disasters of the Seven Years' War, gravitated towards the court again and contributed, by his energy and eloquence, to uphold the tottering Hats for several years. On the accession of the Caps to power in 1766, Fersen assisted the court in its struggle with them by refusing to employ the Guards to keep order in the capital when King Adolphus Frederick, driven to desperation by the demands of the Caps, publicly abdicated, and a seven days' interregnum ensued. At the ensuing diet of 1769, when the Hats returned to power, Fersen was again elected marshal of the diet; but he made no attempt to redeem his pledges to the crown prince Gustavus, as to a very necessary reform of the constitution, which he had made before the elections, and thus involuntarily contributed to the subsequent establishment of absolutism.

When Gustavus III. ascended the throne in 1772, and attempted to reconcile the two factions by a composition which aimed at dividing all political power between them, Fersen consented to open negotiations with the Caps, and was the principal Hat representative on the abortive composition committee. During the revolution of Aug. 1772, Fersen remained a passive spectator of the overthrow of the constitution, and was one of the first whom Gustavus summoned to his side after his triumph. Yet his relations with the king were never cordial. There was a slight collision between them as early as the diet of 1778; but at the diet of 1786 Fersen boldly led the opposition against the king's financial measures (see GUSTAVUS III.) which were consequently rejected. At the diet of 1789 Fersen marshalled the nobility around him for a combat à outrance against the throne and that, too, at a time when Sweden was involved in two dangerous foreign wars, and national unity was absolutely indispensable. This tactical blunder materially assisted the secret operations of the king. He and 20 of his friends of the nobility were arrested (Feb. 17, 1789) and the opposition collapsed. Fersen was speedily released, but henceforth kept aloof from politics, surviving the king two years. His *Historiska Skrifter*, a record of Swedish history, mainly autobiographical, during the greater part of the 18th century, is excellent as literature, but somewhat unreliable as an historical document.

See C. G. Malmström, *Sveriges politiska Historia* (Stockholm, 1855-65); R. N. Bain, *Gustavus III.* (1895); C. T. Odhner, *Sveriges politiska Historia under Gustaf III.'s Regering* (Stockholm, 1885, etc.); F. A. Fersen, *Historiska Skrifter* (Stockholm, 1867-72).

FERSEN, HANS AXEL, COUNT VON (1755-1810), Swedish statesman, was educated at home, and at the military schools of Brunswick, Turin and Strasbourg. In 1779 he entered the French military service (*Royal-Bavière*), accompanied General Rochambeau to America as his adjutant, distinguished himself during the war with England, notably at the siege of Yorktown, 1781, and in 1785 was promoted to be *colonel propriétaire* of the regiment *Royal-Suédöis*. The queen, Marie Antoinette, was especially attracted by his grace and wit and it is possible that he would have passed his life at Versailles, but for a hint from his own sovereign, then at Pisa, that he desired him to join his suite. He accompanied Gustavus III. in his Italian tour and returned home with him in 1784. Fersen went with his regiment to Finland in 1788, but in the autumn of the same year returned to France, where Gustavus required an agent thoroughly in the confidence of the French royal family, and sufficiently able and audacious to help them in their desperate straits. Before the end of 1790 Fersen had to admit that the cause of the French monarchy was hopeless so long as the king and queen of France were captives in their own capital. Finding the requisite funds he made the arrangements for their flight to Varennes, and was the coachman of the *fiacre* which drove the royal family from the Carrousel to the Porte Saint-Martin.

In 1791, Fersen was sent to Vienna to induce the emperor Leopold to accede to a new coalition against revolutionary France, but he soon realized that the Austrian court meant to do nothing, and was transferred to Brussels, where he could be of more service. In Feb. 1792, he reached Paris with counterfeit credentials as minister plenipotentiary to Portugal. On Feb. 13, he had three interviews with the royal family, but returned to Brussels on the 27th, having accomplished nothing. In 1797 Fersen was sent to the congress of Rastatt as the Swedish delegate, but in consequence of a protest from the French government, was not permitted to take part in it.

During the regency of the duke of Sudermania (1792-96) Fersen, like all the other Gustavians, was in disgrace; but, on Gustavus IV. attaining his majority in 1796, he was reinstated in all his offices and dignities. In 1801 he was appointed *Riksmarskalk* (=earl-marshal). On the outbreak of the war with Napoleon, Fersen accompanied Gustavus IV. to Germany to assist him in gaining fresh allies. He prevented Gustavus from invading Prussia in revenge for the refusal of the king of Prussia to declare war against France, and during the rest of the reign was in semi-disgrace, though generally a member of the government when the king was abroad.

Fersen stood aloof from the revolution of 1809. (See SWEDEN: *History*.) His sympathies were entirely with Prince Gustavus, son of the unfortunate Gustavus IV., and when the newly elected successor to the throne, prince Christian Augustus of Augustenburg, died suddenly in Skåne in May 1810, the report spread that he had been poisoned, and that Fersen and his sister, the countess Piper, were accessories. When the prince's body was conveyed to Stockholm on June 20, 1810, and Fersen, in his official capacity as *Riksmarskalk*, received it at the barrier and led the funeral cortège into the city, he was attacked by the mob. In order to save him, two officers volunteered to conduct him to the senate house and there place him in arrest. But when he appeared on the steps, the crowd rushed on him and kicked and trampled him to death, while the troops, drawn up in the Riddarhus Square, made no effort to rescue the *Riksmarskalk*.

Gault, *Un Ami de la reine* (1892); F. F. Flach, *Grefve Hans Axel von Fersen* (Stockholm, 1896); E. Tegner, *Gustaf Mauritz Armfjelt*, vol. iii. (Stockholm, 1883-87); O. G. de Heidenstam, *Marie-Antoinette, Fersen and Barnave; leur Correspondance* (1913, Eng. trs., 1926).

FERTILIZATION. Before the eggs of most animals and plants can begin their development it is necessary that they should unite with specialized cells derived from the body of a male organism. This union is the essential characteristic of fertilization. In all higher animals and in all flowering plants the union of the gametes occurs within the body of the mother organism, but in many other instances, e.g., most fishes, ferns, the eggs and spermatozoa, or the latter alone, are shed into water and fertilization occurs in this medium.

In animals, the male cell or spermatozoon is typically small in size and consists of three main parts: (i.) the head, composed almost exclusively of the nucleus, (ii.) the middle piece, (iii.) the tail, which being vibratile, provides the means whereby the cell propels itself rapidly through the medium in which fertilization occurs. All these three parts play an essential rôle in fertilization. As a rule spermatozoa do not move as long as they lie within the organs of the male's body; they only begin to swim with intense activity when shed into the medium containing the eggs, and even then their active life is limited to a very short period of time, varying from a few minutes in the case of a fish to two days in that of mammals.

The ripe unfertilized egg, on the other hand, is a peculiarly inert cell until after a spermatozoon has rendered it fertile. As it leaves the ovary of oviparous animals, the egg contains all the raw materials and most of the mechanism requisite for the formation of a complete embryo, and the accumulated yolk from which this embryo is formed often renders the egg a large and conspicuous object.

The process by which a spermatozoon is incorporated into the

substance of an egg is most conveniently studied in animals in which fertilization takes place outside the body of the female parent. The simplest and perhaps the best examples are provided by many species of sea-urchins (Echinoidea) which shed their gametes, in large numbers, into the surrounding sea water. If ripe eggs and spermatozoa are mixed together in a drop of sea water it can be seen (under the low powers of the microscope) that the presence of the eggs exerts a powerful stimulus on the male cells, causing them to swim with greatly increased vigour and rapidity. This effect is due to an exudation from the eggs (fertilin) which ceases to be produced as soon as the eggs have actually united with spermatozoa. Contact between egg and spermatozoon is, in animals, not due to mutual attraction but is the result of chance collisions between the stationary egg and the motile male cells. In some plants, *e.g.*, ferns, the female system appears to secrete malic, tartaric, or other acid which attracts the spermatozoa towards the eggs.

As soon as a spermatozoon strikes the surface of the egg it begins to burrow rapidly through the gelatinous coat by which the female gamete is surrounded. In this way many spermatozoa may reach the cortex of a single egg, but only one takes part in the essential act of fertilization. In some cases the unfertilized egg is surrounded by a tough membranous capsule (as in the salmon) so that the spermatozoa can only reach the egg through a special aperture in the capsule known as the micropyle. In such forms fertilization must occur at the base of the micropyle, whereas in other types it may usually occur at any point on the egg's surface.

The initial phase of fertilization occurs when the head of the effective spermatozoon becomes attached to the surface of the egg. From this moment onwards the inertia of the egg is lost; it begins to respire actively and the whole cycle of growth and development starts. In many cases a visible change occurs at the egg surface whereby a fertilization membrane is formed, thus enclosing the egg within a spherical container considerably larger than the egg. The actual incorporation of the spermatozoon into the egg is due to the activity of the latter rather than to that of the spermatozoon. At the point of contact between the cells a small cone-like protrusion forms on the egg surface, and in this fertilization-cone the male cell gradually becomes embedded. The cone then subsides and the spermatozoon is thereby drawn into the egg. The vibratile tail of the sperm, so essential for effecting contact with the egg loses its power of movement as soon as the head is attached to the female cell; subsequent to this it often degenerates or is lost: both sperm head and middle piece enter the substance of the egg.

Shortly after the subsidence of the fertilization cone, the male elements (middle piece and nucleus) rotate about their own axis so that the middle piece instead of being directed towards the periphery of the egg is now nearer to the centre than is the male nucleus. Both structures move towards the egg nucleus which in turn moves up to meet them. During this movement significant changes occur in both nucleus and middle piece of the spermatozoon. The former considerably enlarges in size and eventually becomes almost identical in appearance with the egg nucleus. The middle piece of the spermatozoon which is at first a more or less compact structure soon becomes the centre of a series of rays, which are known as the male aster. Some authorities believe that the normal cleavage of an egg cell is made possible by the in-

FROM WILSON, "THE CELL IN DEVELOPMENT AND HEREDITY" (MACMILLAN)

FIG. 1.—ENTRANCE AND ROTATION OF THE SPERM-HEAD AND FORMATION OF THE SPERM-ASTER IN THE SEA URCHIN (TOXOPNEUSTES)

corporation into the cell of this male aster. Another aster is believed to be associated with the female nucleus, so that in a fertilized egg the two astral bodies necessary for normal cleavage are both present. By the time the female and male nuclei have come into contact the radiations of the male aster extend throughout the whole egg. The nuclei now fuse together to form a zygote nucleus, the radiations from the aster fade away and the process of fertilization is complete. From this point onward the zygote nucleus proceeds to undergo mitotic division and the phenomena of segmentation and development follow in their normal sequence. (See CYTOLOGY AND EMBRYOLOGY.) The nucleus of the spermatozoon does not appear to be necessary for the initiation of development, but on the other hand it introduces into all the cells of the developing embryo one complete set of the hereditary factors transmitted by the male parent in its chromosomes.

In the majority of cases an egg can only be fertilized by a spermatozoon if both cells are derived from organisms belonging to the same species. Cases of hybridization are, however, not uncommon, but in almost every case the offspring of such matings are themselves sterile, *e.g.*, mules, certain hybrid moths, pheasants. In some cases the failure to obtain hybrid forms is due to an inability of the egg and spermatozoon to unite, whilst in others the foreign spermatozoa having fertilized the eggs give rise to embryos which die at an early stage of development (many bony fishes). An interesting case of natural sterility is provided by some species of hermaphrodite animals (Ascidians). These animals produce both eggs and spermatozoa which, although they mature at the same time, will not unite unless the eggs are derived from one individual and the spermatozoa from another. Similar cases of self-sterility are known among plants.

The reproductive power of an animal depends on three important factors: (1) The number of eggs and spermatozoa which the parents produce, (2) the chances which are provided for an active

FROM WILSON, "THE CELL IN DEVELOPMENT AND HEREDITY" (MACMILLAN)

FIG. 2.—FERTILIZATION (SEA URCHIN TYPE) AND BEGINNING OF FIRST CLEAVAGE (DIAGRAMMATIC)

spermatozoon to reach a fertilizable egg, (3) the chances of a newly fertilized egg completing its development into an adult organism. In many of the lower animals and plants there is no close proximity between the sexes at the moment of liberation of the gametes. Very large numbers of eggs and spermatozoa are shed into the surrounding medium, and fertilization depends solely on chance collisions, although there is often a tendency for a large number of both sexes to shed their gametes at the same moment or in response to a certain set of external conditions, *e.g.*, a particular phase of the tide, or of the moon. A somewhat

later phase in the evolution of the fertilization mechanism is reached by those animals, *e.g.*, many fish, in which the male and female individuals come into very close proximity before shedding their generative cells. Thus a male salmon sheds its spermatozoa over eggs which have just been deposited in a depression made by the female fish on the gravelly river bed. Even under these conditions, many eggs escape fertilization and better results are obtained by removing ripe fish from the water and "stripping" them of their gametes; these are then mixed together, and the whole mass submerged in water. In all cases of oviparous animals considerable wastage occurs unless the chances of fertilization are high and unless the developing eggs are protected from external accident and predatory organism. This wastage is largely avoided when fertilization is effected within the body of the female parent, and in such cases the causes of infertility are not easy to analyse. In mammals the most likely causes of infertility appear to be (i.) inability of the spermatozoa to move with sufficient activity, (ii.) mechanical obstructions which prevent the passage of the sperm into the Fallopian tubes where fertilization occurs, (iii.) absence of fertilizable eggs in the female tract at a time when motile spermatozoa are present, (iv.) inability of the fertilized egg to pass into the uterus and there attach itself normally.

Artificial Parthenogenesis.—In some animals notably sea-urchins, the eggs may be readily induced to develop without fusion with a male gamete. If such eggs are exposed to solution of certain chemical substances (chloroform, saponin, butyric acid) in sea water, the egg surfaces undergo precisely the same visible changes as occur immediately after contact with a spermatozoon. In order that the eggs, so activated, should develop into larvae it is necessary, as a rule, to expose them subsequently to sea water containing an abnormally high concentration of salts or other osmotically active substances. After this, the eggs develop normally when replaced in pure sea water. It seems probable that the treatment with concentrated sea water induces in the egg the formation of an aster, comparable to that which develops from the middle piece of the spermatozoon.

The only vertebrate egg which has yet been induced to develop parthenogenetically is that of the frog. In this case development is initiated by puncturing the surface of the egg with a very fine needle, and no further treatment is required. It is claimed that an aster develops near the puncture. (*See PARTHENOGENESIS.*)

Fertilization in Plants.—In plants the essential union of male and female nuclei is fundamentally the same as in animals. In terrestrial types the male gametes are not capable of autonomous movement but form part of the pollen grains, which are carried to the female system of the flower by wind or other external agency. Communication between the male generative cell and the female egg is effected by means of the pollen tube which grows from the pollen grain and penetrates into the embryo-sac in which the egg cell is situated. (*See ANGIOSPERMS; FERTILIZATION.*) (J. GR.)

FERTILITY AND FECUNDITY. Fertility is the power to beget living offspring; fecundity that of the individual to produce functional gametes (marrying cells, sex-cells, in the higher animals' ova and sperms). The reproductive rate of a mating or of a generation is determined both by the fecundity of the individuals composing it and by the fertility of their matings.

Fecundity is affected by factors which determine or influence:

(1) *The number of gametes available at the time of fertilization.* In certain forms the female is monotocous (producing one young at a birth), only one ovum being extruded from the ovary and becoming available for fertilization at each period of "heat." In others she is polytocous, several or many extruded ova being available for synchronous fertilization by the abundant sperm. In both forms the ripening of the ova and the number extruded are conditioned by environmental factors. As a general rule, the average number of offspring in a litter in any species of mammals is inversely proportional to the average size of the animals of that species. In ungulates, twins are exceptional. The sow, however, is remarkable in having very large litters. In small mammals and rodents large litters are the rule, but the bats are exceptional,

only one young ordinarily being produced at a time, doubtless to avoid extra weight when flying. Broadly speaking those species in which the gestation period exceeds six months produce but one young at a time and the number of teats is an approximate indication of the average size of the litter. In a general way, fecundity is in direct relation to the chances of death; those species which have many enemies produce many eggs but there are numerous exceptions to this rule. The initial fecundity gradually waxes to a climax and thereafter gradually wanes. In polytocous animals the first litter as a rule is relatively smaller as are those which are born towards the end of the reproductive life of the individual. In the fowl the greatest fecundity is exhibited during the first year and diminishes rapidly and progressively thereafter. It is probable that artificial selection is the cause of this antedating of the peak of fecundity in the fowl. Increased nourishment is followed by an increase in the number of ova shed in the polytocous forms, *e.g.*, the effects of "flushing" (special feeding) in sheep. Insufficient food and especially a deficiency of the accessory food substances, vitamins B and E (*see VITAMIN*) lead to an imperfect production or to the non-production of gametes by both male and female. The number of sperms is an important factor in efficient fertilization, for a certain concentration is required in the rabbit. Ordinarily, spermatozoa are present in amply sufficient numbers in the male ejaculate. Hammond (1925) found that in the case of the male rabbit repeated intercourse was followed by no reduction in fertility, though the periods between copulations became increased. Lloyd Jones and Hays (1918), however, found that excessive intercourse led to a reduction both in pregnancies and in litter size.

(2) *The frequency of ovulation.* There are monoestrous forms in which the female has but a single oestrous cycle within one sexual season, and polyoestrous in which she has two or more. Since fertilization can only occur during the oestrous cycle the reproductive rate is limited by the frequency of these cycles. In most wild mammals the male experiences a sexual season as well as the female and generative activity is entirely restricted to such times. In man and most domesticated animals, however, the male is capable of sexual intercourse at all seasons, though an increased sexual activity may be evidenced at certain times of the year. Since in the human female there is no restricted sexual season fertilization can occur at all times throughout the year. Long continued lactation would seem commonly to exert an inhibitory influence on the oestrous cycle. In the pig, early weaning leads to a more frequent recurrence of oestrous cycles and an increased number of litters.

(3) *The length of life of the individual and the length of its reproductive phase.* Longevity is an hereditary character. Fecundity is exhibited during the period of life between puberty and senescence. The total number of opportunities for fertilization is influenced by hereditary and environmental factors which affect the time of attainment of puberty, the time of the onset of the climacteric, and the length of life. The protection and sanitation of domestication and civilization can prolong life and delay the decline of reproductive vigour.

(4) *The functional ability of the gametes.* The gametes of the mule and of other interspecific hybrids are in the great majority of cases inherently imperfect and incapable of fusing in proper fertilization. Commonly the sterility in these cases is due to irregularities in the mechanism of division of the germ-cells and in some to the fact that the chromosome number and form of the two parental forms are widely different (*see CYTOLOGY*). Poisons, toxins and X-rays can render the gametes imperfect. The intra-abdominal undescended testis (*e.g.*, in so-called "rigs" in horses) cannot proceed to the elaboration of functional sperm for this cannot occur at a temperature as high as that within the body. Certain wild animals when removed from their natural habitat and kept in captivity become partially or completely sterile even though kept in a healthy condition and in their native countries. For reasons as yet unknown the generative system fails to discharge its functions: there is either an absence of sexual desire or an inability to elaborate functional gametes. Some normal stimulus to sexual activity, possibly a psychological one,

is lacking.

Fertility.—The union of the gametes and the proper development of the resulting individual is embarrassed or prevented by factors which affect:

(1) *The act of sexual congress, e.g., homosexuality, intersexuality and other structural, physiological and psychological anomalies.*

(2) *The actual union of the gametes after efficient congress.* For reasons as yet unknown, certain individuals are infertile *inter se* but when mated with other individuals beget offspring. In human societies a differential fertility-rate distinguishes the social grades. The average size of the family among the relatively socially unsuccessful is on the whole greater than that of the successful. Much of this difference is due to differences in the exercise of control, abstinence, and the use of contraceptives. It has not yet been demonstrated that any of it is due to a differential fecundity distinguishing the social grades.

(3) *The ante-natal nurture of the offspring.* Hereditary and environmental factors can bring about the death of the embryo and foetus *in utero*. In polytocous forms the number of fertilized ova is frequently in excess of the nutrition available for them with the result that atrophy and absorption of the surplus embryos and foetuses occur. In other cases the death of the offspring is due to the action of hereditary lethal factors (*see HEREDITY*). An instance of such lethal factors is that which eliminates the homozygous yellow mouse. The mating yellow \times yellow invariably yields yellows and greys in the ratio 2:1. Such yellows are constitutionally heterozygous: the homozygous yellow dies *in utero* as the result of the action of the hereditary factor for yellow present in duplicate. Haemophilic (bleeder) female children are comparatively rare: it is thought that the homozygous haemophilic usually dies early in pregnancy; only the female can carry the factor for this sex-linked character in duplicate (*see HEREDITY*). An examination of the sex-ratio among new-born children, still-births and abortions, reveals the fact that during intra-uterine life and parturition more males than females succumb. The male is constitutionally less able to withstand unfavourable conditions.

(4) *The post-natal viability of the individual.* The same hereditary and environmental factors as those which operate ante-natally are responsible for the fact that more males than females succumb during the ante-pubertal period. During the age group 10–15 years more females than males die, a reflection of the dangers that beset the onset of puberty in the female. (*See REPRODUCTION*.)

FERTILIZERS. The words fertilizer and manure denote any substance that increases the productiveness of the soil, but in scientific agricultural literature the word fertilizer is confined to materials prepared artificially that supply nutrients to the plant, the word manure being more generally applied to substances like farmyard manure and lime that improve the soil in other ways besides supplying nutrients. Both groups will be dealt with in this article. (*See also SOIL; FEEDING STUFFS; GRASS AND GRASSLAND*; and the further list of headings under AGRICULTURAL ARTICLES.) The use of farmyard manure is probably as old as agriculture itself. Its discovery was already mythical in Roman times, and its properties and particularly those of composts were known in great detail to the Arabs and are fully described in their 10th century text book, *Kitab al-Falahah*, with some gruesome detail, as when the writer, in emphasizing the value of blood, as manure says, quite calmly, "the best of all is human blood." Lime was known from ancient times to the Celtic peoples and wood ashes both to them and to the Arabs. The older treatises in agriculture give much information also about substances like waste wool, bones, etc.

In the first 40 years of the 19th century chemists and botanists began studying the phenomena of plant growth and by 1844 the labours of Théodore de Saussure and other plant physiologists of the Geneva school, of Justus von Liebig in Germany, and of J. B. Lawes and J. H. Gilbert at Rothamsted had shown that all these substances fell into five groups, containing as their respective fertilizing constituents one or more of the following, namely, (1) nitrogen, (2) phosphorus, (3) potassium, (4) organic matter (mainly cellulosic material), and (5) calcium oxide. Of these the first three could be supplied from sources not previously drawn upon by farmers, and they could be manufactured into products easy to transport and to handle on the farm. These manufactured products became known as "artificial manures," or "artificial fertilizers," since shortened to "artificial." Their introduction into farming was in large part due to the enterprise of J. B. Lawes (*q.v.*) of Rothamsted, who in 1843 set up the first fertilizer factory and at Rothamsted afforded the first and still one of the most complete demonstrations of their value. They greatly improved the agricultural production of the time and played no small part in enabling Europe in general and England in particular to maintain the rapidly increasing population. They are now used all over the world in increasing quantities, not only to increase crop yields, but also to modify the composition or habit of growth of the crop so as to enable it better to withstand adverse conditions. The five groups will be dealt with in the order set out above.

(1) NITROGENOUS FERTILIZERS

In natural conditions a nitrate, probably calcium nitrate, is the source from which plants derive their nitrogen, but the changes in the soil are such that sodium or potassium nitrates are equally serviceable. Further, ammonia is rapidly oxidized to nitrate in the soil; hence ammonium salts, or any other compounds rapidly converted into ammonia, also supply nitrogen for plants. So far as is known, the ammonia is not generally assimilated direct, although some plants can do this: certain micro-organisms in the soil are so active, however, that the ammonia is converted into nitrate before the plant takes it up. The nitrogenous fertilizers are:

Nitrates: sodium (the most used); calcium (increasingly used); potassium (used only in horticulture).

Ammonium salts: sulphate (the most usual); phosphate (coming into use); chloride (valuable for certain crops).

Substances easily converted into ammonia: Calcium cyanamide (most used); urea (coming into use).

Effects of Nitrogenous Fertilizers.—Nitrogen starvation is characterized by stunted growth and sickly yellow colour of the leaf, the yellowing and dying being general all over the leaf, as distinct from the effect of potash starvation where the dying is from the tip and edges inwards. Addition of nitrate causes rapid improvement in its colour and growth. F. G. Gregory, working with barley, has shown that only the leaf area increases and not the assimilation rate, in contradistinction with phosphate and potassium, both of which increase the efficiency as well as the leaf area.

Greater quantities of nitrate lead to the development of large dark green leaves which are often crinkled, soft, sappy, and liable to insect and fungus pests, possibly because of the thinning of the walls or changes in tissues or in composition of the sap. C. R. Hursch shows that the amount of sclerenchyma is reduced in proportion to the collenchyma in the wheat plant, thus favouring the attack of *Puccinia graminis*, the mycelium of which can develop only in the collenchyma.

A further effect of a large supply of nitrogen relative to other nutrients is a retardation of ripening. Seed crops like barley that are cut dead ripe are not supplied with much nitrate, but oats, which are cut before being quite ripe, can receive larger quantities. All cereal crops, however, produce too much straw if the nitrate supply is excessive, and the straw does not commonly stand up well, but is beaten down or "lodged" by wind and rain. Swede and potato crops also produce more leaf, but not proportionately more root or tuber, as the nitrogen supply increases; no doubt the increased root would follow, but the whole process is sooner or later stopped by the advancing season—the increased root does, in fact, follow in the case of the later-growing man-

gold. Tomatoes, again, produce too much leaf and too little fruit if they receive excess of nitrate. On the other hand, crops grown solely for the sake of their leaves are wholly improved by increased nitrate supply: growers of cabbages have learned that they can not only improve the size of their crops by judicious applications of nitrates, but they can also impart the tenderness and bright green colour desired by purchasers.

Sources.—Prior to the World War, Chile was the main source of nitrate of soda, and coal of sulphate of ammonia. These were the two chief nitrogenous fertilizers. Synthetic fertilizers were obtainable, the industry having been founded as a result of Sir William Crookes's impressive address at the British Association in 1898, but they played only an insignificant part in farm practice. During the war, extensive factories for the preparation of ammonia or nitrate from atmospheric nitrogen were erected in Central Europe, and since the war in other countries also.

Three processes are used in the fixation of atmospheric nitrogen (*q.v.*). The arc process, yielding calcium nitrate, is almost limited to Norway, where water-power is abundant; the cyanamide process, used in Switzerland and other countries possessing water-power or coal; and a catalytic process, now becoming the most popular, usually a modification of the Haber process, which yields ammonia convertible into any of four compounds: the chloride by combining the process with the manufacture of soda; the sulphate by reaction with gypsum; nitric acid by oxidation; or urea by other processes. The net result of all these activities is to give the farmer two new nitrogenous fertilizers which he never had before the war, namely ammonium chloride and urea, and to increase enormously the total amount of fertilizers obtainable. Some idea of the position now, as compared with pre-war days, can be gathered from the following table of the world's output in the years 1903, 1912 and 1926-7.

World's Production of Nitrogen Compounds in Thousands of Metric Tons (2,000 lb.) of Pure Nitrogen

	(000's omitted)		
	1903	1912	1926-27
Chile nitrate	247	449	119.6
Sulphate of ammonia by-product . . .	121	277	340.3
Fixation industry:			
Arc process (nitrate of lime)	Nil	11	81
Cyanamide	Nil	20	180
Sulphate of ammonia	Nil	Nil	300
Other nitrogen compounds	Nil	Nil	133.4
	368	757	1,237.5

Further large increases in production are foreshadowed both in Germany and in Britain: in Germany the Stickstoff Syndikat, and in Britain, Nitram Ltd., controls the situation. The British works are at Billingham, near Stockton-on-Tees, owned by Synthetic Ammonia and Nitrates Ltd., a part of Imperial Chemical Industries Ltd., and are expanding rapidly.

Sodium Nitrate, usually called nitrate of soda, comes wholly from the rainless regions of Tarapacá and Antofagasta in the north of Chile, where it forms deposits near the surface of the soil. The deposits occur in detached areas stretching over a wide range; in spite of the large annual consumption there still remains a vast supply for the future. The crude nitrate is excavated by a process of trenching; it is then crushed, purified by recrystallization and put up in bags for the market. Recently, improved methods for extraction have been introduced, such as those of Gibbs, Butler, etc., in place of the older Shank's system still in use among many of the companies.

Nitrate of soda is very quick acting as a fertilizer and can be taken up immediately by the plant. It finds application in two cases: (1) in case of emergency, when young plants are suffering through the attack of a pest, or in cold weather; (2) in ordinary practice as a top dressing for the crop. It causes increases of practically all crops grown in Great Britain; the dressing applied varies from 1 cwt. per acre, suitable for wheat in spring or grass laid for hay, to 10 cwt. per acre used on the valuable early cabbage and broccoli crops in Cornwall.

Nitrate of soda readily washes out of the soil and must therefore not be applied until it is needed.

Nitrate of Lime.—This is made both in Norway and in Germany. The production in recent years averages 160,000 tons per annum, practically all of which is taken in Europe, consumption outside being negligible. It is used on wheat, oats, hay, barley, forage crops, sugar beet, cabbage and mangolds. The problem of transport and storage was at one time a difficulty but is now largely overcome. In north Europe, Scotland, and the northern counties of England special bags are used; but in the warmer and moister midland and southern counties barrels are better.

The older Norwegian nitrate of lime contained 13% of nitrogen; modern German material contains 15.5%; there is an English product, called "Nitrochalk," one grade of which contains 10%, the other 15.5%.

Sulphate of Ammonia.—Until recently this was made wholly from coal. This still remains an important source, but the synthetic processes now produce nearly as much, and will soon produce more. Until recently sulphate of ammonia has always contained free acid; not more than about 0.05%, insufficient to affect the soil though sometimes enough to rot the bags, make the sample rather sticky and prevent it drilling easily. The method of preparation has now been improved so that it turns out a "neutral" sulphate containing less than 0.02% of acid which can be dried better and therefore is slightly more concentrated than the old substance: it contains 21.1% of nitrogen or 25½% ammonia against 20.8% nitrogen or 25¼% ammonia. The chemical is very easy to drill, can be stored easily and is entirely free from stickiness. For home use it is excellent. In the export trade it has shown an unexpected tendency to cake, a disadvantage that can now apparently be overcome. Great Britain is the chief exporting country and the United States comes second; Spain, Japan, Java and France are the chief importing countries.

Sulphate of ammonia is used on all crops in Britain, particularly potatoes, for sugar beet and other crops in France, oranges in Spain, rice in Japan and sugar in Java. There is evidence that it could advantageously be used for cotton. The greatly increased output tends to force down its price and so to widen its range of effective use. Attempts are being made to extend its use on grass land by extensive manuring and close grazing, but the tests have not continued long enough to show whether the method is a financial success.

Sulphate of ammonia differs in two important respects from nitrate of soda. When applied to the soil it reacts with calcium carbonate, giving rise to calcium sulphate and ammonium carbonate. The calcium sulphate washes out in the drainage-water, but the ammonia does not, but becomes absorbed by some of the reactive constituents contained in the soil. The ammonia becomes nitrified by bacterial action, and presumably is changed to calcium nitrate through interaction with more calcium carbonate. The calcium nitrate, however, is not wholly retained by the plant; the calcium is left in the soil and reconverted into carbonate.

There still remains a loss of 100 lb. of calcium carbonate for each 132 lb. of ammonium sulphate applied, and on soils deficient in lime this becomes serious for two reasons: the lime is greatly needed for other purposes; and in its absence ammonium sulphate leaves an acid residue in the soil, the ammonium portion being more completely taken by plants than the rest. Now most agricultural plants will not tolerate this acidity, and in extreme cases completely refuse to grow. This remarkable action was first observed in 1890 by Dr. Wheeler at the Rhode Island experiment station, where it has been more fully studied than anywhere else. A few years later it was seen at the Woburn experimental farm and described by Dr. Voelcker.

Dressings of lime must therefore be given periodically to avoid this trouble.

The absorption of ammonia by the soil is an advantage in regions of torrential rainfall. Where nitrate of soda might be completely washed away sulphate of ammonia remains safely in the soil.

Urea.—This substance is now prepared synthetically and it promises to be a highly important fertilizer. It contains 47% of nitrogen, and is thus more than 2½ times as concentrated as

sulphate of ammonia and 3 times as concentrated as nitrate of soda, a great advantage for transport and cartage. In the soil it is rapidly converted into ammonium carbonate which is then oxidized to nitrate. It does not appear to give its best results when used as a top dressing, and is better put into the soil at the same time as the seed, and speedily covered up. It seems to be safe for all crops, and does not make the soil acid, nor does it cause poaching of heavy soils; indeed, it appears to be remarkably free from the indirect action on soil other fertilizers show.

Calcium Cyanamide (CaCN_2).—This is prepared by heating a mixture of calcium oxide and carbon to a high temperature in an electric furnace: the resulting calcium carbide is then heated in a stream of nitrogen. Great quantities are made in Sweden, Switzerland and Italy where cheap water power is available; there are also factories in Japan and elsewhere. Recently there have been important changes in the method of manufacture, and the modern product contains 19% of nitrogen and 60% of total lime, of which 22% is free and 38% is in combination as cyanamide. Practically all the nitrogen is in the cyanamide form.

In the soil it changes to urea, by a reaction not yet understood but apparently not brought about by micro-organisms: the urea then decomposes as described above. In some conditions, *e.g.*, in presence of an alkali, cyanamide polymerizes, two molecules joining together to form one of the dicyanodiamide, a substance which in any large quantity is poisonous to plants and also to the nitrifying bacteria, and in any case has nothing like the fertilizing value of cyanamide. The older samples were dusty and unpleasant to handle, but this difficulty is now overcome.

Cyanamide has a retarding effect on germination of rapidly germinating seeds if it is applied along with them but not if it is applied to the land a few days beforehand: this is, therefore, always recommended. It has the advantages of cheapness, of supplying calcium, and apparently, though this is not yet fully demonstrated, of producing grain in cereals without lengthening the straw so much as sulphate of ammonia would do. Its effects are being studied at Rothamsted and elsewhere.

(2) PHOSPHATIC FERTILIZERS

Four substances are in common use as phosphate fertilizers, namely, superphosphate, called acid phosphate in the United States; basic slag; mineral phosphate; and bones.

Acid or Superphosphate is historically, perhaps, the most interesting, as being the first artificial fertilizer to be made: the process, which was patented by J. B. Lawes on May 23rd, 1842, consists simply in treating ground rock phosphate with sulphuric acid so as to convert the tricalcic phosphate, $\text{Ca}_3(\text{PO}_4)_2$, into the more soluble compound to which the formula $\text{Ca}(\text{H}_2\text{PO}_4)_2$ is usually assigned: in addition calcium sulphate is formed. The following is the usual expression of the reaction; it is not, however, strictly correct:

The mixture of calcium sulphate, monocalcic phosphate and some free phosphoric acid constitutes the superphosphate. No separation is attempted, and the calcium sulphate or gypsum is left in: it not only does no harm but has itself some fertilizing value and indeed was much used in the past: it also serves to get the superphosphate into a dry condition because it absorbs water very completely. The process has attained a considerable degree of perfection, and allows of the production of a high-grade product, finely powdered and dry, free from many of the defects of the older samples.

British and continental makers largely use as raw material the North African mineral phosphates, but much of it comes also from the United States. In 1926 the imports of rock phosphate into Great Britain and the Free State of Ireland were:—

Florida	19,292 tons
Morocco	40,688 "
Algeria	82,267 "
Tunisia	175,238 "
Egypt	1,500 "
Belgium	1,875 "
France	
	320,860 tons

On an average 10 tons of rock phosphate give rise to about 18 tons of superphosphate instead of the theoretical 17.

It has been found convenient to standardize the various grades of superphosphate and sell them on a definite basis. The amount of soluble phosphate is determined by analysis as P_2O_5 , and the figure is then calculated as tricalcic phosphate. Thus the ordinary grade contains about 12% P_2O_5 soluble in water; this figure is then multiplied by 2.18 to convert it into tricalcic phosphate, $\text{Ca}_3(\text{PO}_4)_2$. Both figures are conventional in that superphosphate consists neither of P_2O_5 nor of $\text{Ca}_3(\text{PO}_4)_2$, but either figure does very well to express the amount of phosphate soluble in water.

The following grades are now in common use:—

"30% soluble"	containing	13.6% P_2O_5	(England and Wales).
"35% "	"	16.0% "	(Scotland).
"38% "	"	17.4% "	"

The 30% super is made from Tunisian phosphates (58/63%, Gafsa or Dyr); the 35% from Algerian (Constantine 65/68%) or Florida Pebble phosphate (70%); and the 38% from Morocco phosphate (75%).

In Britain superphosphate is mainly used for swedes and potatoes, but some is used also for cereals. Its first effect is to hasten the rate of growth of the seedling. It causes swedes and turnips more rapidly to pass through the first leaf stage and acquire their true leaves, and cereals more rapidly to begin tillering. The root system also develops well. Later on the swelling of the root of the swede and turnip and the heading out and ripening of cereals are both hastened by superphosphate. The earlier heading out of cereals has certain incidental advantages; the head of the barley receiving superphosphate emerges from its ensheathing leaves a few days in advance of those insufficiently supplied, and therefore has a better chance of escaping the attack of the larvae of the goutflies (*Chlorops taeniopus*, Meig) which, hatching from their eggs on the topmost leaf, crawl downwards, seeking the head for food. Addition of phosphate leads to no increase in the proportion of grain borne by the plant.

These effects are not observed in every season, nor are they always seen when farmyard manure has been applied. Fortunately for farmers, however, the years when superphosphate acts well are those when crops are low and when, therefore, the additional yield is worth more than is easily expressed in money terms. For if the farmer has insufficient food for his livestock in a bad year he must sell out at any price he can get, while if his food supply be adequate he can hold or sell whichever he pleases. As a bad root year is also commonly a bad grass year, he cannot usually meet the difficulty by changing from roots to hay. This valuable effect of superphosphate in bad seasons accounts for its popularity among farmers; it can be regarded as an insurance against loss of crop at a time when loss would be peculiarly galling.

Actual phosphate starvation occurs on some soils and its symptoms are very marked. Swedes and turnips are among the first crops to suffer: they may fail entirely unless farmyard manure is given: it was because of the importance of these crops in British agriculture that the introduction of superphosphate produced so great a revolution in British agriculture 80 years ago. Cereals and grass may grow where swedes fail, but not well. Phosphate starvation occurs on certain soils in many countries: in Britain, on some of the boulder clays. Cereals suffering from phosphate starvation have a stunted root system, especially in their early days, and even more stunted leaf and stem; total number of tillers and the number of tillers bearing seed both fall off. Similar stunting of the root and leaf is seen in phosphate-starved fruit trees.

Phosphate starvation markedly affects the composition of crops, lowering their nutritive value to animals and their special quality values to men. Over large areas of the world there are soils very deficient in phosphate. Such soils in parts of South Africa carry a natural herbage which causes deficiency diseases in cattle; the affected animals devour bones with great eagerness, even putrefying bones when the deficiency is pronounced, so that they become liable to a particular ptomaine poisoning. The obvious remedy is to feed the cattle with bone meal. Similar diseases occur in Australia, where also the arable lands show

astounding benefits from small dressings of phosphate. Great areas of land in the Middle West of the United States show marked response to phosphates. In the Rommey Marsh, the best fattening pastures are richer in phosphate than the poorer ones; this is generally true of England and France. G. Paturel has shown that the best wines contain most P_2O_5 (about 0.3 grm. per litre), the second and lower qualities containing successively less. Further, when the vintages for different years were arranged in order of their P_2O_5 content, a list was obtained almost identical with the order assigned by the wine merchants. W. A. Davis has emphasized the importance of phosphate supply for the indigo crop.

Excess of phosphate over the amount required to increase plant growth is liable to cause injury; instances have been recorded of barley in Suffolk and potatoes in Lincolnshire, while W. F. Gericke in California has shown that the greatest growth is attained by supplying phosphate in the early life of the plant and withholding it later.

Certain soil conditions seem particularly to call for phosphatic manure. Heavy soils usually respond well in all parts of Britain: as do the loams of the eastern counties and many of the Boulder clays. The most striking increases in Britain, however, are obtained on the fen soils of East Anglia. On the other hand sandy soils often show no response, and chalk soils may show but little.

In conclusion, superphosphate is used for:—

Crops: fodder crops generally,—especially swedes and turnips in Britain; and cereals in certain districts.
Soils: heavy soils, many Boulder clays, fen soils.
Seasons: hot and dry, cold and wet.

Phosphate of Ammonia ("Ammonophos").—The enormous developments of technical chemistry dating from the World War have led to the production of ammonium phosphate by a new and remarkable synthetic process. Gaseous nitrogen and hydrogen are combined by a catalyst forming ammonia, and mineral phosphate is heated with coke in an electric furnace to produce the element phosphorus. This is then burnt to form phosphoric oxide, which is combined with ammonia to form ammonium phosphate. The product is a soluble highly effective fertilizer, concentrated and therefore easy to transport. It undoubtedly has a great future and may indeed go far to displace superphosphate. It supplies only nitrogen and phosphorus to the plant, and therefore is not strictly comparable with superphosphate which supplies calcium and sulphur in addition. How far these are important in ordinary farm practice is not known, as in most of the experiments hitherto made they have been supplied without regard to their possible action.

Basic Slag.—This is a by-product in the manufacture of steel from pig iron, and is formed during that part of the process when the molten pig iron is heated in presence of air and lime, so that the various impurities are oxidized and the phosphorus converted into calcium phosphate.

Two processes are in use for effecting this oxidation. The older one, adopted in 1879, is the Bessemer process; the molten pig iron is run into a pear-shaped vessel known as the converter, and air is blown through it. The necessary high temperature is obtained mainly by the combustion of the phosphorus, silicon, etc. in the pig iron, hence the need for sufficient of these substances: ores containing phosphorus are therefore used and the Bessemer slag contains some 18% phosphoric oxide, equivalent to 40% tricalcic phosphate. In recent years another process, the Open Hearth Process, has almost entirely displaced the Bessemer process in Great Britain but not in Belgium, the heat for the molten pig iron being supplied by a flame of producer-gas so that phosphorus in the pig iron is unnecessary: none is therefore added and the slags contain usually only 7 to 14% phosphoric acid (P_2O_5) equivalent to 15.4 to 31% tricalcic phosphate.

Further, the open hearth slags are not usually as readily soluble in citric acid as those yielded by the Bessemer process. This happens particularly when the pig iron contains much sulphur. An excess of lime is required to remove the sulphur, and as this makes the slag infusible, fluorspar or calcium chloride is added to increase the fusibility. This treatment converts the phosphate

in the slag into a chlor- or fluorapatite insoluble in citric acid, hence the slags finally produced are more or less insoluble according to the amount of lime and flux added.

There are therefore three classes of basic slag available, namely, (1) Bessemer slag, containing phosphorus equivalent to 35-40% or more of tricalcic phosphate, and largely soluble in 2% citric acid. Usually 80% of the total phosphate is guaranteed to be soluble.¹ (2) Basic open hearth slag containing less phosphorus, equivalent to 18² to 30% tricalcic phosphate largely soluble (70% of the total phosphorus) in 2% citric acid, the first pourings being richer than the last. (3) Basic open hearth slag made by the use of lime and fluorspar, containing as much phosphate as the poorer members of the preceding class but only slightly soluble (40% or less, usually only 20% in 2% citric acid).

When basic slag was first obtained in the Bessemer converters in 1879 its fertilizing properties were not recognized, till John Wrightson in 1884 and 1885 made his field experiments at Ferryhill and at Downton, and Paul Wagner in 1885 began his systematic pot experiments at Darmstadt. Hereafter it gradually came into use and within four or five years could profitably be adulterated with mineral phosphates, to detect which Wagner devised the well-known citric acid test that, with certain modifications, has remained in force ever since. Another important character of basic slag is the fineness to which it is ground. General experience shows that 80% of the slag should pass through a sieve having 100 meshes to the linear inch; the official specification of the Institute of Mining and Metallurgy is that this should have an aperture of side 0.127 mm.

The Bessemer slag achieved a high reputation for its marked effectiveness on poor pasture land, the experiments of W. Somerville and D. A. Gilchrist at Cockle Park, Northumberland, and elsewhere, furnishing some striking, almost dramatic, examples. The open hearth slags of high solubility are equally effective. It has sometimes been urged that all grass land needs only treatment with slag to transform it into something vastly more productive, but further experience has shown that the improvement is strictly limited to certain types of soil conditions: improvement has resulted because wild white clover has developed in the herbage; there is no improvement, however, where the proportion of clover is already high, or where for any reason the clover cannot grow well in spite of the presence of slag. In the Rothamsted experiments improvement could not be obtained if the grass land was already so good that one acre yielded 200 lb. live weight increase in sheep during the grazing season. In the Cockle Park experiments the increase had been only 20 to 40 lb. per acre, and here, therefore, improvement was possible: after slag treatment the live weight increase was 80 to 100 lb. per acre.

Basic slag is not confined in use to grass land: it has given good results also on arable land. It is not entirely like superphosphate in its action. On heavy clays, on downland pasture and in wet situations, slag is generally better than superphosphate. For roots, potatoes, hops and other short season crops superphosphate is usually better than slag. In J. Hendrick's swede experiments at Aberdeen there was little to choose between them, though for equal amounts of phosphate applied superphosphate gave on the whole slightly larger increase in crop, but where "finger and toe" was prevalent it required the addition of lime. In the Irish experiments equal weights of basic slag and superphosphate gave approximately equal results.

The phosphorus is present in the slag as a silico-phosphate: R. Bainbridge adduces evidence that the chief constituent is silico-carnotite, $Ca_3(PO_4)_2 \cdot (CaO)_2 \cdot SiO_2$, which is completely soluble in 2% citric acid. But when fluorspar has been used in the manufacture a fluorapatite, $3Ca_3(PO_4)_2 \cdot CaF_2$, is formed, which is soluble only to the extent of 5% in 2% citric acid. It is shown at

¹There is a confusing difference in meaning of the phrase "30% (or other amount) soluble" as applied to basic slag and to superphosphate respectively. For basic slag it means that 30% of the total phosphate present is soluble in 2% citric acid, while for superphosphate it means that the amount of soluble phosphate would, if expressed as tricalcic phosphate, be 30% of the weight of the superphosphate.

²The lower grades of slag containing less phosphorus than corresponds with 15% tricalcic phosphate, are too poor to bear transport for agricultural purposes.

Rothamsted that fluorapatite has but little fertilizer value, and for a series of slags their effectiveness decreased as more and more of the phosphate was in the fluorapatite form. These experiments justify the use of 2% citric acid as a discriminating reagent in testing slags, though the action between the phosphate in the slag and the solvent is complicated by the presence of other soluble substances extracted from the slag. In consequence the indications are not quite sharp, and solubility results do not altogether agree with the results of field tests.

In the Rothamsted experiments made in several parts of Britain, slag of which the phosphate is of high solubility (60% or more) in 2% citric acid proved superior to those of low solubility (38% or less); slags of over 70% solubility varied among themselves in effectiveness but the variations showed no relationship with solubility; slags of less than 70% solubility also varied among themselves in effectiveness but the variations are usually related to and expressible by the solubility. Medium and low soluble slags appeared to be more efficient in the western counties of England than in the eastern, a difference which may be associated with the higher rainfall or the longer growing seasons.

Of the other constituents of basic slag the *calcium* is valuable, as also is its *oxide* but this occurs only in small amounts. The *manganese* is considered valuable in France but not in Britain; it appeared, however, to act beneficially on an acid millstone grit soil in Cheshire. Some of the constituents may be actually harmful to vegetation: a slag studied at Rothamsted lost in effectiveness when it was more finely ground than usual, apparently because the harmful constituents came more into prominence.

In general the slags of low solubility differ from those of high solubility more than the figures indicate, showing that the difference does not consist simply in the amount of soluble phosphate present. The low soluble slags behave in the field differently in kind and not simply in degree from those of high solubility and cannot be raised to their level of performance simply by increasing the dressing. These slags of low solubility still present difficult problems to the agriculturist.

FROM HALL, "ROTHAMSTED EXPERIMENT," BY COURTESY OF JOHN MURRAY

FIG. 1.—DIAGRAM SHOWING THE EFFECT OF FERTILIZERS ON GRASS. (A) GROWN WITHOUT MANURE. (B) AMMONIUM SALTS ALONE. (C) FULL MINERALS AND SULPHATE OF AMMONIA. (D) FULL MINERALS AND NITRATE OF SODA

Rock Phosphate.—In agricultural conditions where low costs of working are absolutely essential and high yields per acre are not so necessary, ground (but otherwise untreated) mineral or rock phosphate has often given sufficiently good results. On some of the acid soils of the United States, especially in the Middle West, notable results have been achieved by a combination of rock phosphate and clover: Cyril Hopkins in Illinois, and A. R. Whitson in Wisconsin have provided numerous demonstrations. In the north of England, north African phosphates ground so that 80% shall pass a sieve showing 120 meshes to the inch, and therefore finer than basic slag, have proved useful on arable land in increasing the development of clover in the seeds ley. Elsewhere acid moorland soils have responded to these phosphates. In all comparative experiments basic slag has given better yields, but considerations of transport may make the rock phosphate cheaper.

The following table gives the percentage of phosphate in some of the commoner minerals, in comparison with that in superphosphate and basic slag.

Mineral phosphate				
	North African	United States	Super phosphate	Basic slag
P ₂ O ₅	26.6-28.9* 29.8-31.2†	25-28†† 32-2§	13.6-17.4	8-18
Equivalent to phosphate	34.4** 58-63* 65-68† 75**	55-61†† 70§	30-38	18-40

* Tunisia (Gafsa, Dyr). † Algeria (Constantine). ** Morocco. †† S. Carolina. § Florida Pebble.

The chief use of rock phosphate is, however, for conversion into superphosphate and for this purpose it is highly desirable that the mineral should be as free as possible from iron and alumina. This consideration rules out many phosphatic deposits, which otherwise might have great value.

Bones.—Bones have long been applied as manure in isolated parts of the country, but they were not commonly used until the beginning of the 19th century. Such remarkable results were then obtained in certain districts, e.g., in Cheshire, that the demand became very great, and the rather large accumulations of the past in various parts of the world had to be drawn upon to satisfy it. The demand still continues; the butchers' shops, meat markets and marine store dealers of the great cities are ransacked to keep up the supply. In modern practice the bones are sent to the works, put on to a perforated band and sorted; clean shank bones are picked out for cutlery, hard bones for glue-making and the remainder for crushed bone: the separate batches are steamed at low pressure (15-20 lb.) to remove fat, nowadays a valuable commercial product. In some works the bones are degreased with benzene, and this process is more efficient than steam, so that the residual bonemeal is richer in nitrogen and in phosphate.

The bones intended for "bone meal" are then crushed and sorted into half-inch bones, quarter-inch bones and bone meal. The bones intended for glue, and the ends of the cutlery bones, are crushed and again steamed, but this time at a higher pressure (50 lb.), when most of the nitrogenous constituents are extracted as gelatine or glue. The residue can now be got into a very fine state of division and is sold as "steamed bone flour." Dissolved or "vitriolized bones" are made by treating bones with sufficient sulphuric acid to dissolve about half of the phosphate. The different products vary in composition, but typical analyses are:

	Nitrogen	Equivalent to ammonia	P ₂ O ₅	Equivalent to tricalcic phosphate
Raw English bones	5	6	22	48
Bone meal	3.5-4.5	4.2-5.4	20-25	43-55
Steamed bone flour	1-2	1-2.5	25-32	55-69
Dissolved bones	2-3	2.3-3.8	15-16	33-35

The bone manures can be used in any conditions in which superphosphate is effective: in general they are not as good but they are safer in the hands of the inexpert and therefore are probably better for use in gardens.

(3) POTASSIUM SALTS

The need for potassium salts in plant nutrition was recognized long ago by agricultural chemists. As early as 1840 Liebig had insisted on the fertilizing value of "salts of the alkalis," without, however, specifying precisely which was the most important. Lawes and Gilbert from the outset included these salts in their fertilizer trials and by 1852 had laid out field plots for comparing potassium, sodium and magnesium sulphates: these experiments soon showed that potassium salts had most value. Farmers did not, however, begin to use them as fertilizers for many years; the need on the farm was met by farmyard manure and by wood ashes, on light soils by salt, and on farms near the seashore by seaweed. It was about 1860 that the great deposits of potassium salts in the neighbourhood of Stassfurt in Saxony were first worked to supply agriculturists with definite potassic fertilizers, but little use was made of them in Britain till after 1890. The industry has developed and is now under the charge of the German Potash Syndicate.

Four potassium salts are available on the market: potassium sulphate; potassium chloride; a mixture of potassium and sodium, and, if from Stassfurt, magnesium chlorides known as kainit; and a mixture of the chlorides and sulphates of potassium, sodium and magnesium known as potash manure salts. Prior to sale all these are graded and standardized to contain definite amounts of potassium. The sulphate and muriate are sold on a basis of potassium equivalent to 48.5% K_2O , muriate (*i.e.*, impure chloride), also on a basis of 45% K_2O , kainit 12.5%. Potash manure salts are of several grades, from 20 to 30%. The world consumption was in 1926 equivalent to 1.4 million tons K_2O annually, of which Great Britain took 3% (40,000 tons K_2O).

Up till the time of the World War the Stassfurt mines supplied all the potassium salts used in the world, but during the war other sources were exploited in the various countries, notably flue dusts and other industrial wastes and residues in Great Britain and certain natural deposits in the Western United States. Most of these proved unsuitable for peace conditions and have not survived. Two only remain of importance: the Alsace potash mines, which differ from those of Stassfurt in that the salts are free from sulphates and from magnesium, consisting of potassium and sodium chlorides only, and the Searle's Lake and other deposits in California, which can now supply a potassic fertilizer free from boron, which caused difficulty when this particular source was first exploited. Attempts are also being made to exploit the potassium salts in the Dead Sea, but so far this is done only on an experimental scale.

The four potassic fertilizers above mentioned all have certain properties in common due to potassium; their differences arise from the salts and radicals associated with them. Four distinct effects are produced on the growing plant by potassium salts:—(i.) on the general health and vigour of the plant; (ii.) on the efficiency of the leaves for synthesising and translocating carbohydrates; (iii.) on certain processes occurring in leguminous plants; and (iv.) on the formation of grain.

The effect on the growth and vigour of the plant makes potassic fertilizers of considerable value in adverse weather conditions, especially in sunless seasons. If but little potash is supplied the potato crop becomes very dependent on the amount of sunshine during its growing period: at Rothamsted the lowest yield in the five years 1922–26 was 2.47 tons per acre in 1922, when there was also the lowest number (519) of hours of sunshine during the four months July to October inclusive, and the highest yield was 9.72 tons in 1923, when the hours of sunshine were also highest, numbering 708. But where potassic fertilizers were given, the loss of crop following the lack of sunshine was much less: the potash in some way making up for deficient sunshine and enabling the plant to produce a good crop in spite of the disadvantage of a bad season.

Another result of the increased vigour conferred by potassic fertilizers is that they increase the resistance of plants to fungus disease. At Rothamsted the wheat receiving much nitrogen but no potassium is, in certain years, very liable to rust, while the adjoining plot receiving the same amount of nitrogen and equally exposed to infection, but receiving potassic fertilizers, is much freer from rust. The mangolds receiving much nitrogen but no potassium are badly attacked by *Uromyces betae*, while those receiving potassium largely escape. The permanent grass receiving nitrogen but no potassium is much more liable to attacks of *Epichloe* than the neighbouring plot receiving potassium. The results suggest—and this is emphasized by the experiments of W. F. Bewley on the bacterial stripe disease at Cheshunt—that the important factor is the ratio of nitrogen to potassium: if this is too high the plant tends to become susceptible to fungus attack. It does not necessarily follow that potassium salts alter the physiological susceptibilities of the plant to the disease; their effect may be indirect, conditioned by the change in habit of growth or rate of maturation they bring about; more work is needed, however, to clear up this subject. (*See E. C. Stakman and O. S. Aamodt, Journal Agricultural Research, 1924, 27, 341–380, for a recent discussion of this aspect of the problem as applied to stem rust of wheat in the United States.*) Flax growers in the north of Ireland have found that potassic fertilizers decrease the liability of the plant to the attacks of the wilt organism. In T. Wallace's sand cultures of fruit trees (Long Ashton), omission of potassium caused a characteristic leaf scorch and premature defoliation: the shoot growth of apples was much restricted. W. W. Garner (Washington, D.C.) found that potassium deficiency caused a "chlorosis" of tobacco leaf characterized by leaf spotting and distinct from that following magnesium deficiency, while H. S. Reed and A. R. C. Haas (California) observed a bronzed appearance on the leaves of young orange trees suffering from potassium starvation.

The effect of potassic fertilizers in increasing the efficiency of the leaf as an agent for assimilating carbon dioxide and synthesising and translocating carbohydrates gives these fertilizers special importance for crops like potatoes, mangolds and sugar beet which depend for their value largely on the amount of carbohydrate per acre they can produce. On the mangold plots at Rothamsted a ton of leaf on plants receiving potassic fertilizers produces a much greater weight of root and of sugar than an equal weight of leaf receiving no potassium, especially when sufficient nitrogen is given to ensure adequate leaf area. In like manner the weight of potatoes and starch per acre are both increased by additions of potassic fertilizers. Potassic fertilizers are of great importance to sugar beet: indeed the possession of the world's supply of these fertilizers was an important factor in the development of the sugar beet industry in Germany.

Associated with these marked differences in crop there are great differences in the colours of the leaves especially towards the end of the season. The leaves of mangolds well supplied with potash are healthy green in colour, well spread out and gradually die and become yellow from the bottom row upwards as the season advances. Without potash, however, the mangold leaves are of an unhealthy dark green colour, crinkled and, instead of spreading out, they tend to bunch together; they do not ripen normally but tend to die late: the stems are often orange colour. The facts are clear, but the physiological explanation has not yet been given. The harmful effect of potash starvation on carbohydrate production does not seem to be the result of a pathological condition of the chloroplastids. H. S. Reed found that they remained normal for two months, and even increased in numbers in potash-starved algae.

For some reason not fully understood, the turnip crop, although a great producer of sugar, responds less to potassic fertilizers than do mangolds or potatoes. In general, cereals also respond but little: deficiency of potash is shown first by falling off in yield, and a slight rise in the percentage of nitrogen in the grain; later, however, when it becomes severe there is a shrinkage in size of the grain. These effects are most pronounced on light sandy, chalky and peaty soils: on these the need for potash seems

to be considerable.

A further effect of potassic fertilizers is to bring about a longer continuance of the growing period, and a longer functioning of the leaves; on some of the light soils fruit trees receiving potassic fertilizers retain their leaves in a green healthy state for some time after other trees have shed them. This extension of the vegetative processes seems to explain the retardation in maturation seen on lighter soils. An example of this is furnished by the North Carolina experiments on cotton, where phosphates markedly hasten maturation and potash equally delayed it. Cotton does not ripen all at once, but requires several pickings. The percentage of the cotton open at the first picking was nearly twice as great under phosphatic manuring as under potassic manuring.

The effects of potassic manures on leguminous crops are difficult to explain but very important in practice. All leguminous crops need potash, and especially clover where, as often in Britain, it is grown not by itself but in association with grasses. Lawes and Gilbert showed many years ago that in a mixed grass field, clovers have less capacity than the grasses for absorbing potassium from the soil, and in absence of potassic fertilizers they suffer from the competition; the potassium starved grass plots at Rothamsted contain notably less clover than those fully manured, the actual depression fluctuating according to the season.

In conclusion, potassic fertilizers are of special importance for:

Crops, sugar beet, potatoes, mangolds, leguminous crops, especially clover, and therefore meadow hay.

Soils, chalk, sands, peats.

Seasons, cold, sunless, dry.

Other conditions, to promote resistance to fungous diseases and to extend the period of vegetative growth.

Other Elements Associated with Potassium.—The potassic fertilizer being always a salt or mixture of salts the farmer is adding other substances besides potassium to the soil whenever he uses this fertilizer. *Potassium sulphate* supplies sulphur, an essential element of plant food which is always advantageous so far as is known, and particularly in semi-arid regions. This salt is the most certain in its effect. The chlorine supplied by *Muriate of potash* is not usually sufficient in amount to exert any particular effect, and in consequence this fertilizer is usually in humid conditions as effective as the sulphate, and being cheaper, it is more used by farmers. But where larger dressings are given, as when kainit is used, the chlorine may be harmful especially to potatoes, which are very sensitive. Mangolds and meadow hay are more tolerant, and to these crops kainit can be given.

(4) ORGANIC MANURES

The older kinds of manure, which are still the most important on the farm, are of animal and vegetable origin and contain much combustible organic matter: they are therefore called "organic" to distinguish them from the inorganic salts or "artificial fertilizers."

Far the most important is *farmyard manure*. This consists of the solid and liquid excretions from the animals, together with the litter. The solid excretions, or faeces, contain the undigested and indigestible parts of the food, which is made up of about half of the bulky food supplied to the animal (hay, straw, etc.) and a small part of the concentrated food (corn, cake, etc.). This material has resisted the attack of the digestive fluids in the animal and it also proves somewhat resistant to the decomposition agents in the soil. The liquid excretion, or urine, contains most of the nitrogen and potassium of the digested portion of the food which, after entering the circulation and being used by the animal, is excreted in a soluble form very useful for plant growth. The richest manure is therefore that which contains the most and richest urine, given by animals fed on much easily digestible food rich in protein, such as feeding cakes, meals, etc. But the richness of the urine also depends on the animal. Fattening animals keep back very little of their nitrogen—only about 5%—and pass most of it out in the urine. Growing animals and milch cows keep back considerably more, so that the urine is correspondingly poorer; consequently fattening animals make better manure than young stock or dairy cows. The litter plays a very important part: it absorbs the urine, and on decomposition it adds valuable fertilizing material to the manure. Straw, peat, moss and bracken are all used; of these straw is much the commonest and contains fair amounts of nitrogen and potassium, has considerable power of absorbing urine, and encourages a biological fixation of ammonia.

The composition of farmyard manure is in principle readily ascertained. Knowing the weight and composition of the food and litter, and deducting the food constituents retained by the animal, it is easy to calculate the amount of fertilizing materials in any particular lot of farmyard manure. Experiments by J. A. Voelcker, T. B. Wood and E. J. Russell show that the calculation does not come out right, the quantity of nitrogen found in the manure being usually about 15% less than was anticipated. The loss does not take place in the animal: physiological experiments have shown that the whole of the nitrogen of the food is excreted in the urine and faeces: the loss goes on through volatilization and the action of micro-organisms while the manure is in the stall and before it is removed. After making the allowance the total

Average Composition of Potash Salts

Grades	Sulphate of Potash (K ₂ SO ₄)	Chloride of Potash (KCl)	Sulphate of Magnesia (MgSO ₄)	Chloride of Magnesia (MgCl ₂)	Sodium Chloride (NaCl)	Sulphate of Lime (Gypsum) (CaSO ₄)	Corresponding amount of Pure Potash (K ₂ O)	Total Chlorine (Cl)
Kainit 14%	..	23.7	..	0.1	62.3	2.5	14.9	49.1

Sulphate of Potash—Purity 96%	97.2	0.3	0.7	0.4	0.2	0.3	52.7	0.6

Magnesium, present in German kainit and potash manure salts, but not in those from Alsace, is of advantage in some conditions not well known, so that its effects cannot be predicted. It has, however, proved beneficial on potatoes and sugar beet, and Garner has shown that tobacco plants suffering from shortage of magnesium become liable to a peculiar chlorosis known as "sand-drown."

quantity of fertilizing material in the heap can be accounted for. The amount per ton, however, depends on the amount of water present and this varies with the different animals; sheep and horses giving more concentrated urine and faeces than cattle and pigs.

In practice, however, farmyard manure is rarely used immediately it is made: it has generally to be kept as a matter of

convenience and it then undergoes two types of changes, mechanical or physiological losses through leaching and volatilization, and chemical changes resulting from the activities of the hosts of micro-organisms, including bacteria and fungi, that flourish in it. The decomposition brought about by these organisms is in large part an oxidation and it liberates much heat. Relatively dry manure, e.g. horse dung, rises considerably in temperature; wetter manure, like cow dung, does not because of the great amount of heat needed to warm up all the water present and because much water means little air. This production of heat involves the combustion of material in the heap so that there is a corresponding loss of dry matter. The loss of nitrogen may be considerable. At the high temperature—sometimes as high as 70° C—many of the micro-organisms cannot function and may be killed. H. Rege has shown, however, that some of the fungi present remain active at 50° C and upwards (*Annals Applied Biology*, 1927, vol. xiv, 1-44).

The changes fall into two groups. The cellulose is decomposed by some of the organisms, notably certain fungi, and forms humus, a black sticky substance of great value in soil fertility because of its useful effects on the physical properties: tilth, and the power of holding moisture. To effect this decomposition of cellulose the organisms require a supply of easily available nitrogen, i.e., ammonia and amides, and therefore the process goes best when the animals have received cake and meal and the urine is all saved in the heap. The nitrogen taken by the organisms is converted into their cell substances; this causes a loss of soluble but a gain of insoluble nitrogen.

The nitrogen compounds of the manure undergo opposite kinds of changes. (1) If much nitrogen is present ammonia is formed, some of which is lost by volatilization and some is assimilated by the micro-organisms as stated above. (2) If but little nitrogen is present the preceding changes are reduced to a minimum and there is a tendency for nitrogen to be assimilated from the air by certain bacteria. (3) Complex insoluble nitrogen compounds in the manure tend to break down to ammonia. (4) Ammonia tends to be assimilated by the organisms decomposing the cellulose, and converted by them into complex insoluble compounds.

In consequence of these various changes farmyard manure, whatever its original content of nitrogen compounds, tends to become more uniform in composition on storage.

These changes take place whether the manure is stored in heaps or is ploughed into the soil. They are greatest in heaps to which air is admitted: they are least when air is excluded. The losses vary in the same way. They are least when air is excluded and the heap sheltered from the rain, in a compact heap stored under cover, or, what comes to the same thing, in manure made and kept under the animal. They become greatest, amounting to 40% or more, when the manure is made in open yards and then loosely packed into heaps and exposed to rain in the open. Some amount of change is unavoidable, and the rise of temperature has the great and increasing value that it kills weed seeds always present in the manure. But it is desirable to minimize the losses and in order to do this the following general rules should be observed.

Manure Made from Fattening Beasts.—If this is made in covered yards it should be left under the beasts until it is wanted. Defective roofing and spouting should be made good so far as possible to avoid washing by rain. If made in open yards the manure as soon as convenient should be hauled out and lightly clamped.

The clamp should be so placed that it is not unduly exposed to rain; shelter should if possible be provided in the form of a layer of earth, thatched hurdles, corrugated iron sheets, etc. If any black liquid is running away it is a sign that shelter is insufficient and that wastage is going on. It is not sufficient to collect the liquid, though this should be done; steps should be taken to provide more shelter also. The clamp should not be disturbed until it is wanted.

Manure Made from Dairy Cattle.—This has usually to be thrown out daily. It should be well protected from rain. The worst plan is that seen in some of the northern dales of England,

where the manure is thrown out of a hole in the wall and left exposed to weather, with the result that streams of black liquid flow away. A much better plan is to cart the manure to a dung-heap as is done in other parts of the country.

Liquid Manure.—Special care should be taken of the liquid manure draining from the cowsheds. This should be run into a tank and applied when convenient to the land. It may go on to grass land at almost any time, and to arable land after the autumn and before the middle or end of May. It is specially rich in nitrogen and potassium.

Time of Applying Farmyard Manure to the Land.—On heavy soils it is best to plough in the manure in autumn, winter or early spring in the "long" or fresh condition. The undecomposed straw helps to keep the soil open, it facilitates drainage and the action of winter frost. Losses of nitrogen compounds are reduced to a minimum: any decomposition of cellulose or other non-nitrogenous compounds is an advantage since it leads to assimilation of soluble nitrogen compounds which would otherwise be lost during the winter.

On light soils the "long" manure should not as a rule be ploughed in later than winter or it may bring about too much evaporation of water: the manure should be left to decompose in the heap before it is applied to the land. In districts of high rainfall this objection disappears, and spring applications of manure (provided it has been well stored) gives better results than winter applications.

Value of Cake Feeding.—From the foregoing it is clear that the feeding of cake to the animals enhances the value of the manure by enriching it in soluble and therefore available nitrogen compounds and by facilitating the conversion of the straw into highly valuable humus. "Cake-fed dung," to use the farmers' expression, is therefore of great value and is much prized on the farm. Unfortunately under present conditions its cost of produc-

tion is so great that it can hardly if ever be profitable. Many experiments have shown that its advantage over ordinary dung persists only for two years, and the difference in cost is rarely recovered in this period.

Unexhausted Values.—Since the effects of farmyard manure are not exhausted in one year, but persist over several, the custom has grown up in Britain, and is now enforced by law, of giving compensation to farmers quitting their holdings for manure they have applied to the land. The first tables for the guidance of valuers were drawn up by Lawes and Gilbert in 1870; they have been periodically revised and were reissued in 1914 by J. A. Voelcker and A. D. Hall, who recommend that compensation should be payable in respect of half the nitrogen and three-quarters of potash and phosphoric acid contained in the food, it being supposed that the remainder is lost. (*Journal Royal Agricultural Society*, 1914, lxxiv, 104.)

FROM RUSSELL, "SOILS AND MANURES" (UNIVERSITY PRESS, CAMBRIDGE)

FIG. 2.—EFFECT OF PHOSPHATES AND NITROGENOUS FERTILIZERS ON SWEDS IN PRESENCE OF POTASSIC FERTILIZERS

(A) No manure. (B) Superphosphate and potassic fertilizer. (C) Sulphate of ammonia, superphosphate and potassic fertilizer

Farmyard Compared with Artificial Manures.—When artificial fertilizers were first introduced, chemists felt much justifiable pride in their discovery. In Lawes's and Gilbert's first experiments the complete artificial manures had actually given larger yields of wheat and barley than had farmyard manure and although Lawes and Gilbert themselves did not urge that artificials were better than farmyard manure, some of their successors did so. The great French agricultural chemist, Georges Ville, went

so far as to assert that farmyard manure was unnecessary and could in practice be economically replaced by artificial manures.

Practical men in Great Britain never accepted this view but maintained that farmyard manure was more effective than artificial fertilizers and came in for some abuse for their supposed prejudice against new ideas and scientific discoveries. As time went on, however, it appeared that the superiority of artificial to farmyard manure was not permanent. For the first few years the artificials considerably enhanced the fertility of the soil, but after a time their effect began to fall off. Farmyard manure, on the other hand, shows no such falling off and is more effective in permanently maintaining fertility. Crops receiving it are less liable to suffer from seasonal factors than those receiving artificials only, so that the fluctuations in yield from season to season are less marked on the farmyard manured plot. Again some crops seem to respond markedly to farmyard manure. Clover, one of the most important crops in Great Britain, is an example: it responds better to farmyard manure than to any combination of artificials yet tested, giving not only a better yield of clover hay but also enriching the ground and so improving the succeeding crop. Gooseberries were shown by Spencer Pickering at the Woburn fruit farm to respond better to farmyard manure than to artificials and a similar result is shown by citric fruits at Riverside, California. These and other experiments prove that farmyard manure has important effects on plant growth which are not produced by artificial manures.

The effects are something more than nutrition with nitrogen, potassium and phosphate: at Askov in South Jutland a comparison between farmyard manure and artificial fertilizers containing the same amount of plant nutrients has shown that the nutrients in the farmyard manure have only about half the value of those in the artificial fertilizers. The composition of farmyard manure is as under:—

	Ammoniacal nitrogen	Total nitrogen	Dry matter	Ash	P ₂ O ₅	K ₂ O
Bullocks (cake fed)	0.181	0.773	27.40	5.72	0.389	0.601
Bullocks (no cake)	0.040	0.540	27.20	9.47	0.235	0.670
Dairy cows	0.091	0.427	19.44	4.17	0.193	0.436
Horses	0.084	0.536	26.87	4.98	0.231	0.535

Sewage Sludge.—Unfortunately no practicable means of realizing the value of sewage has yet been devised. Broad irrigation and sewage farming answer under certain conditions, but not as general methods of treatment. The only material generally available is the sludge which is prepared by some precipitating or settling process, and it contains therefore only the insoluble compounds and not the soluble and valuable nitrates, ammonia, etc. It is usual to add a certain proportion of lime and then to force the mass into presses, when it forms a cake containing roughly 50% of water, 15 to 25% of organic matter and 25 to 35% of mineral matter much of which is lime, and about 1% each of nitrogen and of P₂O₅. This is not usually of much fertilizing value. At some places other wastes and residues are added to enrich the sludge and in some northern towns a process is at work to extract the fat, grease, etc., which in modern times have become too precious to lose even in sewage: the resulting products contain respectively 2 and 3½% of nitrogen and are of distinct fertilizer value. The best of these materials is the so-called activated sludge prepared by blowing air through the sewage; this has a very different character from the older types and contains as much as 5% or more of nitrogen and over 4% of P₂O₅; it is a promising fertilizer.

Other Organic Manures.—Broadly speaking any animal or vegetable material can be used as manure, and if it can be made to contain more than 5% of nitrogen it may become an article of commerce: poorer materials rarely pay for transport. The guanos are the droppings of sea birds, feathers, etc., gathered from small islands off Peru, South Africa, and elsewhere. Fish and meat guanos are prepared from fish and meat unsalable as human or

animal food, the fat having been wholly or partly removed. Various seed meals (rape, etc.) are residues left after extraction of oil and for some reason unsuited for animal food. Shoddy is a waste material from the Yorkshire mills which tear up old cloth and woollen rags to make them into new cloth. All these have fertilizer value though they are more appropriate for special purposes than for ordinary farming. Their composition varies, but the following are typical figures:—

Material	Nitrogen	P ₂ O ₅	Equivalent to tricalcic phosphate	K ₂ O
Peruvian guano, high grade	10-14	9-11	20-24	2-4
Peruvian guano, ordinary	5-8	14-18	30-40	2-4
Peruvian guano, phosphatic	2.5-3.5	18-32	40-70	2-6
Fish guano	8-10	4.5-9	10-20	1
Meat guano, high grade	8-9	4.6-7	10-15	..
Meat guano, phosphatic (bone added)	5-6	11.5-16	25-35	..
Oil cakes: about	5	2	4	1
Shoddy	5-12

(5) LIME, LIMESTONE AND CHALK

These substances act in two ways: they supply calcium as a base, and they improve the physical condition of the soil. The need for calcium arises from the circumstance that fertile soils are rich in exchangeable calcium (*see SOIL*); if this becomes displaced by hydrogen, a common occurrence in natural and farm conditions, a sour or acid soil is found unfavourable to vegetation. These sour soils are widely distributed in nature and they are dealt with either by using them only for crops tolerant of acidity, or by treatment with lime or limestone to supply the necessary calcium.

Lime and limestone are very effective on heavy arable soils, and they are often needed on lighter arable soils also: the need is indicated by partial failure of clover and by the prevalence of "finger and toe" (*Plasmiodiophora*) on the swede turnip or other crop of the *Brassica* family. They are less certain in effect on grass land especially where basic slag is used: instances of successful use of lime are found in the north of England.

There being no necessity for purity, farmers often use impure lime or limestone so long as it is sufficiently cheap. It should, however, always be bought on analysis: samples of lime may contain 80-95% calcium oxide, limestone may be of 95% purity.

Waste lime from various factories is sometimes available. The differences in action between lime and limestone are essentially minor and the choice between them is determined mainly by considerations of cost and transport. Both should be somewhat finely ground before being applied, and if possible both should be applied in winter or early spring. Lime is fatal to certain animal pests, slugs and others, and should be used if they are of importance. The rate of application should be adjusted to the need which can be approximately estimated by modern analytical methods.

(E. J. R.)

BIBLIOGRAPHY.—Selected bibliographies to the vast periodical scientific literature of the subject will be found in S. H. Collins, *Plant Products and Chemical Fertilizers* (2nd ed., 1926) and Sir E. J. Russell, *Soil Conditions and Plant Growth* (5th ed., 1927). Reports of the Rothamsted and Woburn experimental stations may be read in Sir A. D. Hall, *The Book of the Rothamsted Experiments* (2nd ed., 1919) and the *Journal of the Royal Agricultural Society*, respectively. Among general works or special monographs the following may be consulted: H. Ingle, *A Manual of Agricultural Chemistry* (4th ed. 1920); G. S. Robertson, *Basic Slags and Rock Phosphates* (1922); Sir E. J. Russell, *Manuring for Higher Crop Production* (2nd ed., 1917); *A Student's Book on Soils and Manures* (2nd ed., 1919); *Farm Soil and its Improvement* (1923); and T. B. Wood, *The Chemistry of Crop Production* (2nd ed., 1924).

United States.—In the United States, practice in the production and application of fertilizers differs somewhat from that of Great Britain and the Continent. Mixed or "complete" fer-

tilizer is usually used. This contains, as a rule, all three of the essential fertilizer elements—nitrogen, phosphorus and potassium—in some definite ratio. All the fertilizer materials may be applied simultaneously in this way with a resulting saving of time and labour.

In making mixed fertilizers in America most of the materials which are described in the article above are utilized. Usually, superphosphate (acid phosphate) is manufactured at the factory and the other raw materials assembled. These are mixed with the superphosphate. In the United States superphosphate (acid phosphate) is graded according to the amount of available phosphoric acid (P_2O_5) it contains, which includes not only P_2O_5 soluble in water but also that which is soluble, under certain very definite conditions, in a neutral solution of ammonium citrate of 1.09 specific gravity. Ordinarily, from 75 to 85% of the available phosphoric acid is water soluble. The grades produced range from 16 to 20% available phosphoric acid. There is, also, a growing use for so-called double or treble superphosphate, which contains from 40 to 50% available phosphoric acid. This is prepared by acidulating phosphate rock with liquid phosphoric acid instead of with sulphuric acid.

The various ingredients of a mixed fertilizer must be chemically compatible, otherwise both the chemical and physical condition of the finished product would be seriously impaired. If improper mixtures are made, loss of nitrogen and reversion of available phosphoric acid to an insoluble form may occur and the product may become hard and lumpy instead of remaining fine and granular. The physical condition of the mixture is of much importance as it affects the ease and uniformity of distribution on the farm. Often mixtures are allowed to stand in storage for some weeks before bagging and shipping to permit the completion of chemical reactions among ingredients. The "cured" fertilizer is then milled to break up lumps before being bagged and shipped. Nitrogenous organic materials such as slaughter-house tankage, dried blood, cotton-seed meal, etc., have a decidedly beneficial effect on physical condition. These materials, however, are comparatively expensive as nitrogen carriers, and, in general, only the off-grade products, unfit for use in animal feeding-stuffs, find their way into fertilizers. Tankage from garbage, sewage and industrial wastes are also used. The present day trend, however, is distinctly away from extensive use of organic materials in mixed fertilizers.

The greatest quantity of fertilizer is used in the south-eastern States under cotton. Tobacco, too, is treated heavily, and potatoes in certain sections, as in Maine, require liberal amounts. In some sections of the east and south, it is used extensively with truck and cereal crops, but in the great cereal raising States of the middle west very little fertilizer is, as yet, consumed. In the fruit-growing districts of California and Florida fertilizer is required. In 1928 between 7 and 8 million tons of fertilizer were used annually in the United States. Owing to diverse requirements of widely separated localities a system has developed in the United States whereby comparatively small fertilizer works are situated in consuming districts catering to the special needs of each neighbourhood. Some of these works manufacture their own sulphuric acid, superphosphate (acid phosphate) and mixed fertilizers; others buy acid and make superphosphate (acid phosphate) and mixed fertilizers; while still others are merely mixing units, buying all the fertilizer ingredients. Formulae used for mixed fertilizers vary widely, depending on kind of crops, types of soil and local prejudices, so that many brands are on the market. Until recently the more popular formulae were of comparatively low analysis such as: 1.65% nitrogen (N_2), equivalent to 2% ammonia (NH_3), 10% phosphoric acid (P_2O_5), 2% potash (K_2O) and 2.48% N_2 (3% NH_3), 9% P_2O_5 , 3% K_2O . The present trend, however, is toward higher grade goods, such as: 4.12% N_2 (5% NH_3), 15% P_2O_5 , 5% K_2O and 3.3% N_2 (4% NH_3), 16% P_2O_5 , 4% K_2O . Experiments are being made throughout the world on the direct application to the soil of concentrated materials such as urea, ammonium phosphate and mixtures containing between 50 and 70% of nitrogen, phosphoric acid and potash. It is possible that in the future such mixtures will replace to a great extent the "complete" fertilizer combinations in use to-day.

The *Journal* of the Association of Official Agricultural Chemists contains many important contributions to the literature of fertilizer chemistry. See also the division of fertilizer chemistry of the American Chemical Society; A. F. Gustafson, *Handbook of Fertilizers*, 1928; Collins and Redington, *Plant Products*, 1926.

(H. H. ME.)

FESCENNIA, an ancient city of Etruria, probably immediately north of the modern Corchiano, 6 m. N.W. of Civita Castellana (see **FALERII**). At Corchiano itself, however, Etruscan walls may be traced, and the site is strong—a triangle between two deep ravines, with the third side cut off by a ditch.

FESCENNINE VERSES, *Fescennini versus*, *carmina Fescennina*, a native Italian form of poetry. At vintage (Virgil, *Georg.*, ii. 385) and harvest (Horace, *Epp.*, ii. 1, 139), probably at other rustic festivals also (*cf.* Tibullus, ii. 1, 51), masked dancers sang jocular dialogues in verse. Similar songs were in use at weddings (Festus, p. 76 Lindsay; Symmachus, *Orat.* iv. 13). According to Horace, they became so abusive that a law was passed to check them; apparently the provision of the Twelve Tables (viii., 1 Bruns) which forbade a *malum carmen* (evil song, i.e., charm intended to hurt) was stretched to include libellous verses. We also know (see the literary imitations, Catullus lxi., 126 ff., Claudian xi.-xiv.) that they were very free, to our notions obscene, in language. Further, Festus (*loc. cit.*) says that they averted the evil eye and that therefore some connected the name with *fascinum*. This derivation, philologically most unlikely, is supported by one or two moderns, who suppose *fascinum* to have the sense of "phallus," not "evil eye." The true derivation is in all probability from Fescennia; but we may very reasonably suppose that in their origin they had a magico-religious intent, abuse, buffoonery, and obscenity being well-known fertility or luck charms. That they developed into the dramatic *satura* and thus gave birth to the beginnings of a native drama is implied in Livy, vii., 2, 7, but has been seriously doubted in modern times; *cf.* LATIN LITERATURE.

See Schanz-Hosius, *Gesch. der röm. Literatur* (bibl.).

FESCH, JOSEPH (1763–1839), cardinal, was born at Ajaccio, Corsica, on Jan. 3, 1763. He was connected with the Bonaparte family by his father's second marriage with Laetitia Bonaparte's widowed mother. At the outbreak of the French Revolution, he was archdeacon of Ajaccio; he protested against the application to Corsica of the act known as the "civil constitution of the clergy" (July 1790). On the suppression of religious orders and corporations, he had to retire into private life.

He was drawn by the Bonaparte family into espousing the French cause against Paoli and the Anglophiles, and accompanied Laetitia and her son to Toulon, in the early part of the autumn of 1793. His fortunes rose rapidly when Napoleon became First Consul (Nov. 1799). He resumed his clerical vocation, and took an active part in the complex negotiations which led to the signing of the Concordat with the Holy See on July 15, 1801. He was then made archbishop of Lyons (1802), and cardinal (1803).

In 1804 he succeeded Cacciault as French ambassador at Rome. He was assisted by Châteaubriand, but soon sharply differed with him on many questions. His tact in overcoming the reluctance of the pope to be present at the coronation of Napoleon in Notre Dame, Paris (it was only eight months after the execution of the duc d'Enghien) was rewarded with further honours. Finally, in 1806 Karl von Dalberg, then prince bishop of Regensburg, chose him as coadjutor and designated him as his successor. Before the succession fell vacant, however, Regensburg had been incorporated in Bavaria.

By this time Napoleon was in sharp collision with the pope on various matters both political and religious. Fesch, who was still ambassador in Rome, went as far as possible in counselling the submission of the spiritual to the civil power. For a time he was not on speaking terms with the pope; but Napoleon was dissatisfied, and recalled him.

Affairs came to a crisis when Napoleon decreed (May 17, 1809) the annexation of the papal states to the French empire. In that year Napoleon conferred on Fesch the archbishopric of Paris, but he refused the honour. In 1811 Fesch presided over a Gallican

church council convened by the emperor, but failed to satisfy Napoleon, and was dismissed to his diocese. Next year Napoleon intercepted a letter from Fesch to Pius VII., who was then detained at Fontainebleau, and there was a serious breach. The tension between Fesch and the emperor was less in 1812–13. During the Hundred Days Fesch resumed his archiepiscopal duties at Lyons and became a member of the senate. On the second abdication Fesch retired to Rome. He left many works of art to the city of Lyons. He died at Rome on May 13, 1839.

See Ricard, *Le Cardinal Fesch* (1893); H. Welschinger, *Le Pape et l'Empereur* (1905); F. Masson, *Napoléon et sa famille* (4 vols., 1897–1900), this correspondence with Napoleon was edited by Ducasse (1855).

FESCUE, the name given to the numerous and widely distributed perennial grasses of the botanical genus *Festuca*, found chiefly in temperate and cold regions, among which are several pasture and fodder grasses of agricultural importance. The most important of these is the tall or meadow fescue (*F. elatior*) common throughout Europe and in parts of Asia and widely cultivated and naturalized in the United States and Canada. It grows to a height of from 2 ft. to 5 ft., and is regarded as one of the most valuable grasses both for fodder and for permanent pasture. The red fescue (*F. rubra*), found throughout cool north temperate regions, is sometimes grown in meadows. The sheep's fescue (*F. ovina*), native to the Himalayas and certain mountainous districts of Europe and North America, and widely naturalized in north temperate regions, is sometimes used in dry pastures and a form called the blue fescue (var. *glauca*), with silvery-glaucous leaves, is grown for ornament.

The closely allied genus *Bromus*, which includes the brome grasses, is abundantly represented in north temperate regions, and various species are grown for forage and for ornamental purposes. Among those important agriculturally are the erect brome (*B. erectus*), useful as a forage grass on dry, chalky soil, and the awnless or Hungarian brome (*B. inermis*), grown for pastures and meadows. (See GRASSES.)

FESSA, a town and district of Persia in the province of Fars. The town is situated in a fertile plain in 29° N. and 90 m. from Shiraz. The district comprises forty villages and extends about 40 m. north-south from Runiz to Nasirabad and 16 m. east-west from Vasilabad to Deh Dasteh (Dastajah); it produces much grain, fruit and tobacco.

FESSE, one of the ordinaries in heraldry consisting of a horizontal band across the centre of the shield. See HERALDRY.

FESSENDEN, WILLIAM PITT (1806–1869), American statesman and financier, was born in Boscawen, N.H., on Oct. 16, 1806. After graduating at Bowdoin college in 1823, he studied law, and in 1827 was admitted to the bar, eventually settling in Portland, Me., where for two years he was associated in practice with his father, Samuel Fessenden (1784–1869), a prominent lawyer and anti-slavery leader. In 1832 and in 1840 Fessenden was a representative in the Maine legislature, and in 1841–43 a Whig member of the national House of Representatives. When his term in this capacity was over, he devoted himself with great success to the law. He became well known, also, as an eloquent advocate of slavery restriction. In 1854 he was chosen by the combined votes of Whigs and Anti-Slavery Democrats to the United States Senate, where he delivered a speech in opposition to the Kansas-Nebraska bill which made him a force in the congressional anti-slavery contest. He was re-elected to the Senate as a member of the Republican party. As chairman of the Senate committee on finance, his services were second in value only to those of President Lincoln and Secretary Salmon P. Chase in efforts to provide funds for the defence of the Union; in 1864 Fessenden succeeded Chase as secretary of the Treasury. The finances of the country in the early summer of 1864 were in a critical condition; a few days before leaving office Chase had been compelled to withdraw from the market \$32,000,000 of 6% bonds, on account of the lack of acceptable bids; gold had reached 285, while the value of the paper dollar had sunk as low as 34 cents. It was Fessenden's policy to avoid a further increase of the circulating medium, and in spite of powerful pressure the paper

currency was not increased during his tenure of office. As the sales of bonds and treasury notes were not sufficient for the needs of the Treasury, interest-bearing certificates of indebtedness were issued to cover the deficits. When these began to depreciate Fessenden engaged the services of the Philadelphia banker Jay Cooke (q.v.) and secured the consent of Congress to raise the balance of the \$400,000,000 loan authorized in 1864 by the sale of the so-called "seven-thirty" Treasury notes (i.e., notes bearing interest at 7.3% payable in currency in three years or convertible at the option of the holder into 6% 5–20 year gold bonds). Through Cooke's activities the sales were enormous; the notes, issued in denominations as low as \$50, appealed to the patriotic impulses of the people who could not subscribe for bonds of a higher denomination. In the spring of 1865 Congress authorized an additional loan of \$600,000,000 to be raised in the same manner, and for the first time in four years the Treasury was able to meet all its obligations. After thus securing ample funds for the enormous expenditures of the war, Fessenden resigned the Treasury portfolio in March 1865, and again took his seat in the Senate, serving till his death. He was not, however, entirely in accord with the more radical members of his own party, and this difference was exemplified in his opposition to the impeachment of President Johnson and subsequently in his voting for Johnson's acquittal. He died at Portland, Me., on Sept. 6, 1869.

See Francis Fessenden, *Life and Public Services of William Pitt Fessenden* (Boston, 1907).

FESSLER, IGNAZ AURELIUS (1756–1839), Hungarian scholar, was born on May 18, 1756, at Zurány, Hungary. He became a capuchin, and made many enemies by exposing the abuses of the monasteries to the emperor, Joseph II., who ordered a searching examination in consequence. He held a chair at Lemberg university for a short time, but had to leave Hungary after the publication of his tragedy *Sidney* (1788), attacking the English Roman Catholics. He was converted to Lutheranism, and wandered from place to place. In 1796 he was in Berlin and was commissioned, with Fichte, to reform the statutes of the free-masons' lodge there. In 1809 Alexander I. offered him a chair at St. Petersburg (now Leningrad), of which he was soon deprived on account of his heterodox opinions. In Nov. 1820 he was appointed consistorial president of the evangelical communities at Saratov, and subsequently became superintendent of the Lutheran communities in St. Petersburg. Fessler died at St. Petersburg on Dec. 15, 1839.

Among his numerous works are *Die Geschichten der Ungarn und ihrer Landsassen* (10 vols., Leipzig, 1815–25); *Mathias Corvinus* (2 vols., Breslau, 1793–94); *Die drei grossen Könige der Ungarn aus dem Arpadischen Stamme* (Breslau, 1808); and the autobiographical *Rückblicke auf seine siebenjährige Pilgerschaft* (Breslau, 1824; 2nd ed., Leipzig, 1851). See J. Koszö, *A. I. Fessler* (1923).

FESTA, CONSTANZO (c. 1495–1545), Italian singer and musical composer, became a member of the Pontifical choir in Rome in 1517, and soon afterwards *maestro* at the Vatican. His motets and madrigals (the first book of which appeared in 1537) excited Dr. Burney's warm praise in his *History of Music*; and, among other church music, his *Te Deum* (published in 1596) is still sung at important services in Rome. His madrigal, called in English "Down in a flow'ry vale," is well known.

FESTINIOG or FFESTINIOG, a town of Merionethshire, North Wales, beautifully situated at the head of the Festiniog valley, 600 ft. above sea level. Pop. of urban district (1931) 9,072. There are important slate quarries in the neighbourhood, especially at Blaenau Festiniog, the junction of the L.M.S. and G.W.R. with a narrow-gauge line between Portmadoc and Duffws. This light railway runs at a considerable elevation (some 700 ft.), commanding a view across the valley and Tan y Bwlch lake. The Cynfael falls are famous. Near are *Beddau gwyr Arduwly* (the graves of the men of Arduwly), memorials of early warfare. The slate industry was very depressed in 1928.

FESTIVALS, MUSICAL. In various forms musical festivals have been held for some centuries. No doubt the earliest examples owed their origin mainly to the difficulties of travel, which led the musicians in a wide area to concentrate their activities periodically at some convenient centre. Inevitably, too, such

music-makings were connected with the Church, to which most musicians and performing bodies were attached.

Both custom and title seem to have originated in England, where the earliest gathering of the kind appears to have been the *Festival of the Sons of the Clergy*. Founded in 1655, with the object of assisting necessitous clergy and their dependents, this gathering has been held annually in St. Paul's Cathedral, as one of the most important church-music events in London. The *Three Choirs Festival* dates from 1724—perhaps a little earlier. That year, at all events, saw it first coming into prominence, with a performance at Gloucester of a cathedral service on an imposing scale with orchestral accompaniment. It owed its inception largely to the Rev. Thomas Bisse, Chancellor of Hereford and brother of the bishop of that diocese. The proceeds were given to a fund for the widows and orphans of the poorer clergy of the Hereford, Gloucester, and Worcester dioceses. The meetings were held in turn at each of the three cathedral towns, the cathedral organist at the chosen place conducting with his two colleagues assisting as pianist and organist. This practice was almost invariable, and is still maintained in a modified form, the conducting now being shared by visiting musicians of distinction. The festivals were discontinued during the World War, but resumed in 1920 with marked success. Other famous English festivals are the *Birmingham* (1768; discontinued since 1914); *Norwich* (1824 in its present Triennial form, but held at irregular intervals since 1770); *Leeds* (1858, but not regularly established until about 20 years later); the *Handel Commemoration* (1784 in Westminster Abbey and The Pantheon, subsequently at the Abbey alone, until 1791); and the *Handel Festival* (1857, and triennially from 1862, at the Crystal Palace, with a break during the War period).

In Germany an early event of the kind was the series of elaborate performances known as "Abendmusiken," which were started at the Marienkirche of Lübeck by Buxtehude in 1673. These consisted of choral and orchestral works, interspersed with organ solos. They were held on the five Sundays in Advent, in connection with the evening services, and soon became famous, visitors being attracted from remote parts. (Bach, when a young organist at Arnstadt, spent one of his holidays in walking to Lübeck—about 230 English miles—in order to attend). The "Abendmusiken" continued without break until well into the 19th century. Present-day German and Austrian Festivals include the *Lower-Rhine* (founded about 1824, held alternately at Cologne, Düsseldorf, and Aix-la-Chapelle; its origin was a Thuringian Festival held at Erfurt in 1811); the *Middle-Rhine* (Coblenz, Mayence, etc.); the *Tonkünstler-Societät* of Vienna (1772); and *Salzburg* (1917); but summer festivals, devoted mainly to Mozart's operas, had been held there for some years previously; the 1922 festival led to the founding of the International Society for Contemporary Music (*q.v.*), which has now (1928) about 20 branches in various countries. In addition, many festivals have long been held in commemoration of individual composers—*e.g.*, Bach at Eisenach and Leipzig; Beethoven at Bonn; Wagner at Bayreuth.

In America the earliest festivals were at Boston (1857) and Worcester (1858). In 1873 Theodore Thomas started the Cincinnati Festival (biennial). The Ann Arbor Festival (University of Michigan) has been held since 1893. Specially notable is the Bethlehem Bach Festival, held at Bethlehem, Pa., founded by Frederick Wolle in 1900, and conducted by him. (The sequence was broken in 1905–11.) From about 1900 dates the Norfolk, Conn., Festival; in 1910 that of Peterboro, N. H., came into being; and annually in early summer the North Shore Festival is held at Evanston, Ill. In 1917, Mrs. Coolidge began her munificent work on behalf of contemporary chamber music by founding the Berkshire Festival at Pittsfield, Mass., where the programmes are confined to chamber music, many important new works having been commissioned, or awarded prizes. The National Federation of Musical Clubs holds a biennial meeting and festival, and does much to promote smaller enterprises throughout the country.

Competition Festivals.—Of recent origin, but already one of the most important musical developments in the United Kingdom, is the Competition Festival movement. Originally it was confined to brass band contests. An account of one of these con-

tests, held in Yorkshire, appeared in *Household Words* during Dickens's editorship. The extension of the movement to other branches of executive music, especially choral, occurred in 1882, the *Stratford (Essex) Festival* was started by J. S. Curwen. The *Kendal Festival*, which owed its inception to Mary Wakefield, followed in 1885. The movement spread rapidly, and in 1927 about 200 organizations of the kind were affiliated to the British Federation of Musical Competition Festivals, which has its headquarters in London. The bulk of these meetings is held in England. Scotland has, however, a good number of flourishing festivals, and Ireland is becoming increasingly active in this respect. The movement has spread to remote parts of the British empire, 14 overseas festivals being attached to the Federation. Of these the largest are in Canada, and the remainder in Australia, New Zealand, South Africa and India. In addition there are held in Great Britain a considerable number of unaffiliated competitions; and Wales has numerous old established Eisteddfod (*q.v.*) wherein music plays a prominent part.

The scope of the Competition Festival has lately been extended very considerably, and most of the larger type include, not only sections for practically every branch of musical performance, but also classes in folk-dancing, elocution, composition (musical and literary), and dramatic art. An idea of the social and musical importance of the festivals may be gathered from a few statistics in connection with some of the larger meetings held in 1926, the figures being taken from the Federation Year Book for 1927: Bedfordshire, entries, 2,063, number of competitors, 10,486; Glasgow, 1,735—14,532; Blackpool, 1,650—8,000; Birmingham, 1,238—11,500. These festivals occupy from 7 to 14 days. That of Glasgow, for example, lasts a fortnight, with three sessions daily, classes sometimes being held simultaneously in three halls.

The importance of the small local festivals, however, must not be overlooked. Often their educational value is even greater than that of mammoth gatherings at which the proceedings are sometimes too congested to permit of this side being fully developed. The small rural festival usually affords ample opportunity for detailed adjudications, lectures and demonstrations, besides developing musical activities in places which would otherwise be more or less barren.

The movement has recently undergone some modifications, chiefly for good. Thus, money prizes and costly trophies are less in evidence, their places being taken by certificates. With this change of motive (from the tangible reward to the pleasure of making music for its own sake) has come an increasing tendency to focus the activity of a festival on to an important work for chorus and orchestra. A frequent plan is to choose a choral work, the whole of which is studied by entrants for some months. At the festival various numbers are used separately as test pieces in various classes (solo and choral), and the climax of the festival is reached with a performance of the complete work by all the competitors under the conductorship of one of the adjudicators. It is difficult to overestimate the value of this development, which gives some hundreds of musicians in a district a practical and intimate knowledge of masterpieces that otherwise they might never even hear.

It will be gathered that much depends on the standing and equipment of those who undertake the important work of judging. Happily the roll contains the names of a large proportion of the most prominent musicians in the country. It is no uncommon thing to find at a large festival as many as a dozen singers, instrumentalists, conductors and teachers, of more than national reputation, engaged in this important work.

Thus well established, both in regard to organization and musicianship, the Competition Festival has rapidly become one of the most potent factors in the social and artistic life of the country. (See also CHORAL SINGING.) (H. G.)

FESTOON, an ornament developed from the representation of a garland of leaves, fruit or flowers, cloth or ribbon, supported at two or more points and hanging in curves between. The festoon appears occasionally in late Greek work, particularly as a decoration for Hellenistic altars, but it was the Romans who gave it definite form. Roman festoons are usually made of fruit, grain,

leaves and flowers, treated with extreme naturalism, although in wall paintings and stucco decoration simpler and more conventional types are found. The festoon was a favourite motive of the early Italian Renaissance. In Baroque work through Europe many fantastic treatments of the cloth festoon exist.

FESTUS (? RUFUS or RUFUS), one of the Roman writers of *breviaria* (epitomes of Roman history). The fact that he refers to the defeat of the Goths at Noviodunum (A.D. 369) by Valens, but is unaware of the constitution of Valentia as a province (which took place in the same year) fixes the date of composition. Mommsen identifies the author with Rufius Festus, proconsul of Achaëa (366), and both with Rufius Festus Avienus (q.v.), the translator of Aratus. But the absence of the name Rufius in the best mss. is against this. Others take him to be Festus of Tridentum, *magister memoriae* (secretary) to Valens who, as proconsul of Asia, punished with merciless severity those implicated in the conspiracy of Theodorus. The work itself (*Breviarium rerum gestarum populi Romani*) is divided into two parts—one geographical, the other historical. The chief authorities used are Livy, Eutropius and Florus. It is extremely meagre, but the last part, which is based on the writer's personal recollections, is of some value for the history of the fourth century.

Editions by W. Förster (1873) and C. Wagener (1886); see also R. Jacobi, *De Festi brevium fontibus* (1874), and H. Peter, *Die geschichtliche Litt. über die römische Kaiserzeit* ii. p. 133 (1897), where the epitomes of Festus, Aurelius Victor and Eutropius are compared.

FESTUS, SEXTUS POMPEIUS, Roman grammarian, probably flourished in the 2nd century A.D. He made an epitome of the valuable work *De verborum significatione* (of which only fragments remain), by M. Verrius Flaccus, a freedman and grammarian who flourished in the reign of Augustus. Festus gives the etymology and meaning of every word; and throws light on the antiquities of Rome. He made a few alterations, and inserted some critical remarks of his own. Latin words which had long become obsolete were relegated to a separate work (*Priscorum verborum cum exemplis*), now lost. Festus's epitome exists in only one ms., the Codex Festi Farnesianus at Naples, which contains the second half of the work (M-V) only, and that not in a perfect condition. It has been published in facsimile by Thewrewk de Ponor (1890). At the close of the 8th century Paulus Diaconus abridged the abridgment. From his work and the solitary copy of the original attempts have been made to reconstruct the treatise of Festus.

Of the early editions the best are those of J. Scaliger (1565) and Fulvius Ursinus (1581); in modern times, those of C. O. Müller (1839, reprinted 1880) and de Ponor (1889), new edition by W. M. Lindsay (Leipzig, 1913). See J. E. Sandys, *History of Classical Scholarship*, vol. i. (1906); L. Havet, "Notes Critiques sur le Texte de F.," (*in Bib. de l'École des Hautes Études*, 1914; W. M. Lindsay, *Ancient Lore in Mediaeval Glossaries* (1921) for Festus as a source of the Abolita Glossary.

FET or **FOETH**, **AFANASI AFANASIEVICH** (1820–1892), who assumed by decree in 1876 the name of Shenshin, Russian poet, was born at Novoselki, Orel, on Dec. 5, 1820, the illegitimate son of a landowner named Shenshin. He was still a student at Moscow university when, in 1842, he published some admirable lyrics in the *Moskvityanin*. In 1850 a volume of his *Poems* appeared, followed by another in 1856. He then served for some years in the army, retiring with the grade of captain in 1856. In 1860 he settled on an estate at Stepanovka, where he was often visited by Turgenev and Tolstoi. Fet's sincere and passionate lyric poetry strongly influenced later Russian poets, but during his lifetime he was decried because of his reactionary political views, and somewhat unattractive personality. He published very little after 1863, but he continued to write nature poetry and love lyrics which were published in a collected edition (4 vols. 1894). Fet also made some fine translations from Horace, Catullus and Tibullus, of Goethe's *Faust* and *Hermann und Dorothea*. He died in Moscow on Dec. 3, 1892.

See a paper on Fet in Oliver Elton's *Sheaf of Papers* (1922) which

includes some translations.

FÊTE NATIONALE, an annual national holiday in France held on July 14 in commemoration of the fall of the Bastille. A second *fête nationale* is held on Sept. 22, commemorating the establishment of republican government.

FÉTIS, FRANÇOIS JOSEPH (1784–1871), Belgian composer and writer on music, was born in Mons on March 25, 1784, and died in Brussels on March 26, 1871. He was trained as a musician by his father, who followed the same calling. His talent for composition manifested itself at the age of seven, and at nine years old he was an organist at Sainte-Waudru. In 1800 he went to Paris and completed his studies at the conservatoire under Boieldieu, Rey and Pradher. In 1806 he undertook the revision of the Roman liturgical chants in the hope of discovering and establishing their original form. In this year he married the granddaughter of the Chevalier de Kéralio, and also began his *Biographie universelle des musiciens*, the most important of his works, which did not appear until 1834. In 1821 he was appointed professor of counterpoint and fugue at the Paris conservatoire. In 1827 he founded the *Revue musicale*, the first serious paper in France devoted exclusively to musical matters. In 1833, at the request of Leopold I., he became director of the conservatoire of Brussels and the king's *maître de chapelle*. Fétis was a prolific composer, but his real service to music lies not in his compositions but in his historical and theoretical work. The *Biographie universelle* is not without errors, but many of these were corrected in the 2nd ed. (Paris 1860–65), and the work is still one of great value. It was completed by Pougin (2 vols. 1878–80). His other works included: *Histoire générale de la musique* (5 vols. 1869–76), in which he comes down to the 15th century; *La Musique mise à la portée de tout le monde* (Paris, 1830); *Traité de l'accompagnement de la partition* (1829); *Traité complet de la théorie et de la pratique de l'harmonie* (1844); and the important, indeed classical, *Traité du contrepoint et de la fugue* (1824).

See L. Alvin, *Notice sur J. J. Fétis* (1874).

FETISHISM, an ill-defined term, used in many different senses: (a) the worship of inanimate objects, often regarded as peculiarly African; (b) negro religion in general; (c) the worship of inanimate objects conceived as the residence of spirits not inseparably bound up with, nor originally connected with such objects; (d) the doctrine of spirits embodied in, or attached to, or conveying influence through, certain material objects (Tylor); (e) the use of charms, which are not worshipped, but derive their magical power from a god or spirit; (f) the use as charms of objects regarded as magically potent in themselves; (g) as synonymous with the religions of primitive peoples, including under it not only the worship of inanimate objects, such as the sun, moon or stars, but even such phases of primitive philosophy as totemism. Comte applied the term to denominate the view of nature more commonly termed animism.

Derivation.—The word fetish (or fetich) was first used in connection with Africa by the Portuguese discoverers of the last half of the 15th century; relics of saints, rosaries and images were then abundant all over Europe and were regarded as possessing magical virtue; they were termed by the Portuguese *Feiticos* (i.e., charms). Early voyagers to West Africa applied this term to the wooden figures, stones, etc., regarded as the temporary residence of gods or spirits, and to charms. There is no reason to suppose that the word *feitico* was applied either to an animal or to the local spirit of a river, hill or forest. *Feitico* is sometimes interpreted to mean artificial, made by man, but the original sense is more probably "magically active or artful." The word was probably brought into general use by C. de Brosses, author of *Du culte des dieux fétiches* (1760), but it is frequently used by W. Bosman in his *Description of Guinea* (1705), in the sense of "the false god, Bossum" or "Bohsum," properly a tutelary deity of an individual.

Definition.—The term fetish is commonly understood to mean the worship of or respect for material, inanimate objects, conceived as magically active from a virtue inherent in them temporarily or permanently, which does not arise from the fact that a god or spirit is believed to reside in them or communicate virtue to

them. After a certain grade of culture has been attained the belief in luck appears; the fetish is essentially a mascot or object carried for luck.

Ordinary Usage.—In the sense in which Dr. Tylor uses the term the fetish is (1) a "god-house" or (2) a charm derived from a tutelary deity or spirit, and magically active in virtue of its association with such deity or spirit. In the first of these senses the word is applied to objects ranging from the unworked stone to the pot or the wooden figure, and is thus hardly distinguishable from idolatry. (a) The *bohsum* or tutelary deity of a particular section of the community is derived from the local gods through the priests by the performance of a certain series of rites. A *bohsum* may also be procured through a dream, but in this case, too, it is necessary to apply to the priest to decide whether the dream was veridical. (b) The *suman* is "an object which is the potential dwelling-place of a spirit or spirits of an inferior status, generally belonging to the vegetable kingdom: this object is closely associated with the control of the powers of evil or black magic, for personal ends, but not necessarily to assist the owner to work evil, since it is used as much for defensive as for offensive purposes."

On the Guinea coast the spirit in the object is usually, if not invariably, non-human. Farther south on the Congo the "fetish" is inhabited by human souls also. The priest goes into the forest and cuts an image; when a party enters a wood for this purpose they may not mention the name of any living being unless they wish him to die and his soul to enter the fetish. The right person having been selected, his name is mentioned; and he is believed to die within ten days, his soul passing into the *nkissi*. Nails are driven into these figures in order to procure the vengeance of the indwelling spirit on some enemy.

African religion is not fetishism: it rests on animism and the belief in higher gods, not necessarily accompanied with worship or propitiation, which there is no reason to suppose has been derived in every case, even in any case, from Christian or Mohammedan missionaries.

FETTERCAIRN, burgh of barony and parish, Kincardineshire, Scotland, $4\frac{1}{2}$ m. N.W. of Laurencekirk. Pop. of parish (1931) 1,087. The market cross originally belonged to the extinct town of Kincardine. There is a large distillery near the town. Balbegno Castle, dating from 1509, contains a lofty hall of fine proportions. Ruins are seen of the royal castle of Kincardine, where, according to tradition, Kenneth III. was assassinated in 1005, although he is more generally said to have been slain in battle at Monzievaird, near Crieff in Perthshire.

FETTERS AND HANDCUFFS, instruments for securing the feet and hands of prisoners under arrest, or as a means of punishment. The old names were manacles, shackbolts or shackles, gyves and swivels. Until within recent times handcuffs were of two kinds, the figure-8 ones which confined the hands close together either in front or behind the prisoner, or the rings from the wrists were connected by a short chain much on the model of the handcuffs in use by the police forces of to-day. For the removal of gangs of convicts an arrangement of handcuffs connected by a light chain is used, the chain running through a ring on each fetter and made fast at both ends by what are known as *end-locks*. Several recently invented appliances are used as handcuffs, e.g., snaps, nippers, twisters. They differ from handcuffs in being intended for one wrist only, the other portion being held by the captor. In the snap the smaller circlet is snapped to on the prisoner's wrist. The nippers can be instantly fastened on the wrist. The twister, not now used in England as being liable to injure prisoners seriously, is a chain attached to two handles; the chain is put round the wrist and the two handles twisted till

the chain is tight enough.

Leg-irons are anklets of steel connected by light chains long enough to permit of the wearer walking with short steps. An obsolete form was an anklet and chain to the end of which was attached a heavy weight, usually a round shot. The Spanish used to secure prisoners in bilboes, shackles round the ankles secured by a long bar of iron. This form of leg-iron was adopted in England, and was much employed in the services during the 17th and 18th centuries. An ancient example is preserved in the Tower of London.

FEU, in Scotland, the common mode of land tenure. The word is the Scots variant of "fee" (*q.v.*). The feudal system still dominates Scots conveyancing, but its forms are now extensively modified by the Titles to Land (Consolidation) (Scotland) Act 1868, the Conveyancing (Scotland) Act 1874, the Conveyancing (Scotland) Act 1924, and some other statutes. It now contains three variants of holding. Burgage holding is the system by which land in royal burghs is held. Blench holding is by a nominal payment, as of a penny Scots to be rendered upon demand only. In feu holding proper there is a substantial annual payment in money in return for the enjoyment of the land. The Crown is the first overlord or superior, and land is held of it by Crown vassals, but they in their turn may "feu" their land, as it is called, to others who become *their* vassals, whilst they themselves become mediate overlords or superiors. This process of sub-infeudation may be repeated to an indefinite extent, except in cases where sub-infeudation has been conventionally prohibited prior to 1874. If the vassal does not pay the annual feu-duty for two years, the superior, among other remedies, may obtain by legal process a decree of irritancy, whereupon *tinsel* or forfeiture of the feu follows. Casualties, which are a feature of land held in feu, are additional payments to the superior, contingent on the happening of certain events. By the Feudal Casualties (Scotland) Act 1914 all such casualties as may not have been redeemed or commuted by Jan. 1, 1930, shall be extinguished and discharged.

See Erskine's *Principles*; Bell's *Principles*; Rankine, *Law of Landownership in Scotland*.

FEUCHÈRES, SOPHIE, BARONNE DE (1795–1840), Anglo-French adventuress, was born at St. Helens, Isle of Wight, in 1795, the daughter of a drunken fisherman named Dawes. She grew up in the workhouse, went up to London as a servant, and became the mistress of the duc de Bourbon, afterwards prince de Condé, who gave her a good education in modern and ancient languages. He arranged her marriage to Adrien Victor de Feuchères, and the baroness, pretty and clever, became a person of consequence at the court of Louis XVIII. De Feuchères discovered the relations between his wife and Condé, whom he had been assured was her father, obtained a legal separation in 1827, and the king forbade her appearance at court. Thanks to her influence, however, Condé was induced in 1829 to sign a will bequeathing more than sixty-six million francs to the duc d'Aumale, fourth son of Louis Philippe. Again she was in high favour. Charles X. received her at court, Talleyrand visited her, her niece married a marquis and her nephew was made a baron. Condé, wearied by his mistress's importunities, and but half pleased by the advances made him by the government of July, had made up his mind to leave France secretly. However, he was found hanging dead from his window (Aug. 27, 1830). The baroness returned to London, where she died in Dec. 1840.

FEUCHTERSLEBEN, ERNST, FREIHERR VON (1806–1849), Austrian physician, poet and philosopher, was born in Vienna on April 29, 1806, of an old Saxon noble family. He was educated at the University of Vienna, and in 1844 was appointed dean of the faculty of medicine. In 1848, while refusing the presidency of the ministry of education, he accepted the appointment of under secretary of state in that department. He died in Vienna on Sept. 3, 1849. He was not only a clever physician, but a poet of fine aesthetical taste and a philosopher. Among his medical works may be mentioned: *Über das Hippokratische erste Buch von der Diät* (Vienna, 1835), *Ärzte und Publicum* (Vienna, 1848) and *Lehrbuch der ärztlichen Seelenkunde* (1845). His poetical works include *Gedichte* (Stutt., 1836), among which is the

well-known beautiful hymn, which Mendelssohn set to music, "Es ist bestimmt in Gottes Rat." As a philosopher he is best known by his *zur Diätetik der Seele* [Dietetics of the Soul] (Vienna, 1838). Noteworthy also is his *Beiträge zur Literatur-Kunst und Lebenstheorie* (Vienna, 1837-41), and an anthology, *Geist der deutschen Klassiker* (Vienna, 1851).

His collected works (with the exception of the purely medical ones) were published in 7 vols. by Fr. Hebbel (1851-53). See M. Necker, "Ernst von Feuchtersleben, der Freund Grillparzers," in the *Jahrbuch der Grillparzer Gesellschaft*, vol. iii. (1893).

FEUCHTWANGER, LION (1884-), German writer, was born in Munich on July 7, 1884, of a Jewish family, his father being a manufacturer. He studied philosophy in Berlin and Munich but early devoted himself to literature. His first works were dramatic pieces, original or translations; *Die Perser* (Aeschylus) (1915); *Vasantasena* (1915); *Friede* (Aristophanes) (1916); *Kriegsgefangenen* (1916); *Thomas Wendt* (dramatic novel, 1919); *Der holländische Kaufmann* (1921). He broke new ground in 1923 with a remarkable historical novel of Margarete Maultasch, duchess of Tirol (*Die hässliche Herzogin*; English trans. *The Ugly Duchess* 1927) in which the life of 14th century Tirol was reproduced with great dramatic force and erudite accuracy. *Jud Süß* (1925, English trans. *Jew Süß* 1927) a novel of 18th century Germany was more remarkable still. The background was extraordinarily rich, the central figure drawn with great power, the story most moving. Feuchtwanger's later works include *Angelsächsische Trilogie* (1927); *Eduard II.* drama (1925); *Wetcheeks amerikanisches Liederbuch* (1927), poems.

FEUD, animosity, hatred, especially a permanent condition of hostilities between persons, and hence applied to a state of private warfare between tribes, clans or families, a "vendetta." For the etymology of "feud" (*feudum*) see **FEE**, and for its history see **FEUDALISM**.

FEUDALISM (from Late Lat. *feodum* or *feudum*, a fee or fief; see **FEE**). In every case of institutional growth in history two things are to be distinguished from the beginning for an understanding of the process and its results. One of these is the change of conditions in the political or social environment which made growth necessary. The other is the already existing institutions which began to be transformed to meet the new needs. In studying the origin and growth of political feudalism, the distinction is easy to make. The prevailing need of the later Roman and early mediaeval society was protection—protection against the sudden attacks of invaders or revolted peasants, against the unwarranted demands of government officers, or even against the legal but too heavy exactions of the government. The protection which the government normally furnished, the weak freeman and the small landowner could no longer obtain. He must seek protection wherever he could get it, and pay the price demanded for it. These are the great social facts—the failure of government to perform one of its most primary duties, the necessity of finding some substitute in private life—extending through the whole formative period of feudalism.

Roman Origins.—The institutions which the need of protection seized upon had both long existed in the private, not public, relations of the Romans. One of them related to the person, the other related to land. There are thus distinguished at the beginning those two great sides of feudalism which remained to the end more or less distinct. The personal institution needs little description. It was the Roman patron and client relationship which had remained in the days of the empire, in later times less important perhaps legally than socially. This institution, the *patrocinium*, was firmly enough entrenched to survive the German conquest, and to be continued by the conquerors. In its new use, alike in the later Roman and the early German state, the landless freeman who could not support himself offered his services, those proper to a freeman, to some powerful man in return for shelter and support. This transaction, called commendation, gave rise in the German state to a written contract which related the facts and provided a penalty for its violation. It created a relationship of protection and support on one side, and of free service on the other.

The other institution, relating to land, was that known to the Roman law as the *precarius*, because of the prayer of the suppliant by which the relationship was begun. The *precarius* was a form of renting land not intended primarily for income, but for use when the lease was made from friendship, for example, or as a reward, or to secure a debt. Legally its characteristic feature was that the lessee had no right of any kind against the grantor. The owner could terminate the relation at any time, for any reason, or for none at all, and the heirs of neither party were bound by it.¹ The legal character of this transaction is summed up in a well-known passage in the *Digest* (xliii. 26. 12) which may be paraphrased as follows:—The *precarius* tenant may employ the interdict against a third party, because he cannot use the ordinary civil action, his holding being not a matter of business but rather of favour and kindness.

As used for protection in later Roman days the *precarius* gave rise to what was called the commendation of lands, *patrocinium fundorum*. The poor landowner surrendered to his powerful neighbour the ownership of his lands, which he then received back as a *precarius*—gaining protection during his lifetime at the cost of his children, who were left without legal claim and compelled to make the best terms they could.² Applied to this use the *precarius* found extensive employment in the last age of the empire. The government looked on the practice with disfavour, because it transferred large areas from the easy access of the state to an ownership beyond its reach. The laws repeatedly forbade it under increasing penalties, but it could not be stopped.

Frankish Development.—These practices the Frankish conquerors of Gaul found in full possession of society, and they seem to have made them their own without material change. The *patrocinium* they could understand by the existence of a somewhat similar institution among themselves, the *comitatus*, described by Tacitus. The *comitatus* made contributions of its own to future feudalism, to some extent to its institutional side, largely to the ideas and spirit which ruled in it. Probably the ceremony which grew into feudal homage, and the oath of fealty, certainly the honourable position of the vassal and his pride in the relationship, the strong tie which bound lord and man, and the idea that faith and service were due on both sides in equal measure, may be traced to German sources. But we must not forget that the origin of the vassal relationship, as an institution, is to be found on Roman soil.

To the *precarius* German institutions offered no close parallel. The advantages which it afforded were obvious, and this side of feudalism developed as rapidly after the conquest as the personal. The new German noble was as eager to extend his lands and to increase the numbers of his dependants as the Romans had been. The new German government furnished no better protection from local violence, nor was it able any more effectively to check the practices which were creating feudalism. *Precarius* and *patrocinium* easily passed from the Roman empire to the Frankish kingdom, and became firmly rooted in the new society. Up to this point we have seen only the small landowner and the landless man entering into these relations. Feudalism could not be established, however, until the great of the land had begun to enter the clientage of others and to hold lands by the *precarius* tenure. The first step was quickly taken. The same class continued to furnish the king's men, and to form his household and body-guard whether the relation was that of the *patrocinium* or the *comitatus*, and to be made noble by entering into it. It was later that they became clients of one another, and in part at least as a result of their adoption of the *precarius* tenure. In this latter step the influence of the Church rather than of the king seems to have been effective. The large estates which pious intentions had bestowed on the Church it was not allowed to alienate. It could most easily make them useful by employing the *precarius* tenure. On the other side, the great men were ready without persuasion to annex portions of these estates for their own on the easy terms of this tenure, not always indeed observed by the holder, or able to be enforced by the Church. The employment of the

¹*Digest*, xliii. 26. 14, and cf. 17.

²Salvian, *De gub. Dei*, v. 8, ed. Halm, p. 62.

precarium by the Church seems to have been one of the surest means by which this form of landholding was carried over from the Romans to the Frankish period and developed into new forms. It came to be made by degrees the subject of written contract, by which the rights of the holder were more definitely defined and protected than had been the case in Roman law. The length of time for which the holding should last came to be specified, at first for a term of years and then for life, and some payment to the grantor was provided for, not pretending to represent the economic value of the land, but only to serve as a mark of his continued ownership.

The Carolingian Age.—These changes characterize the Merovingian age, which had practically ended, however, before these two institutions showed any tendency to join. Nor had the king up to that time exerted any apparent influence on the processes that were going forward. It was the advent of the Carolingian princes that carried these institutions a stage further forward. Making their way up from a position among the nobility to be the rulers of the land, and finally to supplant the kings, the Carolingians had especial need of resources from which to purchase and reward faithful support. The fundamental principle of the Frankish military system, that the man served at his own expense, was still unchanged. It had indeed begun to break down under the strain of frequent and distant campaigns, but it was long before it was changed as the recognized rule of mediaeval service. If now, in addition to his own expenses, the soldier must provide a horse and its keeping, the system was likely to break down. To solve this problem the early Carolingian princes, especially Charles Martel, grasped at the land of the Church. The means devised to permit its use were found in the *precarium* tenure. Keeping alive, as it did, the fact of the grantor's ownership, it did not in form deprive the Church of the land. Recognizing that ownership by a small payment not corresponding to the value of the land, it left the larger part of the income to meet the need which had arisen. At the same time undoubtedly the new holder of the land, if not already the vassal of the prince, was obliged to assume an obligation of service with a mounted force when called upon. This expedient gave rise to the numerous *precariae verbo regis*, of the Church records, and to the condemnation of Charles Martel in the visions of the clergy to worse difficulties in the future life than he had overcome in this. The most important consequences of the expedient, however, was the bringing together of the two sides of feudalism, vassalage and benefice, as they were now commonly called. It emphasized military service as an essential obligation of the vassal; and it spread the vassal relation between individual proprietors and the sovereign.

During the reign of Charlemagne and the later Carolingian age continued necessities, military and civil, forced the kings to recognize these new institutions more fully, even when standing between the government and the subject, intercepting the public duties of the latter. The incipient feudal baron had not been slow to take advantage of the break-down of the old German military system. The poor Frank could escape the ruinous demands of military service only by submitting himself and his lands to the count, who did not hesitate on his side to force such submission. Charlemagne legislated against this tendency, trying to make it easier for the poor freeman to fulfil his military duties directly to the state, and to forbid the misuse of power by the rich. Finally the king was compelled to recognize existing facts, to lay upon the lord the duty of producing his men in the field and to allow him to appear as their commander. This completed the transformation of the army into a vassal army; it completed the recognition of feudalism by the state, as a legitimate relation between different ranks of the people; and it recognized the transformation in a great number of cases of a public duty into a private obligation.

In the meantime another institution had grown up in this Franco-Roman society, which probably began and certainly assisted in another transformation of the same kind. This is the immunity. Suggested probably by Roman practices, it received a great extension in the Merovingian period, at first and especially

in the interest of the Church, but soon of lay land-holders. By the grant of an immunity to a proprietor the royal officers, the count and his representatives, were forbidden to enter his lands to exercise any public function there. The duties which the count should perform passed to the proprietor, who now represented the government for all his tenants free and unfree. Apparently no modification of the royal rights was intended by this arrangement, but the beginning of a great change had really been made. The king might still receive the same revenues and the same services from the district held by the lord as formerly, but for their payment a private person in his capacity as overlord was now responsible. In the course of a long period characterized by a weak central government, it was not difficult to enlarge the rights which the lord thus obtained, to exclude even the king's personal authority from the immunity, and to translate the duties and payments which the tenant had once owed to the state into obligations which he owed to his lord, even finally into incidents of his tenure. The most important public function whose transformation into a private possession was assisted by the growth of the immunity was the judicial. The lord's court gradually took the place of the public court in civil, and even by degrees in criminal cases. The plaintiff, even if he were under another lord, was obliged to sue in the court of the defendant's lord, and the portion of the fine for a breach of the peace which should have gone to the state went in the end to the lord.

The transfer of the judicial process, and of the financial and administrative sides of the government as well, into private possession, was not, however, accomplished entirely by the road of the immunity. As government weakened after the strong days of Charlemagne, and disorder, invasion, and the difficulty of intercommunication tended to throw the locality more and more upon its own resources, the officer who had once been the means of centralization, the count, was able to exercise the powers which had been committed to him as an agent of the king, as if they were his own private possession. Nor was the king's aid lacking to this method of dividing up the royal authority, any more than to the immunity, for it became a frequent practice to make the administrative office into a fief, and to grant it to be held in that form of property by the count. In this way the feudal county, or duchy, formed itself, corresponding in most cases only roughly to the old administrative divisions of the state.

DIFFERENT STAGES OF GROWTH

In its earliest stage of growth the feudal system was that of the private possession only. For protection the great landowner forced his smaller neighbours to become his dependants in return under a great variety of forms, but especially developing thereby the *precarium* land tenure and the *patrocinium* personal service, and organizing a private jurisdiction over his tenants, and a private army for defence. Finally he secured from the king an immunity which excluded the royal officers from his lands and made him a quasi-representative of the state. In the meantime his neighbour the count had been following a similar process. His right to exact military, financial and judicial duties for the state he had used to force men to become his dependants, and then he had stood between them and the state, freeing them from burdens which he threw with increased weight upon those who still stood outside his personal protection. The kings first adopted for themselves some of the forms and practices which had thus grown up, and by degrees recognized them as legally proper for all classes. It proved to be easier to hold the lord responsible for the public duties of all his dependants because he was the king's vassal and by attaching them as conditions to the benefices which he held, than to enforce them directly upon every subject. When this stage was reached the formative age of feudalism may be considered at an end. When the government of the state had entered into feudalism, and the king was as much lord as king; when the vassal relationship was recognized as a proper and legal foundation of public duties; when the two separate sides of early feudalism were united as the almost universal rule, so that a man received a fief because he owed a vassal's duties, or looked at in the other and finally prevailing way, that he owed a vassal's

duties because he had received a fief; and finally, when the old idea of the temporary character of the *precarium* tenure was lost sight of, and the right of the vassal's heir to receive his father's holding was recognized as the general rule—then the feudal system may be called full grown. We shall not be far wrong if we place the end of its formative age near the beginning of the 10th century.

Results in England.—The growth which we have traced took place within the Frankish Empire. In Anglo-Saxon England *precarium* and *patrocinium* were lacking. Certain forms of personal commendation did develop, certain forms of dependent land tenure came into use, but these were not characteristic of the actual line of feudal descent. Scholars are not yet agreed as to what would have been their result if their natural development had not been cut off by the violent introduction of Frankish feudalism with the Norman conquest, whether the historical feudal system, or a feudal system in the general sense. To the writer it seems clear that the latter is the most that can be asserted. They were forms which may rightly be called feudal, but only in the wider meaning in which we speak of the feudalism of Japan, or of Central Africa, not in the sense of 12th-century European feudalism; Saxon commendation may rightly be called vassalage, but only as looking back to the early Frankish use of the term for many varying forms of practice, not as looking forward to the later and more definite usage of completed feudalism; and such use of the terms feudal and vassalage is sure to be misleading. There is no trace of the distinctive marks of Frankish feudalism in Saxon England, not where military service may be thought to rest upon the land, nor even in the rare cases where the tenant seems to some to be made responsible for it, for between these cases as they are described in the original accounts, legally interpreted, and the feudal conception of the vassal's military service, there is a great gulf.

The Completed System.—The temptation to use the larger part of any space allotted to the history of feudalism for a discussion of origins does not arise alone from greater interest in that phase of the subject. It is almost impossible even with the most discriminating care to give a brief account of completed feudalism and convey no wrong impression. We use the term "feudal system" for convenience sake, but with a degree of impropriety if it conveys the meaning "systematic." Feudalism in its most flourishing age was anything but systematic. Great diversity prevailed everywhere, and different facts or customs are found in every lordship. But underlying all the apparent confusion of fact and practice were certain fundamental principles and relationships, which were alike everywhere. The chief of these are: the relation of vassal and lord; the principle that every holder of land is a tenant and not an owner, until the highest rank is reached, sometimes even the conception rules in that rank; that the tenure by which a thing of value is held is one of honourable service, not intended to be economic, but moral and political in character; the principle of mutual obligations of loyalty, protection and service binding together all the ranks of this society from the highest to the lowest; and the principle of contract between lord and tenant, as determining all rights, controlling their modification, and forming the foundation of all law.

The foundation of the feudal relationship proper was the fief, which was usually land, but might be any desirable thing, as an office, a revenue in money or kind, the right to collect a toll, or operate a mill. In return for the fief, the man became the vassal of his lord; he knelt before him, and, with his hands between his lord's hands, promised him fealty and service; he rose to his feet and took the oath of fealty which bound him to the obligations he had assumed in homage; he received from his lord ceremonial investiture with the fief. The faithful performance of all the duties he had assumed in homage constituted the vassal's right and title to his fief. So long as they were fulfilled, he, and his heir after him, held the fief as his property, practically and in relation to all under tenants as if he were the owner. In the ceremony of homage and investiture, which is the creative contract of feudalism, the obligations assumed by the two parties were determined, as a rule, by local custom. In detail the vassal's services differed widely, but they fall into two classes, general and specific. The

general included all that might come under the idea of loyalty, seeking the lord's interests, keeping his secrets, betraying the plans of his enemies, protecting his family, etc. The specific services covered military service, which included appearance in the field on summons with a certain force, often armed in a specified way, and remaining a specified time. It often covered also the duty of guarding the lord's castle, and of holding one's own castle subject to the plans of the lord for the defence of his fief. Hardly less characteristic was court service, which included the duty of helping to form the court on summons, of taking one's own cases to that court instead of to some other, and of submitting to its judgments. The duty of giving the lord advice was often fulfilled in sessions of the court, and in these feudal courts the obligations of lord and vassal were enforced, with an ultimate appeal to war. Under this head may be enumerated the financial duties of the vassal, which were either intended to mark the vassal's tenant relation, like the relief, or to be a part of his service, like the aid, that is, he was held to come to the aid of his lord in a case of financial as of military necessity. The relief was a sum paid by the heir for the lord's recognition of his succession. The aids were paid on a few occasions, determined by custom, where the lord was put to unusual expense, as for his ransom when captured by the enemy, or for the knighting of his eldest son. The most lucrative of the lord's rights were wardship and marriage.

Ideally regarded, feudalism covered Europe with a network of these fiefs, rising gradually from the smallest, the knight's fee, at the bottom, to the king at the top, who was the supreme landowner, or who held the kingdom from God. Actually not even in the most regular of feudal countries, like England or Germany, was there any fixed gradation. A knight might hold directly of the king, a count of a viscount, a bishop of an abbot, or the king himself of one of his own vassals, or even of a vassal's vassal, and in return his vassal's vassal might hold another fief directly of him.

The Government of Feudal Countries.—It is now possible perhaps to get some idea of the way in which the government of a feudal country was operated. The early German governments whose chief functions, military, judicial, financial, legislative, were carried on by the freemen of the nation, and were performed as duties owed to the community for its defence and sustenance, had given way to new forms of organization in which these conceptions had not entirely disappeared, but in which the vast majority of cases a wholly different idea of the ground of service and obligation prevailed. The members of the feudal court met, not to fulfil a duty owed to the community, but a private obligation which they had assumed in return for the fiefs. The feudal state was one in which, as it has been said, private law had usurped the place of public law. Public duty had become private obligation. To understand the feudal state it is essential to realize that all sorts of services, which men ordinarily owe to the public or to one another, were translated into a form of rent paid for the use of land, and defined and enforced by a private contract. In every feudal country, however, something of the earlier conception survived. A general military levy was occasionally made. Something like taxation occasionally occurred, though the government was usually sustained by the scanty feudal payments, by the proceeds of justice and by the income of domain manors. About the office of king more of this earlier conception gathered than elsewhere in the state, and gradually grew, aided not merely by traditional ideas, but by the active influence of the Bible, and soon of the Roman law. The kingship formed the nucleus of new governments as the feudal system passed away.

Actual government in the feudal age was primitive and undifferentiated. Its chief and almost only organ, for kingdom and barony alike, was the *curia*—a court formed of the vassals. This acted at once and without any consciousness of difference of function, as judiciary, as legislature, and as council, and it exercised final supervision and control over revenue and administration. Almost all the institutions of modern states go back to the *curia regis*, branching off from it as the growing complexity of business forced differentiation of function and personnel. In action it was an assembly court, deciding all questions by discussion and the weight of opinion, though its decisions obtained their legal

validity by the formal pronunciation of the presiding member, i.e., of the lord whose court it was. In a government of this kind the essential operative element was the baron. So long as the government remained dependent on the baron, it remained feudal in its character. Feudalism disappeared as the organization of society, when a professional class arose to form the judiciary, when the increased circulation of money made regular taxation possible and enabled the government to buy military and other services, and when better means of intercommunication and the growth of common ideas made a wide centralization possible and likely to be permanent. In nearly all the states of Europe the end of the feudal age was reached about the close of the 13th century.

Decline and Survivals.—As feudalism passed into decline, its customs tended to crystallize into fixed forms. At the same time a class of men arose interested in these forms for their own sake, professional lawyers or judges, who wrote down for their own and others' use the feudal usages with which they were familiar. The great age of these codes was especially the second half of the 13th century. The codes in their turn tended still further to harden these usages into fixed forms, and we may date from the end of the 13th century an age of feudal law regulating especially the holding and transfer of land, and much more uniform in character than the law of the feudal age proper. This was particularly the case in parts of France and Germany where feudalism continued to regulate the property relations of lords and vassals longer than elsewhere, and where the underlying economic feudalism remained in large part unchanged.

Feudalism formed the starting-point also of the later social nobilities of Europe. They drew from it their titles and ranks and many of their regulative ideas, though these were formed into more definite and regular systems than ever existed in feudalism proper. It was often the policy of kings to increase the social privileges and legal exemptions of the nobility while taking away all political power, so that it is necessary in the history of institutions to distinguish sharply between these nobilities and the feudal baronage proper. It is only in certain backward parts of Europe that the terms feudal and baronage in any technical sense can be used of the nobility of the 15th century.

FEU DE JOIE. French, meaning literally a bonfire, or fire of joy. A discharge of musketry into the air, with blank ammunition, made in honour of some great occasion and usually forming part of a salute.

It is carried out by men firing in rapid succession along a line or lines of riflemen. It has a great spectacular effect when carried out by large numbers of troops.

FEUERBACH, ANSELM (1829-1880), German painter, born in Speyer on Sept. 12, 1829, son of J. A. Feuerbach, professor of philology and archaeology. Equipped with a superior education and good family traditions, he went to Düsseldorf in 1845 to study art under W. Schadow. In Munich, where he studied in 1848, he came under the influence of Karl Rahls. He then proceeded to Antwerp; and in 1851 to Paris, where he worked under Thomas Couture. He was thus the first of a line of German painters, who, dissatisfied with the somewhat theoretic artistic traditions in their native country, sought inspiration in French art. Having obtained a prize to go to Italy in 1855, he copied, in Venice, the "Assumption" by Titian for the court at Carlsruhe. He then went to Florence and to Rome, where he stayed till 1873. The impressions of Italy strengthened and perfected his classicist training. He aimed henceforth at a revival of antique classical ideals, considering them as the absolute standard of beauty; and he became the greatest representative of classicism in Germany. His first works of importance, painted while in Paris, the "Hafiz at the Well" (1852) and the "Death of Aretino" (1854) showed that he had assimilated the traditions of French classicism as taught by Ingres' pupil, Couture. Venetian influences can be traced in the warm and glowing colour and in the treatment of "Dante Walking with the Noble Ladies of Ravenna" (1857) and of "Dante's Death" (1858). Then came his Roman period. The "Pietà" (1863), the two pictures representing "Iphigenia" (1862 and 1871) and "Plato's Symposium" (1873) are cool and grey in tone, defined and plastic in form with a clear outline. They reveal the artist at the height of his classicist achievement. The composition of the "Symposium" is like an antique relief. Other notable works are the "Medea," the "Judgment of Paris," and the "Battle of the Amazons" (1869). He was now at the height of his reputation and counted Graf von Schack and the king of Bavaria among his patrons. In 1873 he accepted an invitation to teach at the Vienna academy and to decorate a ceiling in that academy with a series of compositions representing the "Wars of the Titans." This work was never completed. The artistic atmosphere of Vienna, where Makart with his luxurious colour dominated, was not congenial to Feuerbach's intellectual art. His work met with little appreciation and his sensitive nature was wounded by unfavourable criticism. His health gave way, and he resigned his post. Hoping to regain his strength he went to Italy and died in a hotel at Venice on Jan. 4, 1880. Posterity has made amends for the want of appreciation. His works are now exhibited in the leading galleries of Germany; but though his ambition had been to be Germany's greatest monumental painter, his strongest appeal to modern art-lovers lies in his portraits, his landscapes and his single figures; for here his fine conception and depth of feeling is not effaced by vain strivings in imitation of classic masters. The dignified portrait of his stepmother and that of "Nanna Risi," his beautiful Roman model, who figured in many of his large compositions, are among his finest works, and so are his drawings. The story of the artist's struggles is told in the *Vermächtnis* written during his illness in Vienna and published in 1882. It belongs to the finest things in German literature, and contributed much to a revival of his fame. His letters to his stepmother, who was his greatest friend, were published in two volumes in 1911.

FEUERBACH, LUDWIG ANDREAS (1804-1872), German philosopher, fourth son of the eminent jurist (see below), was born at Landshut, Bavaria, on July 28, 1804. After two years in Berlin, under Hegel, Feuerbach studied natural science at Erlangen in 1828. His first book, published anonymously, *Gedanken über Tod und Unsterblichkeit* (1830), attacks personal

immortality and advocates the Spinozistic immortality of reabsorption in nature. He then published *Geschichte der neueren Philosophie* (2 vols., 1833–37), *Abälard und Heloise* (1834), *Pierre Bayle* (1838) and *Philosophie und Christentum* (1839) in which he claimed "that Christianity has in fact long vanished not only from the reason but from the life of mankind, that it is nothing more than a fixed idea." This attack is followed up in his most important work, *Das Wesen des Christentums* (1841 Eng. trs. by George Eliot, 1853) which aims to humanize theology. He lays it down that man is to himself his own object of thought. Religion is consciousness of the infinite. Religion therefore is "nothing else than the consciousness of the infinity of the consciousness; or, in the consciousness of the infinite, the conscious subject has for his object the infinity of his own nature." Thus God is, so to speak, the outward projection of man's inward nature. In pt. i he develops the "true or anthropological essence of religion." Treating of God in his various aspects "as a being of the understanding," "as a moral being or law," "as love" and so on, Feuerbach shows that these aspects correspond to some need of human nature. In pt. ii. he discusses the "false or theological essence of religion," i.e. the view which regards God as having a separate existence leads to a belief in revelation and in sacraments, which are pieces of religious materialism. Feuerbach denied that he was rightly called an atheist, but the denial is merely verbal. Like Fichte, he strives in vain to reconcile the religious consciousness with subjectivism. During the troubles of 1848–49 Feuerbach's attack upon orthodoxy made him something of a hero with the revolutionary party. His *Theogonie* (1857) was followed by *Gottheit, Freiheit und Unsterblichkeit* (1866). He died on Sept. 13, 1872.

Feuerbach's influence has been greatest upon the anti-Christian theologians such as D. F. Strauss, author of the *Leben Jesu*, and Bruno Bauer, who like Feuerbach had passed from Hegelianism to a form of naturalism. Some of his ideas were taken up by those engaged in the struggle between church and state in Germany, and those who, like F. Engels and Karl Marx, were leaders in the revolt of labour against capital. His work was too deliberately unsystematic ever to make him a power in philosophy.

His works appeared in 10 vols. (Leipzig, 1846–66; at Stuttgart 1903–11); his correspondence has been edited by K. Grün (1874). See A. Lévy, *La Philosophie de Feuerbach* (1904); M. Meyer, *L. Feuerbachs Moralphilosophie* (Berlin, 1899); E. v. Hartmann, *Geschichte d. Metaphysik* (Leipzig, 1899); F. Engels, *L. Feuerbach und d. Ausgang d. class. deutsch. Philos.* (2nd ed., 1895); A. Kohut, *L. Feuerbach* (1909).

FEUERBACH, PAUL JOHANN ANSELM, RITTER VON (1775–1833), German jurist and writer on criminal law, was born at Hainichen near Jena on Nov. 14, 1775, and brought up at Frankfort on Main. At 16 he ran away from home to study at Jena. In spite of poor health and desperate poverty, he made his way, and took his doctorate in philosophy in 1795. Marriage in 1796 forced him to turn from his favourite studies of philosophy and history to law, which offered better prospects. In 1796 he published *Kritik des natürlichen Rechts als Propädeutik zu einer Wissenschaft der natürlichen Rechte*, followed by *Anti-Hobbes, oder über die Grenzen der bürgerlichen Gewalt* (1798), a dissertation on the limits of the civil power. Feuerbach, as the founder of a new theory of penal law, the so-called "psychological-coercive or intimidation theory," occupied a prominent place in the history of criminal science. His views, as expounded in his *Revision der Grundsätze und Grundbegriffe des positiven peinlichen Rechts* (1799), were further elucidated and expounded in the *Bibliothek für die peinliche Rechtswissenschaft* (1800–01), in which he had the assistance of Karl Grolmann and Harscher von Almendingen, and in his famous *Lehrbuch des gemeinen in Deutschland geltenden peinlichen Rechts* (1801). These works were a powerful protest against vindictive punishment, and furthered the reformation of the German criminal law. The administration of justice was, before Feuerbach's time, distinguished by two characteristics: the superiority of the judge to all law, and the blending of the judicial and executive offices. Feuerbach, using as his chief weapon the *Revision der Grundbegriffe*, achieved the recognition of the formula, *nullum crimen, nulla poena sine lege* (no wrong and no

punishment without a remedy). He lectured at Jena, Kiel and Landshut between 1801 and 1805.

On being commanded by King Maximilian Joseph to draft a penal code for Bavaria (*Strafgesetzbuch für das Königreich Bayern*), he removed in 1805 to Munich, where he was given an appointment in the ministry of justice and was ennobled in 1808. Meanwhile the practical reform of penal legislation in Bavaria was begun under his influence in 1806 by the abolition of torture. In 1808 appeared the first volume of his *Merkwürdige Criminalfälle*, completed in 1811—a work of deep interest for its application of psychological considerations to cases of crime, and intended to illustrate the inevitable imperfection of human laws in their application to individuals. In his *Betrachtungen über das Geschworenengericht* (1811) Feuerbach declared against trial by jury, maintaining that the verdict of a jury was not adequate legal proof of a crime. Much controversy was aroused, and Feuerbach subsequently modified his view. The Bavarian penal code was promulgated in 1813. It was at once made the basis for new codes in Württemberg and Saxe-Weimar; it was adopted in its entirety in the grand-duchy of Oldenburg; and it was translated into Swedish by order of the king. Several of the Swiss cantons reformed their codes in conformity with it.

During the war of liberation (1813–14) Feuerbach published several political brochures which, from the writer's position, had almost the weight of State manifestoes. One of these is entitled *Über deutsche Freiheit und Vertretung deutscher Völker durch Landstände* (1814). In 1814 Feuerbach was appointed second president of the court of appeal at Bamberg, and three years later he became first president of the court of appeals at Anspach. In 1821 he was deputed by the Government to visit France, Belgium, and the Rhine provinces for the purpose of investigating their juridical institutions. As the fruit of this visit, he published his treatises *Betrachtungen über Öffentlichkeit und Mündigkeit der Gerechtigkeitspflege* (1821) and *Über die Gerichtsverfassung und das gerichtliche Verfahren Frankreichs* (1825). In these he pleaded unconditionally for publicity in all legal proceedings. Feuerbach died suddenly at Frankfurt on May 29, 1833.

See *Leben und Wirken Ans. von Feuerbachs* (2 vols., 1853), consisting of a selection of his letters and journals, with occasional notes by his fourth son Ludwig, a distinguished philosopher. See also E. Hölder, *Savigny und Feuerbach, die Koryphäen der deutschen Rechtswissenschaft* (1881).

FEUILLANTS, CLUB OF THE, a political association which played a prominent part during the French Revolution. It was founded on July 16, 1791, by several members of the Jacobin Club, who refused to sign a petition presented by this body, demanding the deposition of Louis XVI. Among them were Barère and Sieyès. The name of Feuillants was popularly given to this group because they met in the house in the rue Saint-Honoré which had been occupied by the religious order bearing this name. The official name of the club was *Société des amis de la Constitution*, its object being to support the constitution of 1791 against the *émigrés* on the one hand and the Jacobins on the other. With the rapid growth of extreme democratic ideas the Feuillants soon began to be looked upon as reactionaries, and to be classed with "aristocrats." A few days after the insurrection of August 10 their papers were seized, and 841 members were proclaimed as suspects. This was the death-blow of the club; but the name of Feuillants, as a party designation, survived. It was applied to those who advocated a policy of "cowardly moderation," and *feuillantisme* was associated with *aristocratie* in the mouths of the sansculottes. (See FRANCE: History.) See also A. Aulard, *Histoire politique de la Révolution française* (1903), 2nd. ed., p. 153.

FEUILLET, OCTAVE (1821–1890), French novelist and dramatist, was born at Saint-Lô, Manche, on Aug. 11, 1821. He was educated at the lycée Louis-le-Grand, Paris, and was intended for the diplomatic profession. He became a novelist much against the will of a nervous and irritable father, who cut off his allowance for some years. He had already made himself a name when he obeyed an urgent summons from his father to return home. There he was virtually a prisoner, in constant attendance on the invalid, but there, nevertheless, his work gained in depth and power. His exile was lightened by his marriage with his

cousin, Valerie Feuillet. At Saint-Lô he wrote *Bellah* (1852); *La Crise* (1852), a drama; *La Petite Comtesse* (1857); *Dalila* (1857); and his most popular work, *Le Roman d'un jeune homme pauvre* (1858). Both the two last-named were dramatized, and Feuillet broke away from Saint-Lô to Paris in each case to see the first performance. During the second of these absences his father died. He was now free, and was much courted and fêted in Paris. His plays were performed at Compiègne before they were given on the public stage, and Empress Eugénie herself played Madame de Pons in *Les Portraits de la Marquise*. After the publication of *Sibylle* (1862) he left Paris and established himself at "Les Paillers," a house near Saint-Lô. His nerves had suffered during his long attendance on his father, and after a time he sold "Les Paillers," and lived a rather sad and wandering life. The best of his numerous novels, *Monsieur de Camors* (1867) and *Julia de Trécoeur* (1872), appeared during these years. He died in Paris on Dec. 29, 1890.

See Sainte-Beuve, *Nouveaux Lundis*, vol. v.; F. Brunetière, *Nouveaux Essais sur la Littérature Contemporaine* (1895); Deres, *Octave Feuillet* (1902).

FEUILLETON, originally a kind of supplement attached to the political portion of French newspapers. Its inventor was Bertin the elder, editor of the *Débats*. It was usually separated from the political part of the newspaper by a line, and printed in smaller type. In French newspapers it consists chiefly of non-political news and gossip, literature and art criticism, a chronicle of fashions, epigrams, charades, etc. The term has come into English use to indicate the instalment of a serial story printed in one part of a newspaper.

FEUQUIÈRES, ISAAC MANASSÈS DE PAS, MARQUIS DE (1590-1640), French soldier and diplomatist, born at Saumur on June 1, 1590, served in the Valtelline (1626), at La Rochelle (1628-29), in Lorraine, and in Germany (1636-39). He was repeatedly employed by Richelieu on diplomatic missions. He renewed at Heilbronn (April 19, 1633), the treaty of alliance with Sweden. He was also employed in the tortuous negotiations at Frankfurt in 1634. Feuquières was killed at the siege of Thionville (Diedenhofen). His *Lettres inédites* appeared (ed. Gallois) in Paris in 1845.

His nephew Antoine Manassès de Pas, Marquis de Feuquières (1648-1711), served in the French campaigns under Luxemburg and Catinat, and was given the rank of lieutenant-general as a result of his defence of Speierbach in 1692. He subsequently quarrelled with Marshal Villeroi, and failed to obtain the expected marshal's baton on the resumption of war in 1701. He spent the rest of his life compiling his memoirs, which were considered in the 18th century the standard work on the art of war, although they are embittered by his failure to obtain promotion, and coloured by his personal prejudices. The *Mémoires de la guerre* (1701, 1711, 1725, 1735, etc., London 1736, Amsterdam subsequently) were translated into English (1737) and German (Leipzig, 1732). They deal in detail with every branch of the art of war and of military service.

FÉVAL, PAUL HENRI CORENTIN (1817-1887), French novelist and dramatist, was born at Rennes in Brittany, and much of his best work deals with the history of his native province. He was educated for the bar, but after his first brief he went to Paris and began to write. The *Mystères de Londres* (1844) was published under the pseudonym "Sir Francis Trollope." Others of his novels are: *Le Fils du diable* (1846); *Les Compagnons du silence* (1857); *Le Bossu* (1858); *Le Poisson d'or* (1863); *Les Habits noirs* (1863); *Jean le diable* (1868), and *Les Compagnons du trésor* (1872). Some of his novels were dramatized. His chronicles of crime exercised an evil influence, eventually recognized by the author himself. In his later years he became an ardent Catholic, and occupied himself in revising his earlier works from his new standpoint and in writing religious pamphlets. He died of paralysis in the monastery of the Brothers of Saint John in Paris on March 8, 1887. His *Oeuvres* (38 vols.) appeared in 1895.

His son, **PAUL FÉVAL** (1860-), became well known as a

novelist and dramatist. Among his works are *Nouvelles* (1890), *Maria Laura* (1891) and *Chantepie* (1896).

FEVER, a term generally used for conditions in which the normal temperature of the animal body is raised for any length of time. This normal varies in different animals, and in man is 98.4°. When the temperature reaches 106° in man the term hyperpyrexia (excessive fever) is applied. The patient's condition then is very serious and if it exceeds 107° or 108° death results except in some cases of sun- or heat-strokes. Occasionally the temperature rises to 110°-112° immediately before death. (For the treatment of fever in general see THERAPEUTICS). (For the specific fevers see SMALL-POX, SCARLET FEVER, TYPHOID FEVER, etc.).

Pathology.—Every rise of temperature is due to a disturbance in the heat-regulating mechanism, the chief variable of which is the action of the skin in eliminating heat (see ANIMAL HEAT). This mechanism works satisfactorily but not instantaneously, and many physiological conditions cause a transient rise of temperature; e.g. severe muscular exercise, in which the cutaneous mechanism is unable at once to dispose of the increased amount of heat produced in the muscles. Pathologically, it may be disturbed in three different ways: 1st, by mechanical interference with the nervous system; 2nd, by interference with heat loss; 3rd, by the action of various poisons.

1.—In man, fever the result of *mechanical interference* with the nervous system rarely occurs, the nearest approach being haemorrhage into the basal ganglia or pons, but it can readily be produced in lower animals by stimulating certain parts of the great brain, e.g. the anterior portion of the corpus striatum. This leads to a rise of temperature with increased heat production. The high temperature seems to cause disintegration of cell protoplasm and increased excretion of nitrogen and of carbonic acid. Possibly some of the cases of high temperature recorded after injuries to the nervous system are caused in this way; but some may also be due to stimulation of vaso-constrictor fibres to the cutaneous vessels diminishing heat loss.

2.—Fever may readily be produced by *interference with heat loss*. It occurs when animals are exposed to a temperature slightly below that of the rectum, and is seen in man in *sunstroke*. The nervous symptoms of fever are produced, the rate of chemical change is accelerated, as is shown by the increased excretion of carbonic acid, the cells are injured and broken down as shown by degenerative changes and increased excretion of nitrogen.

3.—Many bacterial toxins and a few chemical substances cause a rise of temperature when injected in small doses and a fall when the dose is large. In all instances they lead to destruction of protein. Hence, the true measure of the intensity of a fever is not merely the temperature attained but the extent of disintegration of protoplasm. This may be estimated by the amount of nitrogen excreted in the urine, by a rise in the excretion of sulphur and phosphorus and by the appearance in the urine of acetone, aceto-acetic and β -oxybutyric acids (see NUTRITION). Further, a high temperature has of itself an injurious action on the protoplasm, and tends to increase disintegration just as when heat loss is experimentally retarded, though the increase is small compared to that produced by the destructive action of the microbial products. In the early stage of fever (rigors) the rise of temperature is primarily due to deficient heat loss, though increased production plays its part, and even in the later stages until defervescence occurs, heat loss is inadequate to get rid of the heat produced. The mechanism of increased heat production in fever is uncertain. In part, no doubt, it is due to increased muscular activity but in part it may be due to stimulation of the heat-producing centre by the products of tissue disintegration.

Probably as the result of toxic action fever is accompanied by disturbances in the functions of various organs. The activity of the *digestive glands* is diminished and appetite is lost. Food is not taken, the patient suffers from inanition, lives largely on his own fats and proteids, and rapidly emaciates. Glycogen is not stored in the *liver* cells, and bile is modified, the essential constituents disappearing almost entirely in some cases. The production of urea is interfered with, and the proportion of non-urea

nitrogen in the urine increases. This is in part due to the increased disintegration of proteids setting free sulphur and phosphorus, which, oxidized into sulphuric and phosphoric acids, combine with the ammonia which would otherwise have been changed to urea. Thus the proportion of ammonia in the urine is increased. Concurrently with these alterations in the functions of the liver-cells, granular, and probably fatty degeneration, make their appearance. That the functional activity of the *kidneys* is modified, is shown by the frequent occurrence of proteoses or of albumen and globulin in the urine. Frequently the toxin causes a shedding of the renal epithelium. The *muscles* are weakened, granular and fatty degeneration supervene, and the fibres waste. The *nervous structures*, especially the nerve-cells, suffer functionally and structurally. The *blood* shows a fall in alkalinity and variation in the number of leucocytes, chiefly, the polymorphonuclear variety. Thus in pneumonia, the normal number is often increased twofold and sometimes more than tenfold, while the numbers are often reduced in enteric fever.

FEYADILHA: see BARABRA.

FEYDEAU, ERNEST-AIME (1821–1873), French author, was born in Paris. He gained a great success with his novel *Fanny* (1858), followed in rapid succession by a series of similar stories. Besides his novels Feydeau wrote several plays. He died in Paris on Oct. 27, 1873. His son GEORGES (1862–1921) was a well known writer of comedy and farce. Examples are *La dame de chez Maxim* (1899) and *On purge Bébé* (1910).

See Sainte-Beuve, *Causeries du lundi*, vol. xiv., and Barbey d'Aurevilly, *Les Oeuvres et les hommes au XIX^e siècle*.

FEZ (Fās), capital of northern Morocco. Its historical importance as much as the numbers and the wealth of its population entitle Fez to be called the real centre—religious, political and economic—of the Shereefian empire. It lies in 34° 6' 3" N., 4° 38' 15" W., about 230 m. N.E. of Marrākesh, 100 m. E. from the Atlantic and 85 m. S. of the Mediterranean on the great line of communication between the Atlantic coast and Algiers. It is beautifully situated in a deep valley on the Wad Fās, an affluent of the Wad Sebu, which divides the town into two parts—the ancient town, Fās el Bali, on the right bank, and the new, Fās el Jadid, on the left.

Like many other Oriental cities, Fez from a distance appears a very attractive place. It stretches out between low hills, crowned by the ruins of ancient fortresses, and though there is nothing imposing, there is something particularly impressive in the sight of that white-roofed conglomeration of habitations, broken only by occasional mosque towers. Except on the south side the city is surrounded by hills, interspersed with groves of orange, pomegranate and other fruit trees, and large olive gardens.

From its peculiar situation Fez has a drainage superior to that of most Moorish towns. When the town becomes very dirty, the water is allowed to run down the streets by opening lids for the purpose in the conduits and closing the ordinary exits, so that it overflows and cleanses the pavements. The general dampness of the town renders it unhealthy, however, as the pallid faces of the inhabitants betoken, but this is considered a mark of distinction and is jealously guarded.

Streets and Trade.—Most of the streets are exceedingly narrow, and as the houses are high, and built in many cases over the thoroughfares, these are often very dark and gloomy, though, since wooden beams, rough stones and mortar are used in building, there is less of that ruined, half-decayed appearance so common in other

Moorish towns where mud concrete is the material employed.

As a commercial town Fez is a great depot for the trade of Barbary. The manufactures still carried on are those of yellow slippers of the famous Morocco leather, fine white woollen and silk haiks, of which it is justly proud, women's embroidered sashes, various coarse woollen cloths and blankets, cotton and silk handkerchiefs, silk cords and braids, swords and guns, saddlery, brass trays, Moorish musical instruments, rude painted pottery and coloured tiles. As in other capitals each trade has a district or street devoted chiefly to its activities. Old Fez is the business portion of the town, new Fez being occupied principally by Government quarters and the Jews' mellah.

Schools and Mosques.—In the early days of Mohammedan rule in Morocco, Fez was the seat of learning and the empire's pride. Its schools of religion, philosophy and astronomy enjoyed a great reputation in Africa and also in southern Europe, and were even attended by Christians. On the expulsion of the Moors from Spain, refugees of all kinds flocked to Fez, and brought with them some knowledge of arts, sciences and manufactures, and thither flocked students to make use of its extensive libraries. But its glories were brief, and though still "the university town" of Morocco, it retains but a shadow of its greatness. There are about 1,500 students who read at the Karueein. They pay no rents, but buy the keys of the rooms from the last occupants, selling them again on leaving.

The Karueein is celebrated as the largest mosque in Africa. On account of the vast area covered, the roof, supported by 366 pillars of stone, appears very low. The side chapel for services for the dead contains 24 pillars. All these columns support horseshoe arches, on which the roof is built, long vistas of arches being seen from each of the 18 doors of the mosque. The large lamp is stated to weigh 1,763 lb. and to have 509 lights, but it is very seldom lit. The total number of lights in the Karueein is given as 1,700. The mosque of Mulai Idris, built by the founder of Fez about the year 810, is considered so sacred that the streets which approach its entrance are forbidden to Jews, Christians or four-footed beasts. The sanctity of the shrine in particular is esteemed very great.

Since Morocco was placed under French protection in 1912 a new city has grown up 5 km. to the west of the old town, leaving the picturesque charm of the latter unspoilt. This new European town lies between the old one and the station of the railway which connects Fez with Rabat, Casablanca and Tangiers and continues as far as Taza, Oujda and Algiers. Of its population of 81,172, 77,613 are natives (70,060 Mohammedan, 7,553 Jewish) and 3,559 are Europeans (3,053 French).

According to tradition Fez was founded in 808 by Idris II., son of Idris I. descended from Ali, the son-in-law of the Prophet. The original town consisted of the quarter of the people of Quairan and the Andalusian quarter. In the 13th century Fez, Jeded and many other beautiful *medersas* or colleges were built to house the foreign students; some are still standing, and are the purest examples of Spanish-Moorish art in Morocco. Fez had then 125,000 inhabitants, but the city declined under the Saadi and Filali sharifs. On May 21, 1911, the French entered Fez at the request of the sultan, Mulai Hafid. It was at Fez that M. Regnault signed the treaty of March 30, 1912, establishing the French protectorate over Morocco. A riot broke out, and Fez was besieged by the Berbers, but order was restored by General Lyautey.

FEZZAN (the ancient *Phazania*, or country of the Garamantes) (see GHADAMES), a region of the Sahara, forming nominally the southern part of the Italian colony of Tripolitania, though it is not yet effectively occupied. The general form of the country is determined by the ranges of hills, including the Jebel-es-Suda (highest peak about 4,000 ft.), the Haruj-el-Aswad and the Haruj-el-Abiad, which between 14° and 19° E. and 27° and 29° N. form the northern edge of a broad desert plateau, and shut off the northern region draining to the Mediterranean from

the depressions in which lie the oases of Fezzan proper in the south. The central depression of Hofra ("ditch"), as it is called, lies in about 26° N. It does not form a continuous fertile tract, but consists of a monotonous sandy expanse somewhat more thickly studded with oases than the surrounding wastes. The Hofra at its lowest part is not more than 600 ft. above the sea-level, and in this hollow is situated the capital Murzuk. It has a general east to west direction. North-west of the Hofra is a long narrow valley, the Wadi-el-Gharbi, which trends north-east and is the most fertile district of Fezzan. It contains several perennial springs and lake-like basins. One of these basins, the saline Bahrel-Dud ("Sea of Worms"), has an extent of 600 sq.m., and is in places 26 ft. deep. Southwards the Hofra rises to a height of 2,000 ft., and in this direction lies the oasis of Gatron, followed by Tejerri on the verge of the desert, which marks the southern limit of the date and the northern of the dum palm. Beyond Tejerri the Saharan plateau rises continuously to the Tibesti highlands.

Climate.—The average temperature of Murzuk was found by Rohlfis to be 70° F. Frost is not uncommon in the winter months. The climate is a very regular one, and is in general healthy, the dryness of the air in summer making the heat bearable. An almost perpetual blue sky overhangs the desert, and the people of Fezzan are so unaccustomed to and so ill-prepared for wet weather that, as in Tuat and Tidikelt, they pray to be spared from rain. Water is found almost everywhere at small depths.

Flora and Fauna.—The date-palm is the characteristic tree of Fezzan, and constitutes the chief wealth of the land. In the oasis of Murzuk alone more than 30 varieties are counted, the most esteemed being named the Tillis, Tuati and Auregh. Besides the date there are numerous olive, fig and almond trees. Various grains are cultivated. Wheat and barley are sown in winter, and in spring, summer and autumn several kinds of durra, especially ksob and gafoli. Cotton flourishes, is perennial for six or seven years, and gives large pods of moderate length of staple.

In the uninhabited oases gazelles and antelopes are occasionally found. The most important animal is the camel, of which there are two varieties, the Tebu or Sudan camel and the Arabian, differing very much in size, form and capabilities. Horses and cattle are not numerous. Among birds are ostriches, falcons, vultures, swallows and ravens; in summer wild pigeons and ducks are numerous, but in winter they seek a warmer climate. There are no remarkable insects or snakes. A species of *Artemia* or brine shrimp, about a quarter of an inch in length, of a colour resembling the bright hue of the gold fish, is fished for with cotton nets in the "Sea of Worms," and, mixed with dates and kneaded into a paste, which has the taste and smell of salt herring, is considered a luxury by the people of Fezzan.

Inhabitants.—The total population is estimated at between 50,000 and 80,000. The inhabitants are a mixed people, derived from the surrounding Teda and Bornu on the south, Tuareg of the plateaus on the west, Berbers and Arabs from the north. The primitive inhabitants, called by their Arab conquerors Berāuna, are believed to have been of Negro origin. They no longer persist as a distinct people. In colour the present inhabitants vary from black to white, but the prevailing hue of skin is a Malay-like yellow, the features and woolly hair being Negro. The chief languages are the Kanuri or Bornu language and Arabic. Many understand Targish, the Teda and the Hausa tongues. If among such a mixed people there can be said to be any national language, it is that of Bornu, which is most widely understood and spoken. The people of Sokna, north of the Jebel-es-Suda, have a peculiar Berber dialect which Rohlfis found to be very closely allied to that of Ghadames. The men wear a haik or barakan like those of Tripoli, and a fez; short hose, and a large loose shirt called mansaria, with red or yellow slippers, complete their toilet. Yet one often sees the large blue or white *tobe* of Bornu, and the *litham* or shawl-muffler of the Tuareg, wound round the mouth to keep out the blown sand of the desert. The women, who so long as they are young have very plump forms, and who are generally small, are more simply dressed, as a rule, in the barakan, wound round their bodies; they seldom wear shoes, but generally

have sandals made of palm leaf. Like the Arab women they load arms and legs with heavy metal rings, which are of silver among the more wealthy. The hair, thickly greased with butter, soon catching the dust which forms a crust over it, is done up in numberless little plaits round the head, in the same fashion as in Bornu and the Hausa countries. Children run about naked until they attain the age of puberty, which comes very early, for mothers of ten or twelve years of age are not uncommon. The Fezzani are of a gay disposition, much given to music and dancing.

Towns and Trade.—Murzuk, the present capital, lies in the western corner of the Hofra depression, in 25° 55' N. and 14° 10' E. It was founded about 1310, about which time the *kasbah* or citadel was built. The Turks repaired it, as well as the town-wall, which has, however, again fallen into a ruinous condition. Murzuk had in 1906 some 3,000 inhabitants. The citadel and most of the houses are built of salt-saturated dried mud. Sokna, about midway between Tripoli and Murzuk, situated on a great gravel plain north of the Suda range, has a population of about 2,500.

Garama (Derma-el-Kedima north-east of Murzuk), the capital under the Garamantes and the Romans, was in the Wadi-el-Gharbi. It was a flourishing town at the time of the Arab conquest but is now deserted. Among the ruins is a well-preserved stone monument marking the southern limit of the Roman dominions in this part of Africa. Zuila, the capital under the Arabs, lies in a depression called the Sherguia east of Murzuk on the most direct caravan route to Barca and Egypt. Of Traghen, the capital under the Nesur dynasty, which was on the same caravan route and between Zuila and Murzuk, little besides the ruined kasbah remains.

Placed roughly midway between the countries of the central Sudan and Tripoli, Fezzan serves as a depot for caravans crossing the Sahara. Its most important export is that of dates.

See C. Zoli, *Nel Fezzan* (Milan, Alfieri and Lacroix, 1926). The scanty rock sculptures of Fezzan are described by Zoli in *Rivista delle colonie italiane* i. (1927) 7-13 and indicate that the Garamantes (as ancient authors also tell us) possessed oxen.

History.—The country formed part of the territory of the Garamantes, described by Herodotus as a very powerful people. Attempts have been made to identify the Garamantes with the Berāuna of the Arabs of the 7th century, and to the period of the Garamantes Duveyrier assigns the remains of remarkable hydraulic works, and certain tombs and rock sculptures—indications, it is held, of a Negro civilization of ancient date which existed in the northern Sahara. The Garamantes, whether of Libyan or Negro origin, had certainly a considerable degree of civilization when in the year 19 B.C. they were conquered by the proconsul L. Cornelius Balbus Minor and their country added to the Roman empire. By the Romans it was called Phazania, whence the present name Fezzan. After the Vandal invasion Phazania appears to have regained independence and to have been ruled by a Berāuna dynasty. At this time the people were Christians, but in 666 the Arabs conquered the country and all traces of Christianity seem speedily to have disappeared. About the middle of the 16th century the people of Fezzan were rescued from slavery to the Arab tribe of Khorman by a sherif of Morocco, Montasir-b.-Mohammed, who founded the dynasty of Beni Mohammed. This dynasty, which came into frequent conflict with the Turks in Tripoli, gradually extended its borders as far as Sokna in the north. It was the Beni Mohammed who chose Murzuk as their capital. They became intermittently tributary to the pasha of Tripoli, but within Fezzan the power of the sultans was absolute. The last of the Beni Mohammed sultans was killed in the vicinity of Traghen in 1811 by El-Mukkeni, one of the lieutenants of Yusef Pasha, the last sovereign but one of the independent Karamanli dynasty of Tripoli. El-Mukkeni now made himself sultan of Fezzan, and became notorious by his slaving expeditions into the central Sudan, in which he advanced as far as Bagirmi. In 1831, Abd-el-Jelil, a chief of the Walid-Sliman Arabs, usurped the sovereign authority. After a troublous reign of ten years he was slain in battle by a Turkish force under Bakir Bey, and Fezzan was added to the Turkish empire. With the rest of Tripolitania, it was seized by Italy in 1911 but not occupied till 1914.

FIACRE, SAINT (Celt. *Fiachra*), an anchorite of the 7th century, of noble Irish descent. His *Acta*, which have little historical value, relate that he went to France and with the permission of St. Faro, the bishop of Meaux, built a monastery at Prodilus (Brodolium), the modern Breuil, in the province of Brie. Here he received St. Chillen (? Killian), who was returning from a pilgrimage to Rome, and here he remained until his death. In 1568, at the time of the religious troubles, his remains were transferred to their present shrine in the cathedral of Meaux. St. Fiacre is the patron of Brie, and gardeners invoke him as their protector; his feast is kept on Aug. 30.

See O'Hanlon, *Lives of the Irish Saints*, viii. 421-447 (Dublin, 1875-1904).

FIARS PRICES, in the law of Scotland, the average prices of each of the different sorts of grain grown in each county, as fixed annually by the sheriff, usually after the verdict of a jury; they serve as a rule for ascertaining the value of the grain due to feudal superiors, to the clergy, or to lay proprietors of *teinds*, to landlords as a part or the whole of their rents, and in all cases where the price of grain has not been fixed by the parties. It is not known when or how the practice of "striking the fiars," as it is called, originated. It probably was first used to determine the value of the grain rents and duties payable to the crown. In confirmation of this view it seems that at first the duty of the sheriffs was merely to make a return to the court of exchequer of the prices of grain within their counties, the court itself striking the fiars; and from an old case it appears that the fiars were struck above the true prices, being regarded rather as punishments to force the king's tenants to pay their rents than as the proper equivalent of the grain they had to pay. Co-existent, however, with these fiars, which were termed sheriffs' fiars, there was at an early period another class called commissaries' fiars, by which the values of *teinds* were regulated. They have been traced back to the Reformation and were under the management of the commissary or consistorial courts, which then took the place of the bishops and their officials. They have been long out of use, but they were perhaps of greater antiquity than the sheriff's fiars and the model upon which these were instituted.

In 1723 the court of session passed an Act of Sederunt for the purpose of regulating the procedure in fiars courts. Down to that date the practice of striking the fiars was by no means universal over Scotland; and even in those counties into which it had been introduced, there was, as the preamble of the act puts it, "a general complaint that the said fiars are struck and given out by the sheriffs without due care and inquiry into the current and just prices." The act in consequence provided that all sheriffs should summon annually, between Feb. 4 and 20, a competent number of persons, living in the shire, of experience in the prices of grain within its bounds, and that from these they could choose a jury of 15, of whom at least eight were to be heritors; that witnesses and other evidence as to the price of grain grown in the county, especially since Nov. 1 preceding until the day of inquiry, were to be brought before the jury, who might also proceed on "their own proper knowledge"; that the verdict was to be returned and the sentence of the sheriff pronounced by March 1; and further, where custom or expediency recommended it, the sheriff was empowered to fix fiars of different values according to the different qualities of the grain. It cannot be said that this act has remedied all the evils of which it complained. The propriety of some of its provisions has been questioned and the competency of the court to pass it has been doubted, even by the court itself. Its authority has been entirely disregarded in one county—Haddingtonshire—where the fiars are struck by the sheriff alone, without a jury; and when this practice was called in question the court declined to interfere, observing that the fiars were better struck in Haddingtonshire than anywhere else. The other sheriffs have in the main followed the act but with much variety of detail, and in many instances on principles the least calculated to reach the true average prices. Thus in some counties the averages are taken on the number of transactions, without regard to the quantities sold. In one case, in 1838, the evidence was so carelessly collected that the second or inferior barley fiars were 2s. 4d. higher than the first. Formerly

the price was struck by the boll, commonly the Linlithgowshire boll; now the imperial quarter is always used.

FIASCO, originally a flask or bottle, and by derivation, probably in the sense of breaking, used figuratively of a breakdown or failure in a dramatic performance or other undertaking.

FIAT (FABBRICA ITALIANA AUTOMOBILI TORINO), Italian motor car company was founded in 1898. The original car was specially designed to cope with mountain conditions in Northern Italy, and gave great satisfaction in this connection for reliability and durability. The *Fiat* cars subsequently won numerous successes in road and track events. The works at Turin soon became one of the largest in Europe, and rank among the finest and best equipped in the world. Their equipment may be gathered from the fact that the roof is a testing-track, 78 ft. wide, nearly three-quarters of a mile round, placed over 100 ft. above ground level. During the World War the resources of the company were taxed to the utmost. Employment was found for 30,000 workers; over 100 cars and lorries were produced daily; while in the output of aero engines the company ranked with the first in the world.

In the sphere of aeroplane engineering the company is proud of the fact that *Fiat* engines made possible the phenomenal world air speed record (1928) of 319 m.p.h. and the world's long distance flight record (1928) from Rome to Brazil, a distance of 4,850 miles. The company produces, on a large scale, motor cars, commercial vehicles, agricultural tractors, marine engines, locomotives, railway trucks and carriages, aviation engines, etc.

(M. N.)

FIAT MONEY, irredeemable money issued and made legal by Government order (*fiat*) but not secured by a gold or silver or other adequate reserve. It is usually paper but may also consist of coins of baser metals whose metallic content is worth far less than their face value. The issue of fiat money tends to cause the withdrawal from circulation of sound money and a great inflation of prices in terms of the unsecured currency. Fiat money was issued freely in the United States during the Revolutionary War and the Civil War periods. The "greenbacks" of the Civil War period were fiat money but under the Specie Resumption Act of 1875 were made redeemable and thus became real money.

FIBIGER, JOHANNES (1868-1928), Danish pathologist and professor at the University of Copenhagen, acquired universal fame by his researches into cancer in rats and cockroaches, which culminated in the first experimental production of that disease. While examining tubercular rats, Fibiger found three with cancer of the stomach. These cancers contained a parasite (afterwards called *spiroptera neoplastica*), which he was able to trace to an uncommon type of cockroach that had come in sugar from the West Indies. When the cockroaches were eaten by the rats infesting the particular sugar factory, the larvae coiled up in their muscles developed into the adult nematodes in the stomachs of the rats. By feeding rats in this way Fibiger was able to induce cancer in them, though not in other animals. He was awarded the Nobel Prize in 1927.

FIBONACCI, LEONARDO: see LEONARDO OF PISA.

FIBRES, the general term for certain structural components of animal and vegetable tissue utilized in manufactures, and in respect of such uses, divided for the sake of classification into textile, paper-making, brush and miscellaneous fibres.

Textile Fibres.—Textile fibres are mostly products of the organic world, elaborated in their elongated form to subserve protective functions in animal life (as wool and epidermal hairs, etc.) or as structural components of vegetable tissues (flax, hemp and wood cells). It may be noted that the inorganic world provides an exception to this general statement in the fibrous mineral asbestos (*q.v.*), which is spun or twisted into coarse textiles. Other silicates are also transformed by artificial processes into fibrous forms, such as "glass," which is fused and drawn or spun to a continuous fibre, and various "slags" which, in the fused state, are transformed into "slag wool." Lastly, we note that a number of metals are drawn down to the finest dimensions, in continuous lengths, and these are woven into cloth or gauze, such metallic cloths finding valuable applications in the arts. Certain

metals in the form of fine wire are woven into textile fabrics used as dress materials. Such exceptional applications are of insignificant importance, and will not be further considered in this article.

The common characteristics of the various forms of matter comprised in the widely diversified groups of textile fibres are those of the colloids. Colloidal matter is intrinsically devoid of structure, and in the mass may be regarded as homogeneous; whereas crystalline matter in its proximate forms assumes definite and specific shapes which express a complex of internal stresses. The properties of matter which condition its adaptation to structural functions, first as a constituent of a living individual, and afterwards as a textile fibre, are homogeneous continuity of substance, with a high degree of interior cohesion, and associated with an irreducible minimum of elasticity or extensibility. The colloids show an infinite diversity of variations in these essential properties: certain of them, and notably cellulose (*q.v.*), maintain these characteristics throughout a cycle of transformations such as permit of their being brought into a soluble plastic form, in which condition they may be drawn into filaments in continuous length. The artificial silks or lustra-celluloses or rayons are produced in this way, and have already taken an established position as staple textiles. For a more detailed account of these products see CELLULOSE and SILK, ARTIFICIAL.

The animal fibres are composed of nitrogenous colloids of which the typical representatives are the albumens, fibrines and gelatines. They are of highly complex constitution and their characteristics have only been generally investigated. The vegetable fibre substances are celluloses and derivatives of celluloses, also typically colloidal bodies. The broad distinction between the two groups is chiefly evident in their relationship to alkalis. The former group are attacked, resolved and finally dissolved, under conditions of action by no means severe. The celluloses, on the other hand, and therefore the vegetable fibres, are extraordinarily resistant to the action of alkalis.

The animal fibres are relatively few in number but of great industrial importance. They occur as detached units and are of varying dimensions; sheep's wool having lengths up to 36in., the fleeces being shorn for textile uses at lengths of 2 to 16in.; horse hair is used in lengths of 4 to 24in., whereas the silks may be considered as being produced in continuous length, "reeled silks" having lengths measured in hundreds of yards, but "spun silks" are composed of silk fibres purposely broken up into short lengths.

The vegetable fibres are extremely numerous and of very diversified characteristics. They are individualized units only in the case of seed hairs, of which cotton is by far the most important; with this exception they are elaborated as more or less complex aggregates. The bast tissues of dicotyledonous annuals furnish such staple materials as flax, hemp, reha or ramie and jute. The bast occurs in a peripheral zone, external to the wood and beneath the cortex, and is mechanically separated from the stem, usually after steeping, followed by drying.

The commercial forms of these fibres are elongated filaments composed of the elementary bast cells (ultimate fibres) aggregated into bundles. The number of these bundles, of any part of the filament may vary from 3 to 20. In the processes of refinement preparatory to the spinning (hackling, scutching) and in the spinning process itself, the fibre-bundles are more or less subdivided, and the divisibility of the bundles is an element in the textile value of the raw material. But the value of the material is rather determined by the length of the ultimate fibres (for, although not the spinning unit, the tensile strength of the yarn is ultimately limited by the cohesion of these fibres), qualified by the important factor of uniformity.

Thus, the ultimate fibre of flax has a length of 25 to 35mm.; jute, on the other hand, 2 to 3mm.; and this disparity is an essential condition of the difference of values of these fibres. Reha or ramie, to cite another typical instance, has an ultimate fibre of extraordinary length, but of equally conspicuous variability, viz., from 50 to 200mm. The variability is a serious impediment in the preparation of the material for spinning and this defect, together with low drawing or spinning quality, limits the applica-

tions of this fibre to the lower counts or grades of yarn.

The monocotyledons yield still more complex fibre aggregates, which are the fibro-vascular bundles of leaves and stems. These complex structures as a class do not yield to the mechanical treatment by which the bast fibres are subdivided, nor is there any true spinning quality such as is conditioned by bringing the ultimate fibres into play under the drawing process, which immediately precedes the twisting into yarn. Such materials are therefore only used for the coarsest textiles, such as string or rope. An exception to be noted in passing is to be found in the pineapple (*Ananas Sativus*) the fibres of which are worked into yarns and cloth of the finest quality. The more important fibres of this class are manila, sisal, phormium. A heterogeneous mass of still more complex fibre aggregates, in many cases the entire stem (cereal straws, esparto), in addition to being used in plaited form, e.g., in hats, chairs, mats, constitute the staple raw material for paper manufacturers, requiring a severe chemical treatment for the separation of the ultimate fibres.

In this class we must include the woods which furnish wood pulps of various classes and grades. Chemical processes of two types (a) acid and (b) alkaline, are also employed in resolving the wood, and the resolution not only effects a complete isolation of the wood cells, but, by attacking the hydrolysable constituents of the wood substance (lignocellulose), the cells are obtained in the form of cellulose. These cellulose pulps are known in commerce as "sulphite pulps" and "soda pulps" respectively. In addition to these raw materials or "half stuffs" the paper-maker employs the rejecta of the vegetable and textile industries, scutching, spinning and cloth wastes of all kinds, which are treated by chemical (boiling) and mechanical means (beating) to separate the ultimate fibres and reduce them to the suitable dimensions (0.5-2.0mm.). These paper-making fibres have also to be reckoned with as textile raw materials, in view of a new and growing industry in "pulp yarns" (*Papierstoffgarn*), a coarse textile obtained by treating paper as delivered in narrow strips from the paper machine; the strips are reeled, dried to retain 30-40% moisture, and in this condition subjected to the twisting operation, which confers the cylindrical form and adds considerably to the strength of the fibrous strip. The following are the essential characteristics of the economically important fibres.

Animal Fibres.—A. Silk. (a) The true silks are produced by the *Bombyx mori*, the worm feeding on the leaves of the mulberry. The fibre is extruded as a viscous liquid from the glands of the worm, and solidifies to a cylindrical thread. The cohesion of these threads in pairs gives to raw silk the form of a dual cylinder. If they are used for textile purposes the thread is reeled from the cocoon, and several units, five and upwards, are brought together and suitably twisted. (b) The "Wild" silks are produced by a large variety of insects, of which the most important are the various species of *Antherea*, which yield the Tussore silks. These silks differ in form and composition from the true silks. While they consist of a "dual" thread, each unit of these is complex, being made up of a number of fibrillae. This unit thread is quadrangular in section, and of larger diameter than the true silk, the mean breadth being 0.052mm., as compared with 0.018, the mean diameter of the true silks. The variations in structure as well as in dimensions are, however, very considerable.

B. Epidermal hairs. Of these (a) wool, the epidermal protective covering of sheep, is the most important. The varying species of the animal produce wools of characteristic qualities, varying considerably in fineness, in length of staple, in composition and in spinning quality. Hence the classing of the fleeces or raw wool followed by the elaborate processes of selection, i.e., "sorting" and preparation, which precede the actual spinning or twisting of the yarn. These consist in entirely freeing the fibres and sorting them mechanically (combing, etc.), thereafter forming them into continuous lengths of parallelized units. This is followed by the spinning process which consists in a simultaneous drawing and twisting, and a continuous production of the yarn with the structural characteristics of *worsted* yarns. The shorter staple—from 5 to 25% of average fleeces—is prepared by the "carding" process for the spinning operation, in which drawing and twisting

are simultaneous, the length spun being then wound up, and the process being consequently intermittent. This section of the industry is known as "woollen spinning" in contrast to the former or "worsted spinning." (b) An important group of raw material closely allied to the wools are the epidermal hairs of the Angora goat (mohair), the llama, alpaca. Owing to their form and the nature of the substance of which they are composed, they possess more lustre than the wools. They present structural differences from sheep wools which influence the processes by which they are prepared or spun, and the character of the yarns; but the differences are only of subordinate moment. (c) Various animal hairs, such as those of the cow, camel and rabbit, are also employed; the latter is largely worked into the class of fabrics known as felts. In these the hairs are compacted together by taking advantage of the peculiarity of structure which causes the imbrications of the surface. (d) Horse hair is employed in its natural form as an individual filament or monofil.

Vegetable Fibres.—The subjoined scheme of classification sets out the morphological structural characteristics of the vegetable fibres:—

	Produced from
<i>Dicotyledons.</i>	<i>Monocotyledons.</i>
A. Seed hairs.	D. Fibro-vascular bundles.
B. Bast fibres.	E. Entire leaves and stems.
C. Bast aggregates.	

In the list of the more important fibrous raw materials subjoined,

the capital letter immediately following the name refers the individual to its position in this classification. In reference to the important question of chemical composition and the actual nature of the fibre substance, it may be premised that the vegetable fibres are composed of cellulose, an important representative of the group of carbohydrates, of which the cotton fibre substance is the chemical prototype, mixed and combined with various derivatives belonging to the subgroups. (a) Carbohydrates. (b) Unsaturated compounds of benzenoid and furfuroid constitutions. (c) "Fat and wax" derivatives, *i.e.*, groups belonging to the fatty series, and of higher molecular dimensions—of such compound celluloses the following are the prototypes:—

- Cellulose combined and mixed with "pectic" bodies (*i.e.*, pecto-celluloses), flax, rhea.
- Cellulose combined with unsaturated groups or ligno-celluloses, jute and the woods.
- Cellulose combined and mixed with higher fatty acids, alcohols, ethers, cuto-celluloses, protective epidermal covering of leaves.

The letters *a*, *b*, *c* in the table below and following the capitals, which have reference to the structural basis of classification, indicate the main characteristics of the fibre substances. (See also CELLULOSE.)

Miscellaneous Fibres.—Various species of the family Palmaceae yield fibrous products of value, of which mention must be

	Botanical identity. Genus and order.	Country of origin.	Dimensions of ultimate.	Textile uses.
Cotton, A.a . .	Gossypium Malvaceae	Subtropical and tropical countries	12-40mm. 0.019-0.025. Av. 28mm.	Universal. Also as a raw material in chemical industries, notably explosives, celluloid.
Flax, B.a . .	Linum Linaceae	Temperate countries, chiefly European	6-60mm. 0.011-0.025. Av. 28mm.	General. Special effects in lustre damasks. In India and America plants grown for seed (linseed).
Hemp, B.a . .	Cannabis Cannabineae	Temperate countries, chiefly Europe	5-55mm. 0.016-0.050. Av. 22mm. Av. 0.022	Coarser textiles, sail-cloth, rope and twine.
Ramie, B.a . .	Boehmeria Urticaceae	Warm temperate, China	60-200mm. 0.03-0.08. Av. 120mm. Av. 0.050	Clothing in China: "grass cloth." gas mantels.
Jute, B.b . .	Corchorus Tiliaceae	Tropical countries, chiefly India	1.5-5mm. 0.020-0.025. Av. 2.5mm. Av. 0.022	Coarse textiles, chiefly "Hessians" and sacking. "Line" spun yarns used in cretonne and furniture textiles.
Sunn-hemp, B.b .	Crotalaria Leguminosae	India	4.0-12.0. 0.025-0.050. Av. 7.5. Av. 0.022	Twine and rope. Coarse textiles.
Ambari, B.b . .	Hibiscus	Persia, Russia, India	2-6mm. 0.014-0.033. Av. 4mm. Av. 0.021	Coarse textiles. <i>H. Elms</i> has been extensively used in making mats.
Sida, B.b . .	Sida Malvaceae	Tropical and subtropical	1.5-4mm. 0.013-0.02. Av. 2mm. Av. 0.015	Coarse textiles. Appears capable of substituting jute.
Chingma, B.b	Abutilon Malvaceae	China Manchuria Japan		Coarse fabrics, twines.
Lime or Linden, C.b .	Tilia Tiliaceae	European countries, chiefly Russia	1.5mm. 0.014-0.020. Av. 2mm. Av. 0.016	Matting and binder twine.
Mulberry, C . .	Broussonetia Moraceae	Far East	5-31mm. 0.02-0.04. Av. 15mm. Av. 0.03	Paper and paper cloths.
Manila, D . .	Musa Musaceae	Tropical countries, chiefly Philippine Islands	3-12mm. 0.016-0.032. Av. 6mm. Av. 0.024	Twine and ropes. Produces papers of special quality.
Sisal, D . .	Agave Amaryllidaceae	Tropical countries	1.5-4mm. 0.020-0.032. Av. 2.5. Av. 0.024	Twine and ropes.
Yucca . . .	Yucca Liliaceae	do.	0.5-6mm. 0.01-0.02.	do.
Bow-string hemp.	Sansevieria Liliaceae	East Indies, Ceylon, East Africa	1.5-6mm. 0.015-0.026. Av. 3mm. Av. 0.020	do.
Phormium, D . .	Phormium tenax Liliaceae	New Zealand	5.0-15mm. 0.010-0.020. Av. 9mm. Av. 0.016	Twine and ropes. Distinguished by high yield of fibre from green leaf.
Pineapple, D . .	Ananas Bromeliaceae	Tropical East and West Indies	3.0-9.0mm. 0.004-0.008. Av. 5. Av. 0.006	Textiles of remarkable fineness. Exceptional fineness of ultimate fibre.
Henequén, D . .	Agave Amaryllidaceae	Yucatan, Cuba	1.5-4 mm. 0.02-0.03	Binder twine, rope.
Cantala, D . .	Agave Amaryllidaceae	Java, Philippines		Twines and ropes.
Tula ixtle, D . .	Agave Amaryllidaceae	Mexico		Twines, "Tampico," brushes.
Jaumave ixtle, D.	Agave Amaryllidaceae	Mexico		Twines, "Tampico," brushes.
Palma, D. . .	Samuela Yuccaeae	Mexico		Twines.
Piteira, D. . .	Furcraea Amaryllidaceae	Brazil, Mauritius	1.3-3.7 mm. 0.015-0.24	Ropes, sacks.

made of the following. *Raffia*, epidermal strips of the leaves of *Raphia ruffia* (Madagascar), *R. taedigera* (Japan), largely employed as binder twine in horticulture, replacing the "bast" (lin-den) formerly employed. *Coir*, the fibrous envelope of the fruit of the *Cocos nucifera*, extensively used for matting and other coarse textiles. *Carludovica palmata* (Central America) yields the raw material for Panama hats, the *Corypha australis* (Australia) yields a similar product. The leaves of the date palm, *Phoenix dactylifera*, are employed in making baskets and mats, and the fibro-vascular bundles are isolated for working up into coarse twine and rope; similarly, the leaves of the *Elaeis guineensis*, the fruit of which yields the "palm oil" of commerce, yield a fibre which finds employment locally for special purposes. *Chamaerops humilis*, the dwarf palm, yields the well-known "Crin d'Afrique." Locally (Algiers) it is twisted into ropes, but its more general use, in Europe, is in upholstery as a stuffing material. The cereal straws are used in the form of plait in the making of hats and mats. Esparto grass is also used in the making of coarse mats.

The processes by which the fibres are transformed into textile fabrics are in the main determined by their structural features. The following are the distinctive types of treatment:

A. The fibre is in virtually continuous lengths. The textile yarn is produced by assembling together the unit threads, which are wound together and suitably twisted (silk; artificial silk).

B. The fibres in the form of units of variable short dimensions are treated by more or less-elaborate processes of scutching, hackling, combing, with the aim of producing a mass of free parallelized units of uniform dimensions; these are then laid together and drawn into continuous bands of sliver and roving, which are finally drawn and twisted into yarns. In this group are comprised the larger number of textile products, such as cotton, wool, flax and jute, and it also includes at the other extreme the production of coarse textiles, such as twine and rope.

C. The fibres of still shorter dimensions are treated in various ways for the production of a fabric in continuous length.

The distinction of type of manufacturing processes in which the relatively short fibres are utilized, either as disintegrated units or comminuted long fibres, follows the lines of division into long and short fibres; the long fibres are worked into yarns by various processes, whereas the shorter fibres are agglomerated by both dry and wet processes to felted tissues or felts. It is obvious, however, that these distinctions do not constitute rigid dividing lines. Thus the principles involved in felting are also applied in the manipulation of long fibre fabrics. For instance, woollen goods are closed or shrunk by milling, the web being subjected to a beating or hammering treatment in an apparatus known as "the stocks," or is continuously run through squeezing rollers, in weak alkaline liquids. Flax goods are "closed" by the process of beetling, a long-continued process of hammering, under which the ultimate fibres are more or less subdivided, and at the same time welded or incorporated together. As already indicated, paper, which is a web composed of units of short dimensions produced by deposition from suspension in water and agglomerated by the interlacing of the component fibres in all planes within the mass, is a species of textile. Further, whereas the silks are mostly worked up in the extreme lengths of the cocoon, there are various systems of spinning silk wastes of variable short lengths, which are similar to those required for spinning the fibres which occur naturally in the shorter lengths.

The fibres thus enumerated as commercially and industrially important have established themselves as the result of a struggle for survival, and each embodies typical features of utility. There are innumerable vegetable fibres, many of which are utilized in the locality or region of their production, but are not available for the highly specialized applications of modern competitive industry to qualify for which a very complex range of requirements has to be met. These include primarily the factors of production and transport summed up in cost of production, together with the question of regularity of supply; structural characteristics, form and dimensions, including uniformity of ultimate unit and adaptability to standard methods of preparing and spinning, together with tenacity and elasticity, lustre. Lastly, composition, which

determines the degree of resistance to chemical disintegrating influences as well as subsidiary questions of colour and relationship to colouring matters. The quest for new fibres, as well as modified methods of production of those already known, require critical investigation from the point of view of established practice. The present perspective outline of the group will be found to contain the elements of a grammar of the subject. But those who wish to pursue the matter will require to amplify this outlined picture by a study of the special treatises which deal with general principles, as well as the separate articles on the various fibres.

Analysis and Identification.—For the analysis of textile fabrics and the identification of component fibre, a special treatise must be consulted. The following general facts are to be noted as of importance.

All animal fibres are effectively dissolved by 10% solution of caustic potash or soda. The fabric or material is boiled in this solution for ten minutes and exhaustively washed. Any residue will be vegetable or cellulose fibre. It must not be forgotten that the chemical properties of the fibre substances are modified more or less by association in combination with colouring matters and mordants. These may, in many cases, be removed by treatments which do not seriously modify the fibre substances.

Wool is distinguished from silk by its relative resistance to the action of sulphuric acid. The cold concentrated acid rapidly dissolves silk as well as the vegetable fibres. The attack on wool is slow, and the epidermal scales of wool make their appearance. The true silks are distinguished from the wild silks by the action of concentrated hydrochloric acid in the cold, which reagent dissolves the former, but has only a slight effect on Tussore silk. After preliminary resolution by these group reagents, the fabric is subjected to microscopical analysis for the final identification of its component fibres (see H. Schlichter, *Journal Soc. Chem. Ind.*, 1890, p. 241).

A scheme for the commercial analysis or assay of vegetable fibres, originally proposed by the author (Col. Ind. Exhibition, 1886, *Miscellaneous Reports*) and now generally adopted, includes the following operations:—

1. Determination of moisture.
2. Determination of ash left after complete ignition.
3. Hydrolysis:
 - (a) loss of weight after boiling the raw fibre with a 1% caustic soda solution for five minutes;
 - (b) loss after boiling for one hour.
4. Determination of cellulose: the white residue after
 - (a) boiling for five minutes with 1% caustic soda,
 - (b) exposure to chlorine gas for one hour,
 - (c) boiling with basic sodium sulphite solution.
5. Mercerizing: the loss of weight after digestion with a 20% solution of sodium hydrate for one hour in the cold.
6. Nitration: the weight of the product obtained after digestion with a mixture of equal volumes of sulphuric and nitric acids for one hour in the cold.
7. Acid purification: treatment of the raw fibre with 20% acetic acid for one minute, the product being washed with water and alcohol, and then dried.
8. Determination of the total carbon by combustion.

Paper-making.—The paper-making industry (see PAPER) employs as raw materials a large proportion of the vegetable fibre products already enumerated, and, for the reasons incidentally mentioned, they may be, and are, employed in a large variety of forms; in fact any fibrous material containing over 30% "cellulose" and yielding ultimate fibres of a length exceeding 1mm. can be used in this industry. Most important staples are cotton and flax; these are known to the paper-maker as "rag" fibres, rags, i.e., cuttings of textile fabrics, new and old, being their main source of supply. These are used for writing and drawing papers. In the class of "printings" two of the most important staples are wood pulp, prepared by chemical treatment from both pine and foliage woods, and in England esparto cellulose, the cellulose obtained from esparto grass by alkali treatment; the cereal straws

are also used and are resolved into cellulose by alkaline boiling followed by bleaching. In the class of "wrappings" and miscellaneous papers a large number of other materials find use, such as various residues of manufacturing and preparing processes, scutching wastes, ends of rovings and yarns, flax, hemp and manila rope waste, adansonia bast and jute wastes, raw (cuttings) and manufactured (bagging). Other materials have been experimentally tried, and would no doubt come into use on their paper-making merits, but as a matter of fact the actually suitable raw materials are comprised in the list above enumerated, and are limited in number, through the influence of a number of factors of value or utility.

Brush Fibres, Etc.—In addition to the textile industries there are manufactures which utilize fibres of both animal and vegetable character. The most important of these is brush-making. The familiar brushes of everyday use are extremely diversified in form and texture. The supplies of animal fibres are mainly drawn from the badger, hog, bear, sable, squirrel and horse. These fibres and bristles cover a large range of effects. Brushes required for cleansing purposes are composed of fibres of a more or less hard and resilient character, such as horse hairs, and other tail hairs and bristles. For painting work brushes of soft quality are employed, graduating for fine work into the extreme softness of the "camel hair" pencil. Of vegetable fibres the following are used in this industry. The *Caryota urens* furnishes the Kittul fibre, obtained from the base of the leaf stalks. Piassava is obtained from the *Attalea funifera*, also from the *Leopoldina piassaba* (Brazil). Palmyra fibre is obtained from the *Borassus flabellifer*. These are all members of the natural order of the Palmaceae. Mexican fibre, or Istle, is obtained from the agave. The fibre known as Whisk, largely used for dusting brushes, is obtained from various species of the Gramineae; the "Mexican Whisk" from *Epicampes macroura*; and "Italian Whisk" from *Andropogon*. The coir fibre mentioned above in connection with coarse textiles is also extensively used in brush-making. Aloe and agave fibres in their softer forms are also used for plasterers' brushes. Many of the whitewashes and cleansing solutions used in house decoration are alkaline in character, and for such uses advantage is taken of the specially resistant character of the cellulose group of materials.

Stuffing and Upholstery.—Another important use for fibrous materials is for filling or stuffing in connection with the seats and cushions in upholstery. In the large range of effects required, a corresponding number and variety of products find employment. One of the most important is the floss or seed-hair of the *Ceiba pentandria*, known as Kapok, the use of which in Europe was created by the Dutch merchants who drew their supplies from Java. The fibre is soft, silky and resilient, and maintains its resiliency in use. Many fibres when used in the mass show, on the other hand, a tendency to become matted and compressed in use, and to restore them to their original state the fibre requires to be removed and subjected to a teasing or carding process. This defect limits the use of other "flosses" or seed hairs in competition with Kapok. Horse hair is extensively used in this industry, as are also wool flocks and other short animal hairs and wastes.

For hat and matting manufactures a large range of the fibrous products above described are employed, chiefly in their natural or raw state. (See also ALPACA; COTTON; FELT; FLAX; HEMP; JUTE; MOHAIR; WOOL; CELLULOSE; SILK, ARTIFICIAL; SHODDY; SILK; RAMIE; KAPOK; FUR, etc.)

BIBLIOGRAPHY.—The list of works appended comprises only a small fraction of the standard literature of the subject, but they are sufficiently representative to enable the specialist, by referring to them, to cover the subject-matter. FICHTE, IMMANUEL HERMANN (originally HARTMANN) VON (1796-1879), German philosopher, son of J. G. Fichte, was born at Jena on July 18, 1796. Having held educational posts at Saarbrücken and Düsseldorf, in 1836 he became professor of philosophy at Bonn and in 1842 at Tübingen. He died at Stuttgart on Aug. 8, 1879. His most important writings are: *System der Ethik* (1850-53), *Anthropologie* (1856), *Psychologie* (1864-73), *Die theistische Weltansicht* (1873). Fichte's general views on philosophy are marked by an eclecticism, a predominantly historical treatment of problems and a conciliatory tone. He attempts to reconcile monism (Hegel) and individualism (Herbart) by means of theism (Leibnitz). He attacks Hegelianism for its pantheism, its lowering of human personality and imperfect recognition of the demands of the moral consciousness. God, he says, is not an absolute but an Infinite Person, whose nature it is to realize Himself in finite persons; these persons are objects of God's love, and He arranges the world for their good. Fichte, in short, advocates an ethical theism; in his conception of finite personality he recurs to something like the monadism of Leibnitz; and his insistence on moral experience is connected with his insistence on personality. Fichte evaluates previous systems by the adequateness with which they interpret moral experience. Thus he depreciates Hegel, praises Krause (panentheism) and Schleiermacher, and speaks respectfully of English philosophy. In his *Der neuere Spiritualismus* (1878), he employs arguments of a somewhat occult or theosophical cast, not unlike those of F. W. H. Myers. He edited the works and correspondence of his father.

See R. Eucken, "Zur Erinnerung I. H. F." in *Zeitschrift für Philosophie*, cx. (1897); C. C. Scherer, *Die Gotteslehre von I. H. F.* (1902). Some of his works were translated by J. D. Morell under the title of *Contributions to Mental Philosophy* (1860).

FICHTE, JOHANN GOTTLIEB (1762-1814), German philosopher, was born at Rammenau in Upper Lusatia on May 19, 1762, the son of a ribbon-weaver. After attending the celebrated school at Pforta, near Naumburg, he entered the university of Jena, but in 1781 went to Leipzig. During 1784-87 he acted as tutor in various families of Saxony, going to Zürich in 1788.

In 1790, he settled at Leipzig, and though reduced to literary drudgery, produced his *Aphorismen über Religion und Deismus* (unpublished, date 1790; *Werke*, i. 1-8), a species of Spinozistic determinism, regarded, however, as lying altogether outside the boundary of religion.

Fichte's *Letters* of this period attest the influence exercised on him by the study of Kant. The Kantian doctrine of the inherent moral worth of man harmonized with his own character, and his life became an effort to perfect a true philosophy, and to make its principles practical maxims. An abridgement of the *Kritik der Urtheilskraft* in a popular, intelligible form was begun, but left unfinished. A post as private tutor in Warsaw having proved unsuitable after a fortnight's trial, Fichte set out for Königsberg to see Kant. His first interview was disappointing, and he resolved to bring himself to the notice of the aged philosopher by a work in which the principles of the Kantian philosophy should be applied. Such was the origin of *Versuche einer Kritik aller Offenbarung* (Essay towards a Critique of all Revelation). The problem which Fichte dealt with in this essay was one not yet handled by Kant himself, the relations of which to the critical philosophy furnished matter for surmise. From the *Critique of Pure Reason* it was clear that for Kant speculative theology must be purely negative, while the *Critique of Practical Reason* as clearly indicated the view that

the moral law is the absolute content or substance of any religion. A critical investigation of the conditions under which religious belief was possible was still wanting. Kant having approved the essay and exerted his influence to procure a publisher, it appeared (1792). By an oversight Fichte's name on the title-page and the preface in which he spoke of himself as a beginner in philosophy, were omitted. The work was universally ascribed to Kant who, while correcting the mistake, commended the work, and Fichte's reputation was secured at a stroke.

The *Critique of Revelation* marks the culminating point of Fichte's Kantian period. The exposition of the conditions under which revealed religion is possible turns upon the absolute requirements of the moral law in human nature. Religion itself is the belief in this moral law as divine, and such belief is a practical postulate, necessary in order to add force to the law. The supernatural element in religion can only be the divine character of the moral law. Now, the revelation of this divine character of morality is possible only to a being in whom the lower impulses have been, or are, successful in overcoming reverence for the law. In such a case it is conceivable that a revelation might be given in order to add strength to the moral law. Religion ultimately then rests upon the practical reason, and expresses some want of the pure ego. In this conclusion we see the prominence assigned by Fichte to the practical element, and the tendency to make the requirements of the ego the ground for all judgment on reality. Having reached this point he had to press forward and leave the Kantian position.

Shortly after his marriage in 1793, Fichte published anonymously two remarkable political works, *Zurückforderung der Denkfreiheit von den Fürsten Europas* and *Beiträge zur Berichtigung der Urtheile des Publicums über die französische Revolution*. Of these the latter, which is much the more important, aimed to direct attention to the true nature of the French Revolution, to demonstrate how inextricably the right of liberty is interwoven with the very existence of man as an intelligent agent, to point out the inherent progressiveness of state arrangements, and the consequent necessity of reform or amendment. As in the *Critique of Revelation* so here the rational nature of man and the conditions necessary for its realization become the standard for critical judgment.

Towards the close of 1793 Fichte was called to succeed Reinhold at Jena as professor of philosophy. His success was instantaneous, and he lectured not only to his own class, but on general moral subjects to all students of the university. These general addresses, published as *Bestimmung des Gelehrten* (Vocation of the Scholar), were on a subject dear to Fichte's heart, the supreme importance of the highest intellectual culture and the duties incumbent on those who had received it. The completed Fichtean philosophy is contained in the writings of this period at Jena. A general introduction to the system is given in *Über den Begriff der Wissenschaftslehre* (On the Notion of the Theory of Science), 1794, and the theoretical portion is worked out in the *Grundlage der gesamten Wissenschaftslehre* (Foundation of the whole Theory of Science, 1794) and *Grundriss des Eigenthümlichen d. Wissenschaftslehre* (Outline of what is peculiar in the Theory of Science, 1794). To these were added in 1797 the masterly *First and Second Introduction to the Theory of Science*, and an *Essay towards a new Exposition of the Theory of Science*. The practical philosophy was given in the *Grundlage des Naturrechts* (1796) and *System der Sittenlehre* (1798). The last is probably the most important of all Fichte's works; apart from it, his theoretical philosophy is unintelligible.

During this period Fichte's academic career had been troubled by various storms, the last so violent as to put a close to his professorate at Jena. In 1798 Fichte, who had edited the *Philosophical Journal* since 1795, received from his friend F. K. Forberg (1770-1848) an essay on the "Development of the Idea of Religion." With much of the essay he entirely agreed, but thinking the exposition in many ways defective and calculated to create an erroneous impression, he prefaced it with a short paper *On the Grounds of our Belief in a Divine Government of the Universe*, in which God is defined as the moral order of the universe, the

eternal law of right which is the foundation of all our being. The cry of atheism was raised, and the electoral government of Saxony, followed by all the German states except Prussia, suppressed the *Journal* and demanded Fichte's expulsion from Jena. After his defences (*Appellation an das Publicum gegen die Anklage des Atheismus*, and *Gerichtliche Verantwortung der Herausgeber der phil. Zeitschrift*, 1799) Fichte threatened to resign in case of reprimand and much to his discomfort, his threat was taken as a request to resign.

Except for the summer of 1805 at Erlangen where he lectured, Fichte resided from 1799 to 1805 in Berlin, surrounded by friends, including Schlegel and Schleiermacher, and perfecting the *Wissenschaftslehre*. The chief works from this period are *Bestimmung des Menschen* (Vocation of Man, 1800), a book notable for beauty of style, richness of content, and elevation of thought; *Der geschlossene Handelsstaat*, 1800 (The Exclusive or Isolated Commercial State), a remarkable treatise, intensely socialist in tone, and inculcating organized protection; and *Sonnenklarer Bericht an das grössere Publicum über die neueste Philosophie*, 1801. In 1801 was also written the *Darstellung der Wissenschaftslehre*, published after his death. In 1804 were delivered the lectures entitled *Grundzüge des gegenwärtigen Zeitalters* (Characteristics of the Present Age, 1804), containing a most admirable analysis of the *Aufklärung*, tracing the position of such a movement of thought in the natural evolution of the general human consciousness, pointing out its inherent defects, and indicating as the ultimate goal of progress the life of reason in its highest aspect as a belief in the divine order of the universe. In 1805 and 1806 appeared the *Wesen des Gelehrten* (Nature of the Scholar) and the *Anweisung zum seligen Leben oder Religionslehre* (Way to a Blessed Life), the latter the most important work of this Berlin period. In it the union between the finite self-consciousness and the infinite ego or God is handled in an almost mystical manner, and the knowledge and love of God declared to be the end of life. The infinite God is the all; the world of independent objects is the result of reflection or self-consciousness, by which the infinite unity is broken up. God is thus over and above the distinction of subject and object; our knowledge is but a reflex or picture of the infinite essence. Being is not thought.

The French victories over the Prussians in 1806 drove Fichte from Berlin to Königsberg (where he lectured for a time), then to Copenhagen, whence he returned to the capital in Aug. 1807. From this time his published writings are practical in character; not till after the appearance of the *Nachgelassene Werke* was the shape of his final speculations known. We may here note the order of these posthumous writings as important for tracing the development of Fichte's thought. From 1806 we have the remarkable *Bericht über die Wissenschaftslehre* (*Werke*, vol. viii.), with its sharp critique of Schelling and from 1810 the *Thatsachen des Bewusstseyns* (published 1817) of which another treatment is given in lectures of 1813 (*Nach. Werke*, vol. i.). Of the *Wissenschaftslehre* we have, in 1812-13, four separate treatments contained in the *Nach. Werke*. Perhaps the most interesting are the lectures of 1812 on *Transcendental Logic* (*Nach. Werke*, i. 106-400).

From 1812 we have notes of two courses on practical philosophy, *Rechtslehre* (*Nach. Werke*, vol. ii.) and *Sittenlehre* (*ib.* vol. iii.). A finished work in the same department is the *Staatslehre* (published 1820). This gives the Fichtean utopia organized on principles of pure reason; in too many cases the proposals are identical with principles of pure despotism.

During these years, however, Fichte was mainly occupied with public affairs. In 1807 he drew up a plan for the proposed new university of Berlin, and in 1807-08 delivered at Berlin his noble addresses to the German people (*Reden an die deutsche Nation*), full of practical views on the only true foundation for national prosperity. From 1810 to 1812 he was rector of the new Berlin University.

During the great effort of Germany for national independence in 1813, Fichte lectured on the idea of a true war (*Über den Begriff eines wahrhaften Kriegs*, forming part of the *Staatslehre*). At the beginning of 1814, he was attacked with a

virulent hospital fever and died on Jan. 27, 1814. The philosophy of Fichte falls chronologically into the periods of Jena and Berlin, although there is no fundamental difference of philosophic conception. It is demonstrable by various passages in the works and letters that he never looked upon the early *Wissenschaftslehre* as containing his whole system; the modifications supposed to be due to other thinkers were from the first implicit in his theory. On only one point, the position assigned in the *Wissenschaftslehre* to the absolute ego, is there any obscurity; but the relative passages are far from decisive, and from the early work, *Neue Darstellung der Wissenschaftslehre*, unquestionably of the Jena period, one can see that from the outset the doctrine of the absolute ego was held in a form differing only in statement from the later theory.

Fichte's system cannot be compressed with intelligibility. We shall here note only three points: (a) the origin in Kant; (b) the fundamental principle and method of the *Wissenschaftslehre*; (c) the connection with the later writings. The most important works for (a) are the "Review of Aenesidemus," and the *Second Introduction to the Wissenschaftslehre*; for (b) the great treatises of the Jena period; for (c) the *Thatsachen des Bewusstseyns* of 1810.

(a) The Kantian system had opened up a truly fruitful line of philosophic speculation, the transcendental consideration of knowledge, or the analysis of the conditions under which cognition is possible. To Kant the fundamental condition was given in the synthetical unity of consciousness. The primitive fact under which might be gathered the special conditions of that synthesis which we call cognition was this unity. But Kant made no attempt to show that the said special conditions were necessary from the very nature of consciousness. Their necessity was discovered and proved in a manner which might be called empirical. Moreover, while Kant in a similar manner pointed out that intuition had special conditions, space and time, he did not show any connection between these and the primitive conditions of pure cognition. Closely connected with this remarkable Kantian defect was the doctrine that the matter of cognition is altogether *given*, and to be referred to the action upon us of a *Ding-an-sich*, absolutely beyond consciousness. While these hints towards a completely intelligible account of cognition were given by Kant, they were not reduced to system, and from the way in which the elements of cognition were related, could not be so reduced. Only in the sphere of practical reason, where the intelligible nature prescribed to itself its own laws, was there the possibility of systematic deduction from a single principle.

To the criticisms of Kant's theory of knowledge by Schultze (Aenesidemus) and Maimon, Fichte owed much, but his own activity went far beyond what they supplied. To complete Kant's work, to demonstrate that all the necessary conditions of knowledge can be deduced from a single principle, and consequently to expound the complete system of reason, that is the business of the *Wissenschaftslehre*. By it the theoretical and practical reason shall be shown to coincide; for while the categories of cognition and the whole system of pure thought can be expounded from one principle, the ground of this principle is scientifically, or to cognition, inexplicable, and is made conceivable only in the practical philosophy. The ultimate basis for the activity of cognition is given by the will. Even in the practical sphere, however, Fichte found that the contradiction, insoluble to cognition, was not completely suppressed, and he was thus driven to the higher view explicitly stated in the later writings.

(b) What, then, is this single principle, and how does it work itself out into system? To answer this one must bear in mind what Fichte intended by designating all philosophy *Wissenschaftslehre*, or theory of science. Philosophy is to him the rethinking of actual cognition, the *theory* of knowledge, the complete, systematic exposition of the principles which lie at the basis of all reasoned cognition. It traces the necessary acts by which the cognitive consciousness comes to be what it is, both in form and in content. It is the complete statement of the pure principles of the understanding in their rational or necessary order. But if complete, this *Wissenschaftslehre* must be able to deduce the whole organism of cognition from certain primary axioms, themselves incapable of

proof; only thus can we have a *system* of reason.

Of such primitive principles only three are thinkable—one perfectly unconditioned both in form and matter; a second, unconditioned in form but not in matter; a third, unconditioned in matter but not in form. Of these, the first to some extent conditions the other two, though these cannot be deduced from it or proved by it. The statement of these principles forms the introduction to *Wissenschaftslehre*.

The primitive condition of all intelligence is that the ego shall affirm or be aware of itself. This is the first pure act by which consciousness can come to be what it is. It is what Fichte called a Deed-act (*Thatandlung*); we cannot be aware of the process—the ego is not until it has affirmed itself—but we are aware of the result, and can see the necessity of the act by which it is brought about. In consciousness there is equally given a primitive act of op-positing, or contra-positing, formally distinct from the act of position, but materially determined, in so far as what is op-posed must be the negative of that which was posited. The non-ego—not, be it noticed, the word as we know it—is op-posed in consciousness to the ego. How this act of op-positing is possible and necessary only becomes clear in the practical philosophy, and even there the inherent difficulty leads to a higher view. But third, we have now an absolute antithesis to our original thesis. Only the ego is real, but the non-ego is posited in the ego. The contradiction is solved in a higher synthesis, which takes up into itself the two opposites. The ego and non-ego *limit* one another, or determine one another; and, as limitation is negation of part of a divisible quantum, in this third act, the divisible ego is op-posed to a divisible non-ego.

From this point onwards the course proceeds by the method already made clear. We progress by making explicit the oppositions contained in the fundamental synthesis, by uniting these opposites, and analysing the new synthesis until we reach an ultimate pair. Now, in the synthesis of the third act two principles may be distinguished:—(1) the non-ego determines the ego; (2) the ego determines the non-ego. As determined the ego is theoretical, as determining it is practical; ultimately the opposed principles must be united by showing how the ego is both determining and determined.

It is impossible to enter here on the steps by which the theoretical ego is shown to develop into the complete system of cognitive categories, or to trace the deduction of the processes (productive imagination, intuition, sensation, understanding, judgment, reason) by which the indefinite non-ego comes to assume the appearance of definite objects in the forms of time and space. All this evolution is the consequence of the determination of the ego by the non-ego. But it is clear that the non-ego cannot really determine the ego. There is no reality beyond the ego itself. The contradiction can only be suppressed if the ego opposes to itself the non-ego, places it as an *Anstoss* or plane on which its own activity breaks and from which it is reflected. Now, this op-positing of the *Anstoss* is the necessary condition of the practical ego, of the will. If the ego be a striving power, then of necessity a limit must be set by which its striving is manifest. But how can the infinitely active ego posit a limit to its activity? Here we come to the *crux* of Fichte's system, which is only partly cleared up in the *Rechtslehre* and *Sittenlehre*. If the ego be pure activity, it can only become aware of itself by positing some limit. We cannot possibly have any cognition of how such an act is possible. But as it is a free act, the ego cannot be determined to it by anything beyond itself; it cannot be aware of its own freedom otherwise than as determined by other free egos. Thus in the *Rechtslehre* and *Sittenlehre*, the multiplicity of egos is deduced, and with this deduction the first form of the *Wissenschaftslehre* appeared to end.

(c) But in fact deeper questions remained. We have spoken of the ego as becoming aware of its own freedom, and have shown how the existence of other egos and of a world in which these egos may act are the conditions of consciousness of freedom. But all this is the work of the ego, and follows if the ego comes to consciousness. We have therefore to consider that the absolute ego, from which spring all the individual egos, is not subject to

these conditions, but freely determines itself to them. In 1800 Fichte in the *Bestimmung des Menschen* defined this absolute ego as the infinite moral will of the universe, God, in whom are all the individual egos, from whom they have sprung. More precise utterances are given in the *Thatsachen des Bewusstseins* and in the later lectures. In them God is the absolute Life, the absolute One, who becomes conscious of himself by self-diremption into the individual egos. The individual ego is only possible as opposed to a non-ego, to a world of the senses; thus God, the infinite will, manifests himself in the individual and the individual has over against him the non-ego or thing. "The individuals do not make part of the being of the one life, but are a pure form of its absolute freedom." "The individual is not conscious of himself, but the Life is conscious of itself in individual form and as an individual." In order that the Life may act, though it is not necessary that it *should act*, individualization is necessary. "Knowledge is not mere knowledge of itself, but of being, and of the one being that truly is, viz. God. . . . This one possible object of knowledge is never known in its purity, but ever broken into the various forms of knowledge which are and can be shown to be necessary. The demonstration of the necessity of these forms is philosophy or *Wissenschaftslehre*" (*Thats. des Bewuss. Werke*, ii. 685).

It will escape no one (1) how the idea and method of the *Wissenschaftslehre* prepare the way for the later Hegelian dialectic, and (2) how completely the philosophy of Schopenhauer is contained in the later writings of Fichte. It is not to the credit of historians that Schopenhauer's debt should have been given so little notice.

BIBLIOGRAPHY.—Fichte's complete works were published by his son J. H. Fichte, *Sämmtliche Werke* (8 vols., Berlin, 1845), with *Nachgelassene Werke* (3 vols., Bonn, 1834); also *Leben und Briefwechsel* (2 vols., 1830, ed. 1862). (*Fichtes Briefwechsel* ed. H. Schultz, 2 vols. Leipzig, 1925.) Among translations are those of W. Smith, *Popular Writings of Fichte*, with *Memoir* (2 vols., 1848); A. E. Kroeger, portions of the *Wissenschaftslehre* (*Science of Knowledge*, 1889), the *Naturrecht* (*Science of Rights*, 1889); of the *Vorlesungen ü. d. Bestimmung d. Gelehrten* (*The Vocation of the Scholar*, by W. Smith, 1847); *The Vocation of Man*, by W. Smith (1848); *Address to the German Nation* by R. F. Jones and G. H. Turnbull (London, 1922).

FICHELGEBIRGE, a mountain group of Bavaria, forming the centre from which various mountain ranges radiate—the Elstergebirge, linking it to the Erzgebirge, in a north-east, the Frankenwald in a north-west, and the Böhmer Wald in a south-east direction. The streams which rise here are the Eger and the Saale, both flowing into the Elbe; the Weisser Main into the Rhine, and the Naab into the Danube. The chief peaks of the group are the Schneeberg (3,448 ft.) and the Ochsenkopf (3,356 ft.). The district is thickly wooded and is rich in mineral wealth, producing iron, vitriol, sulphur, copper, lead and many kinds of marble. A large population is supported by the iron mines, forges and blast furnaces, and by charcoal burning. Although surrounded by railways and crossed by the several lines, the Fichtelgebirge, owing to its raw climate and bleakness, is not much visited. The chief places of interest are Alexandersbad (a delightfully situated

watering-place) and the granite labyrinth of Luisenburg.

FICINO, MARSILIO (1433–1499), Italian philosopher and writer, and recognized as the earliest Platonist of the Renaissance, was born on Oct. 19, 1433, at Figline, in the upper Arno valley. His father, a physician of some eminence, was attached to Cosimo de' Medici. Cosimo perceived the boy's ability in literature and the physical sciences, and took him into his household with the intention of using his gifts in the propagation of Platonism and in the replacement of Christianity by a semi-pagan theosophy deduced from the writings of the later Pythagoreans and Platonists. To resuscitate the once so famous Academy of Athens Cosimo assembled men of letters for the purpose of Platonic disputation at certain regular intervals, and appointed Marsilio as hierophant and official expositor of Platonic doctrine.

Before he had begun to learn Greek, Marsilio entered upon the task of studying Plato, and while yet a novice, he wrote voluminous treatises on the great philosopher, which he afterwards burnt. In 1459 John Argyropoulos was lecturing on Greek language and literature at Florence, and Marsilio became his pupil. About 1482 he completed his translation of Plato, and published his *Theologia Platonica de immortalitate animae*, by which his rank as a philosopher must be estimated. This was followed by the translation of Plotinus into Latin (1486) and by a voluminous commentary (1491). Marsilio next devoted his energies to the translation of Dionysius the Areopagite, who had supreme attraction for the mystic and uncritical intellect of Ficino.

It is not easy to evaluate the services of Marsilio Ficino. As a philosopher, he was not original, his laborious treatise on Platonic theology being little better than a mass of ill-digested erudition. As an exponent of Plato he, like his contemporaries, suffered from the error of confounding Plato with the later Platonists. The whole of antiquity seemed precious in his eyes. Ficino was, moreover, a firm believer in planetary influences, and could not separate his philosophical from his astrological studies. His superstition led to his being accused of magic in 1489, but the good offices of Francesco Soderini, Ermolao Barbaro, and the archbishop Rinaldo Orsini saved him. The value of Ficino's translations, however, gave an impulse to Platonic studies in Italy, and through them to the formation of the new philosophy in Europe. Ficino differed from the majority of his contemporaries in that while he felt the charm of antiquity he never lost his faith in Christianity, or contaminated his morals. For him, as for Petrarch, St. Augustine was the model of a Christian student. The cardinal point of his doctrine was the identity of religion and philosophy. Philosophy consists in the study of truth and wisdom, and God alone is truth and wisdom; therefore philosophy is but religion, and true religion is genuine philosophy. Religion, indeed, is common to all men, but its pure form is that revealed through Christ. The Platonic doctrine was providentially made to harmonize with Christianity, in order that by it speculative intellects might be led to Christ.

Of Ficino's personal life there is but little to be said. Cosimo de' Medici gave him a house near S. Maria Nuova in Florence, and a little farm at Montevecchio, near his two friends, Pico at Querceto, and Poliziano at Fiesole. From his letters of 1474–94, published both separately and in his collected works, it may be gathered that nearly every living scholar of note was included among his friends. In 1473, Ficino took orders and received a canonry of S. Lorenzo. In spite of his weak health, he was assiduous in the performance of his duties, and in literary pursuits he was indefatigably industrious. His tastes were of the simplest; and while scholars like Filelfo were intent on extracting money from their patrons by flattery and threats, he remained so poor that he owed the publication of all his works to private munificence. For his Medici patrons Ficino always felt the liveliest gratitude. With Lorenzo he lived on terms of familiar, affectionate, almost parental intimacy, though in later years he did not shrink from uttering a word of warning and advice, when he thought that the master of the Florentine republic was too much inclined to pleasure. Ficino died at Florence in 1499.

Besides the works already noticed, Ficino composed a treatise on the Christian religion (1476), a translation into Italian of

Dante's *De monarchia*, a life of Plato, and numerous essays on ethical and semi-philosophical subjects. Vigour of reasoning and originality were not his characteristics as a writer. Only in familiar letters, prolegomena, and prefaces do we find the man Ficino, and learn to know his thoughts and sentiments unclouded by a mist of citations; these minor compositions have therefore a value, inasmuch as they throw light upon the learned circle gathered round Lorenzo in the golden age of humanism.

Montoriola (1925); W. Roscoe, *Life of Lorenzo de' Medici* (1796, etc.); Pasquale Villari, *La Storia di Girolamo Savonarola* (1859; Eng. trans., 1889); Von Reumont, *Lorenzo de' Medici* (Leipzig, 1874); and G. Saitta, *La Filosofia di M. Ficino* (Messina, 1924).

FICKSBURG, a town in the Orange Free State, near the Caledon river and Basutoland border; altitude 5,347 ft.; pop. (1921), 2,027 whites, 1,295 natives. It is situated on the main railway line from Natal to Bloemfontein. The town does a large trade with Basutoland. The surrounding District of Ficksburg is healthy, and produces considerable quantities of wheat, maize, and, in recent years, apples and plums.

FICTION: see NOVEL, ROMANCE.

FICTIONS, or legal fictions, in law, the term used for false averments, the truth of which is not permitted to be called in question. English law as well as Roman law abounds in fictions. Sometimes they are merely the condensed expression of a rule of law—e.g., the fiction of English law that husband and wife were one person, and the fiction of Roman law that the wife was the daughter of the husband. Sometimes they must be regarded as reasons invented in order to justify a rule of law according to an implied ethical standard. Of this sort seems to be the fiction or presumption that everyone knows the law, which reconciles the rule that ignorance is no excuse for crime with the moral commonplace that it is unfair to punish a man for violating a law of whose existence he was unaware. Again, some fictions are deliberate falsehoods, adopted as true for the purpose of establishing a remedy not otherwise attainable. Of this sort are the numerous fictions of English law by which the different courts obtained jurisdiction in private business, removed inconvenient restrictions in the law relating to land, etc. (See BARGAIN AND SALE.)

What to the scientific jurist is a stumbling-block is to the older writers on English law a beautiful device for reconciling the strict letter of the law with common sense and justice. Blackstone, in noticing the well-known fiction by which the court of king's bench established its jurisdiction in common pleas (viz. that the defendant was in custody of the marshal of the court), says, "These fictions of law, though at first they may startle the student, he will find upon further consideration to be highly beneficial and useful; especially as this maxim is ever invariably observed, that no fiction shall extend to work an injury; its proper operation being to prevent a mischief or remedy an inconvenience that might result from the general rule of law. So true it is that in *fictione juris semper subsistit aequitas*."

Fictions form one of the agencies by which, in progressive societies, positive law is brought into harmony with public opinion. The others are equity and statutes. Fictions in this sense include, not merely the obvious falsities of the English and Roman systems, but any assumption which conceals a change of law by retaining the old formula after the change has been made. It thus includes both the case law of the English and the *Responsa Prudentum* of the Romans. "At a particular stage of social progress they are invaluable expedients for overcoming the rigidity of law; and, indeed, without one of them, the fiction of adoption, which permits the family tie to be artificially created, it is difficult to understand how society would ever have escaped from its swaddling clothes, and taken its first steps towards civilization." (Sir H. Maine, *Ancient Law*.)

The bolder remedial fictions of English law have been to a large extent removed by legislation. Thus in ejectment cases the mysterious sham litigants have disappeared. The bond of entail can be broken without having recourse to the collusive pro-

ceedings of fine and recovery. Many fictions must have begun their career as metaphors concealing principles. The conception that a man-of-war is a floating island, or that an ambassador's house is beyond the territorial limits of the country in which he resides, was originally a figure of speech designed to set a rule of law in a striking light. It is then gravely accepted as true in fact, and other rules of law are deduced from it. On the other hand, obsolete principles may be classed as fictions when they are quoted as having a present existence. Thus the legal attributes of the king, and even of the House of Lords, are fictions. Again, many would hold that the assertion that any elective government really represents the people is hardly more than a fiction.

Bentham notices the comparative rarity of fictions in Scots law. As to fiction in particular, compared with the work done by it in English law, the use made of it by the Scottish lawyers is next to nothing. No need have they had of any such clumsy instrument. They have two others "of their own making, by which things of the same sort have been done with much less trouble. *Nobile officium* gives them the creative power of legislation; this and the word desuetude together the annihilative." And he notices aptly enough that, while the English lawyers declared that James II. had abdicated the throne (which everybody knew to be false), the Scottish lawyers boldly said he had forfeited it. (*Historical Preface to the second edition of the Fragment on Government*.)

FIDDLE, a popular term for the violin, derived from the names of certain of its ancestors. The word has first been traced in 1205 in Layamon's *Brut* (7002), "of harpe, of salterium, of fithel and of coriun." In Chaucer's time the fiddle was evidently a well-known instrument:

For him was lever [*i.e.*, liefer] have at his beddes hed
A twenty bokes, clothed in black or red,
Of Aristotle and his Philosophie,
Than robes riche or fidel or sautrie.

(Prologue, v. 298.)

The remote common ancestor of the fiddle is the *ketharah* of the Assyrians, the parent of the Greek cithara. The Romans are responsible for the word fiddle, having bestowed upon a kind of cithara—probably then in its first transition—the name of *fidiculae* (more rarely *fidicula*), a diminutive form of *fides*.

For the descent of the guitar-fiddle, the first bowed ancestor of the violin, through many transitions from the cithara, see CITHARA, GUITAR, and GUITAR-FIDDLE.

FIDEICOMMISSION, the name given in Roman law to a provision made by a testator directing his heir or legatee to enter on the inheritance and subsequently denude wholly or partially in favour of a third party. It was introduced formally in the time of Augustus, previously having had no legal force. As cases arose of a legatee failing to comply with this request a court was instituted, the *praetor commissarius*, with special powers of adjudication. See ROMAN LAW; SETTLEMENT, ACT OF.

FIDELITY GUARANTEE: see INSURANCE: *Miscellaneous*.

FIDENAE, an ancient town of Latium, situated about 6 m. north of Rome on the Via Salaria. It was for some while the frontier of the Roman territory and was often in the hands of Veii being of importance owing both to its command of the road, and to the existence here of a ferry over the Tiber, which lasted on into imperial times, serving to connect the property of Livia, on this bank with her villa near Saxa Rubra (*q.v.*). It is spoken of by classical authors as a place almost deserted in their time, though it was a post station. The site of the *arx* of the ancient town is to be sought on the hill on which Castel Giubileo stands, while the town lay on the opposite side of the highroad.

See Panaitescu in *Ephemeris Dacico-Romana*, ii. (1924) 416.

FIDENTIA, formerly **BORG SAN DOMNINO**, a town and Episcopal see of Emilia, Italy, province of Parma, 14 m. N.W. by rail from that town. Pop. (1921) town, 6,561; commune, 15,500. It occupies the site of the ancient Fidentia, on the Via Aemilia and resumed its name very recently. Here M. Lucullus defeated the democrats under Carbo in 82 B.C. Independent under Vespasian, it became subject to Parma. Its mediaeval name came from the martyrdom of S. Dominus under Maximian in

A.D. 304. The cathedral of S. Dominus is one of the finest Lombardo-Romanesque churches (11th-13th cent.). Near the town is the small brick church of S. Antonio del Viennese (13th century). The Palazzo Comunale is in Gothic-Lombard style of the 14th century. Fidentia is an agricultural centre.

FIDUCIARY, a term derived from Roman law and used in those foreign codes which have been chiefly influenced thereby. The idea, but hardly the law, corresponds with the English trustee. (See TRUST.) Many relations give rise to fiduciary obligations, and are even treated as occasioning trust obligations; e.g., parent and child, guardian and ward, principal and agent, etc. (See CHILDREN, PROTECTIVE LAWS; INFANT; PRINCIPAL AND AGENT.) Such obligations exist, however, independently of the true notion of trusteeship and are to be found where this notion is but rudimentary. They may rather be said, being in relation to property, to arise from quasi-contract, where not statutory.

FIDUCIARY ACCOUNTING, that branch of accounting pertaining to the accounts of one who undertakes to act in a fiduciary capacity, and, in general, any trustee who manages the affairs of a beneficiary. The fiduciary must account to a court of competent jurisdiction in the form and manner prescribed, if any. In rendering his account he will charge himself with the value of the assets with which he is intrusted, with the increase thereof as well as the income collected, if any; he will credit himself with the values of which he has divested himself, and with the decrease in assets, if any, as well as any proper expenses incurred in the administration of his trust. The balance will represent the assets in his possession at the date of the accounting. (J. T. MA.)

FIDUCIARY ISSUE. This term refers to that portion of a note issue, whether that of a Government or of a bank, which is not protected by a specific backing of metal or coin or assets capable of being converted into coin or bullion on demand. Thus, where no metallic reserve or other assets capable of automatic conversion into metal is kept, the whole issue is of a fiduciary character. The term does not imply that there are no assets of any kind maintained against the note, but only that such assets as are kept are of a non-metallic character—commercial bills of exchange, Government securities or floating debt due by Government. In the modern world where many central banks keep part of their "metallic reserves" not in their own vaults, but in the shape of deposits with other central banks or in the shape of short-dated bills payable in other gold-using countries, it is no longer possible to draw a sharp line of distinction between the fiduciary and the non-fiduciary portion of the total circulation, and what is regarded as "gold cover" has in such cases to be defined carefully by the legislation governing the issue. Strictly, the fiduciary circulation consists of all that part of the total issue which is not directly covered by gold coin or bullion in vault or such metal "earmarked" (i.e., held specifically segregated) on account of the issue in some other institution.

It does not follow that the mere maintenance of a cash reserve adds to the safety of a note issue. To do so the whole of the note issue must be convertible; i.e., the reserve against the notes must be used in case holders desire them to be redeemed. Unless the note is effectively convertible, an increase in the total note issue accompanied by an increase in the total reserve will not necessarily prevent "over issue," i.e., a total of notes so large that its value falls in terms of the standard of value. A fiduciary issue may retain its full value provided it is limited in quantity, even without any metallic reserve at all.

The fiduciary amount may be fixed absolutely in amount: i.e., the issuer may be prohibited from issuing more than a certain volume of uncovered notes. This is the traditional British principle. Or the note issue may be based upon the principle of a fixed absolute amount, the proportion of covered to uncovered notes being left to the discretion of the issuing authority, which is the traditional French principle. Or the note issue may be based upon the idea of a proportionate reserve without any absolute limit to the total, a minimum proportion of cash indirectly fixing the amount of the fiduciary issue. The system of proportional reserves and of a fixed fiduciary amount may be partly combined by

providing that if the total issue exceeds the sum of the fully covered notes and the fixed fiduciary amount (the so-called tax-free contingent) the excess shall be taxable. Lastly in the modern world the principle of the elastic reserve proportion is gaining ground rapidly: the reserve proportion is allowed to vary (thus varying the fiduciary portion), subject to provisions by which the tendency to over-issue is checked by a scale of taxation rising as the reserve proportion falls. (T. E. G.)

FIEF, a feudal estate in land, land held from a superior (see FEUDALISM). The word is the French form, which is represented in Mediaeval Latin as *feudum* or *feodum*, and in English as "fee" or "feu" (see FEE). The A.Fr. *feoffer*, to invest with a fief or fee has given the English law terms "feoffee" and "feoffment."

FIELD, CYRUS WEST (1819-1892), American capitalist, projector of the first Atlantic cable, was born at Stockbridge, Mass., on Nov. 30, 1819. He was a brother of David Dudley Field. In 1840 he went into the paper business for himself at Westfield, Mass., but almost immediately became a partner in E. Root and Co., wholesale paper dealers in New York city. In 1841 he formed the firm of Cyrus W. Field and Co. In 1853 he travelled with Frederick E. Church, the artist, through South America. In 1854 he became interested in the project of Frederick Newton Gisborne (1824-92) for a telegraph across Newfoundland; and he was attracted by the idea of a trans-Atlantic telegraphic cable, as to which he consulted S. F. B. Morse and Matthew F. Maury, head of the National Observatory at Washington. With Peter Cooper, Moses Taylor (1806-82), Marshall Owen Roberts (1814-80) and Chandler White, he formed the New York, Newfoundland and London Telegraph Company. He and John W. Brett, who was now his principal colleague, approached Sir Charles Bright (q.v.) in London, and in Dec. 1856, the Atlantic Telegraph Company was organized by them in Great Britain, a Government grant being secured of £14,000 annually for Government messages. Similar grants were made by the United States Government. Unsuccessful attempts to lay the cable were made in Aug. 1857, and in June 1858; the complete cable was laid between July 7 and Aug. 5, 1858; but in October the cable became useless, owing to the failure of its electrical insulation. In July 1866, after a futile attempt in the previous year, a cable was laid and brought successfully into use. From the Congress of the United States he received a gold medal and a vote of thanks, and he received many other honours both at home and abroad. In 1877 he bought a controlling interest in the New York Elevated Railroad Company, controlling the Third and Ninth avenue lines, of which he was president in 1877-80. He worked with Jay Gould for the completion of the Wabash railway, and bought *The New York Evening Express* and *The Mail* and combined them as *The Mail and Express*. In 1879 Field suffered financially by Samuel J. Tilden's heavy sales of "Elevated" stock, but lost much more in the great "Manhattan squeeze" of June 24, 1887, when Jay Gould and Russell Sage, who had been supposed to be his backers, forsook him. Field died in New York on July 12, 1892.

See the biography by his daughter, Isabella (Field) Judson, *Cyrus W. Field, His Life and Work* (1896); H. M. Field, *History of the Atlantic Telegraph* (1866); and Charles Bright, *The Story of the Atlantic Cable* (1903).

FIELD, DAVID DUDLEY (1805-1894), American lawyer and law reformer, was born in Haddam, Conn., on Feb. 13, 1805. He graduated at Williams college in 1825, and settled in New York city, where he was admitted to the bar in 1828. Interested in the reformation of the common law, he visited Europe in 1836 and thoroughly investigated the courts, procedure and codes of England, France and other countries. Upon his return, he worked for 40 years to bring about a codification of the common law procedure in the United States. In 1846 he published a pamphlet, "The Reorganization of the Judiciary," which had its influence in persuading the New York State Constitutional Convention of that year to report in favour of a codification of the laws. Finally, in 1847, he was appointed head of a State commission to revise the practice and procedure. The code of civil procedure was reported and enacted in 1848, and by April 6, 1857, the code of civil and

criminal procedure was completed and enacted.

Eventually, the civil code with some changes was adopted in 24 states, and the criminal code in 18; the civil code of procedure was adopted in England and Ireland in 1873, and later by several British colonies. In 1857 Field became chairman of a state commission for the reduction into a written and systematic code of the whole body of law of the state. Although this codification was adopted only in small part, it has served as a model after which most of the law codes of the United States have been constructed. In 1866 he proposed to the British National Association for the Promotion of Social Science a revision and codification of the laws of all nations. For an international commission of lawyers he prepared *Draft Outlines of an International Code* in 1872, which resulted in the foundation of the International Law Association at Brussels in 1873. During his life, Field gave considerable attention to politics, and from Jan. to March 1877 served out in Congress the unexpired term of Smith Ely, elected mayor of New York city. His congressional career, though short, was crowded with activity. He died in New York city April 13, 1894.

Part of his numerous pamphlets and addresses were collected in his *Speeches, Arguments and Miscellaneous Papers* (1884-90). See also the *Life of David Dudley Field* (1898), by Rev. Henry Martyn Field.

FIELD, EUGENE (1850-1895), American poet, was born in St. Louis (Mo.), Sept. 3, 1850. Because of an error, Field thought, until the last years of his life, as is shown by his autobiographical notes and by the date appended to his birthday poem "Thirty-Nine," that the day of his birth was Sept. 2. As a young child, after his mother's death, he was taken by relatives to Amherst (Mass.), where he passed his boyhood. Though educated mainly in a private school, he attended in turn Williams and Knox colleges and the University of Missouri, remaining but a few months in each and taking no degree. His early inclination was toward the stage, but his facility as a satirical writer, which was manifest even in early youth, gave him ready employment in journalism, first on a St. Louis newspaper and later in turn on newspapers in St. Joseph, Kansas City and Denver. For them he wrote brilliant paragraphs, fantastic sketches, and humorous verse. In 1883 he joined the editorial staff of *The Chicago Daily News*.

From that time until his death, Nov. 4, 1895, he contributed to *The Daily News* paragraphs on a great variety of subjects, humorous and satirical articles, serious poems and light verse. At first his work was notable mainly for its caustic humour and audacity, his fancy leading him into grotesque inventions that ostensibly set forth absurd views or described preposterous actions of well-known persons. A collection of these effusions was republished in a volume (*Culture's Garland*, Boston, 1887). The book was received with such favour that its author was encouraged to attempt serious work. In 1888 his best known poem "Little Boy Blue" appeared. There followed many others, a considerable number of which were written for or about children, and these attained instant popularity. In 1889 was privately printed a collection of his poems entitled *A Little Book of Western Verse* (Chicago), along with a volume of his prose stories, *A Little Book of Profitable Tales* (Chicago). A year later these books were published in New York, and had a large sale. Other volumes of poems followed: *A Second Book of Verse* (1892); *With Trumpet and Drum* (1892); and *Love Songs of Childhood* (1894). In 1892 *Echoes from the Sabine Farm* was privately printed. The rhymed translations from Horace composing its contents were partly by Field and partly by his brother Roswell (1851-1919). The year after Field's death, his collected works were published in ten volumes, and in 1901 two more volumes were added. His poems of childhood have maintained their hold on the popular heart. In general, his poems are marked by a fine metrical quality, but not by originality of thought or expression. His prose writings are of distinctly less merit, being somewhat laboured and mechanical. Chief of his prose writings in a lighter vein is *The Love Affairs of a Bibliomaniac*. (C. H. D.)

See *The Life of Eugene Field*, by Slasen Thompson (1927), *Eugene Field's Creative Years*, by Charles H. Dennis (1924), and the introductions to the several volumes of Field's collected works.

FIELD, FREDERICK (1801-1885), English divine and biblical scholar, was born in London and educated at Christ's hospital and Trinity College, Cambridge, where he obtained a fellowship in 1824. He published an emended and annotated text of Chrysostom's *Homiliae in Matthaeum* (Cambridge, 1839), and some years later contributed to Pusey's *Bibliotheca Patrum* (Oxford, 1838-70), a similarly treated text of Chrysostom's homilies on Paul's epistles. The scholarship displayed in both of these critical editions is of a very high order. In 1839 he had accepted the living of Great Saxham, in Suffolk, and in 1842 was presented by his college to the rectory of Reepham in Norfolk. He resigned in 1863, and settled at Norwich, in order to devote his whole time to study. Twelve years later he completed the *Origenis Hexaplorum quae supersunt* (Oxford, 1867-75), now well known as *Field's Hexapla*, a text reconstructed from the extant fragments of Origen's work of that name, together with materials drawn from the *Syro-hexaplar* version and the *Septuagint* of Holmes and Parsons (Oxford, 1798-1827). Field was appointed a member of the Old Testament revision company in 1870.

FIELD, JOHN (1782-1837), English musical composer and pianist, was born at Dublin on July 26, 1782. He came of a musical family, his father being a violinist, and his grandfather the organist in one of the churches of Dublin. From the latter the boy received his first musical education. When a few years later the family settled in London, Field became the favourite pupil of Clementi, whom he accompanied to Paris for the purpose of showing off the Clementi pianos, and later, in 1802, on his great concert tour through France, Germany and Russia. Field appeared in public in most of the great European capitals, and remained in St. Petersburg as a teacher of music when Clementi returned to England. His marriage with a French lady of the name of Charpentier was anything but happy, and had soon to be dissolved. Field made frequent concert tours to the chief cities of Russia, and in 1820 settled permanently in Moscow. In 1831 he came to England for a short time, and for the next four years led a wandering life in France, Germany and Italy. In Naples he fell seriously ill, and lay several months in the hospital, till a Russian family discovered him and brought him back to Moscow. There he died on Jan. 11, 1837. Field's seven concertos for the pianoforte are now forgotten; so are his quartets for strings and pianoforte. But some of his "nocturnes" for the pianoforte, a form of music highly developed, if not actually created by him, still live because of their continuous flow of beautiful melody. They were indeed Chopin's models. Field's execution on the pianoforte was nearly allied to the nature of his compositions; Moscheles, who heard Field in 1831, speaks of his "enchancing legato, his tenderness and elegance and his beautiful touch." An admirable essay by Liszt on Field is prefixed to a volume of the latter's nocturnes published by Schuberth & Co. in 1837.

FIELD, MARSHALL (1835-1906), American merchant, was born at Conway (Mass.), on Aug. 18, 1835. At the age of 17 he became a clerk in a dry goods store at Pittsfield (Mass.). In 1856 he removed to Chicago, where he became a clerk in the large mercantile establishment of Cooley, Wadsworth and Company. In 1860 he was admitted to a junior partnership. In 1865, with Potter Palmer (1826-1902) and Levi Z. Leiter (1834-1904), he organized the firm of Field, Palmer and Leiter, which subsequently became Marshall Field and Company. Under Field's management the annual business of the firm increased to more than \$40,000,000 in 1895. He died in New York city on Jan. 16, 1906. Field's public benefactions were numerous; notable among them being his gifts to the University of Chicago and to the Field Columbian Museum of Natural History.

FIELD, NATHAN (1587-1633), son of the Puritan rector of Cripplegate, London, was baptized on Oct. 17, 1587. He was a schoolboy at St. Paul's grammar school when he became (1600) one of the "children" of the Chapel Royal, and he remained connected with that company or the Queen's Revels until 1613, when the company was absorbed in the Lady Elizabeth's players. He played in Ben Jonson's pieces, and took the title rôle in Chapman's *Bussy d'Ambois* (1606). He left the company in 1615, and joined the King's Men. He seems to have left this company in

1619, and about this time married. A Nathaniel Field died on Feb. 20, 1633, in the parish of Blackfriars, but he had a brother named Nathaniel, to whom the entry probably refers. His name comes 17th on the list of 26 players, "the principal actors in all these Playes," in the 1623 Shakespeare folio.

The two plays printed under Nat. Field's name are: *A Woman is a Weathercock* (acted 1609?, pr. 1611) and *Amends for Ladies* (acted 1611, pr. 1618). To Field is assigned a share in Massinger's *Fatal Dowry* (pr. 1632), and he is credited by some critics with a share in some of the Beaumont and Fletcher plays.

His two plays were reprinted in J. P. Collier's *Five Old Plays* (1833), in Hazlitt's edition of *Dodsley's Old Plays*, and in *Nero and other Plays* (Mermaid series, 1888), with an introduction by A. W. Verity.

FIELD, STEPHEN JOHNSON (1816–1899), American jurist, was born at Haddam (Conn.), on Nov. 4, 1816. In 1837 he graduated from Williams college. He then studied law, and in 1841 was admitted to the New York bar. He practised in New York until 1849, when he removed to California. In 1850 he was chosen a member of the first State legislature of California, in which he drew up and secured the enactment of two bodies of law known as the Civil and Criminal Practices Acts. In the former Act he embodied a provision regulating and giving authority to the peculiar customs, usages, and regulations voluntarily adopted by the miners in various districts of the State for the adjudication of disputed mining claims. This Act was the foundation of the jurisprudence respecting mines in the country. In 1857 Field was elected justice of the California supreme court, of which he became chief justice in 1859. In 1863 he was appointed by President Lincoln a justice of the U.S. supreme court. In this capacity he was conspicuous for fearless independence of thought and action in his opinion in the test oath case, and in his dissenting opinions in the legal tender, conscription, and "slaughter house" cases. His anti-slavery sympathies forced him to accept Lincoln's doctrine of coercion, and led him to act with the Republican party. In 1873 he was a member of the commission which revised the California code, and of the electoral commission in 1877 (*q.v.*), voting in favour of Tilden. In Aug. 1889, as a result of a ruling in the course of the Sharon-Hill litigation, a notorious conspiracy case, he was assaulted in a California railway station by Judge David S. Terry, who in turn was shot and killed by a United States deputy marshal appointed to defend Justice Field. Field retired from the supreme court on Dec. 1, 1897 after a service of 34 years and six months, and died in Washington on April 9, 1899.

His *Personal Reminiscences of Early Days in California*, originally privately printed in 1878, was republished in 1893 with George C. Gorham's *Story of the Attempted Assassination of Justice Field*.

FIELD, WILLIAM VENTRIS FIELD, BARON (1813–1907), English judge, was born at Fielden, Bedfordshire, on Aug. 21, 1813. He was called to the bar at the Inner Temple in 1850, after having practised for some time as a special pleader. He had for some time been the leader of the Midland circuit, when in Feb. 1875, on the retirement of Mr. Justice Keating, he was raised to the bench as a justice of the queen's bench. When the rules of the Supreme Court 1883 came into force in the autumn of that year, the lord chancellor selected him to sit continuously at Judges' Chambers, in order that a consistent practice under the new rules might as far as possible be established. This he did for nearly a year, and his name will always be associated with the settling of the details of the new procedure, which finally did away with the former elaborate system of "special pleading." In 1890 he retired from the bench, and was raised to the peerage as Baron Field of Bakeham, becoming at the same time a member of the privy council. He died at Bognor on Jan. 23, 1907.

FIELD, open country as opposed to woodland, and particularly land for cultivation divided up into separate portions by hedges, banks, stone walls, etc. (Ger. *Feld*, Dutch *veld*, from the Gr. root *πλατός*, broad). The word is applied to a region with particular reference to its products, as oil-field, gold-field, etc. There are many applications of the word; thus from the use of the term for the place where a battle is fought,

or for the whole theatre of war, come such phrases as to "take the field" for the opening of a campaign, "in the field" of troops engaged in the operations of a campaign (also "field-fortifications" and "field-day"). A "field-officer" ranks above a captain and below a general (*see* OFFICERS); a field marshal is the highest general officer in the British and many European armies (*see* MARSHAL). "To field" in certain games is to stop or catch the ball played by the "in" side. "The field" is used in hunting, for those taking part in the sport, and in racing for all the horses entered for a race, and, in such expressions as "to back the field," is confined to all the horses with the exception of the "favourite." A common application of the word is to a wide surface as of the sky or sea, or of such physical phenomena as ice or snow, or to the ground on which armorial bearings are displayed (*see* HERALDRY), or the "ground" of a flag; thus the white ensign of the British navy has a red St. George's cross on a white "field." The word is used in science of the sphere of observation or of operations, and has come to be almost equivalent to a department of knowledge. In physics it is particularly applied to the area influenced by some agent, e.g., the magnetic or electric field. A "field-glass" is the name given to a binocular glass used in the field (*see* BINOCULAR INSTRUMENT). *See* also COMMONS; FIELD SYSTEM.

FIELD ARTILLERY, light guns suitable for active operations in the field (O.Fr. *artiller*, to arm). Field artillery forms the bulk of the artillery with an army; its main tasks are to assist the other arms, such as infantry and tanks, to close with the enemy, to give covering fire, to assist in repelling counter-attacks, and to carry out anti-tank defence. The British field artillery is organized into brigades of four batteries, of which three are armed with a gun of 3.3-in. calibre, firing a shell weighing 18lb., and one with a howitzer of 4.5-in. calibre, firing a shell weighing 35lb. The field artillery of other armies corresponds fairly closely to this pattern, though the howitzer does not in all cases form part of their armament. (*See* further ARTILLERY.)

United States.—In the U.S. army the field artillery consists of light, horse, siege and mountain artillery. Its purpose is to assist the other branches, especially the infantry, on the field of battle. It is organized into brigades of two or more regiments, composed of two to three battalions containing two to three batteries. For purposes of tactical employment it is divided into division artillery (light), corps artillery (medium), army artillery and GHQ reserve artillery (all types). The primary mission of division artillery is the close and immediate support of the infantry of its division. The most important function of corps artillery is counterbattery. The function of army artillery is reinforcement of divisional and corps artillery within their respective zones, and long range fire deep into the enemy's territory. Army artillery organically contains only a headquarters, an ammunition train and one anti-aircraft artillery brigade; but to meet its varied needs, artillery of all types is temporarily allotted from GHQ reserve.

FIELD DAY, a name given in the United States to a group picnic organized by large institutions. City schools, trade organizations, corporations employing a large number of workers and city departments such as the police, make a practice of devoting a part or the whole of a day in spring to the field day. It is usually held in an outlying city park, or, in some cases, in State or private amusement centres lying at some distance from the city. The main attraction on field day is a series of athletic contests, such as races, jumping contests and baseball games between individual groups within the organization. Medals, trophies and banners are given to the winners. In the case of corporations, the officers give awards to the winning employees. Police field days have some of the characteristics of military manoeuvres and sham battles, and serve to demonstrate to the public the high degree of training and discipline to which the police of large cities are subject.

FIELDFARE, *Turdus pilaris*, one of the thrushes and a common winter visitor to the British Isles. In spring it nests in Scandinavian and Russian birch-forests, migrating to southern Europe, western Asia and northern Africa in winter. It is gre-

gamous in habit and somewhat resembles the missel thrush (*T. viscivorus*) in appearance. The nest, placed high up in a tree, is similar to that of the blackbird (*T. merula*), as are the eggs. The song is low and poor, the call note harsh and loud. It feeds upon worms, slugs and insect larvae, adding, in hard weather, hips, haws and other berries.

Structurally very like the fieldfare, but differing in appearance and habits is the North American *Planesticus migratorius*, called the robin (*q.v.*), because of its ruddy breast and familiar habits. It is essentially a migrant, ranging from Greenland to Guatemala and almost everywhere an abundant species. It has a pleasant song and is of great service as a destroyer of insects.

FIELD GLASSES: see BINOCULAR INSTRUMENTS.

FIELDING, ANTHONY VANDYKE COPLEY (1787–1855), commonly called Copley Fielding, English landscape painter (son of a portrait painter), became at an early age a pupil of John Varley. He confined himself almost exclusively to water colours. In 1810 he became an associate exhibitor in the Water-colour Society, in 1813 a full member and in 1831 president. He died at Worthing in March 1855. Specimens of his work are to be seen in the water-colour gallery of the Victoria and Albert Museum, London, of dates ranging from 1829 to 1850.

FIELDING, HENRY (1707–1754), English novelist and playwright, was born at Sharpsham Park, near Glastonbury, Somerset, on April 22, 1707. The family removed later to East Stour, Dorset. His father, Lieut. Edmund Fielding, was a grandson of the earl of Desmond, who belonged to the younger branch of the Denbigh family. Sarah Fielding was Henry's sister. Up to the time of his mother's death Fielding was educated by a clergyman named Oliver, and then went to Eton, probably as an oppidan. If we may believe his first biographer, Arthur Murphy, he left Eton "uncommonly versed in the Greek authors, and an early master of the Latin classics"—a statement which should perhaps be qualified by his own words to Sir Robert Walpole in 1730:

Tuscan and French are in my head;
Latin I write, and Greek—I read.

Winnington and Hanbury-Williams were among his friends at Eton. The chief, however, was George, later Baron, Lyttelton, of Frankley.

When Fielding left Eton is unknown. But in Nov. 1725 he was staying at Lyme and apparently bent on carrying off, if necessary by force, a local heiress, Miss Sarah Andrew, whose fluttered guardians promptly hurried her away, and married her to some one else (*Athenaeum*, June 2, 1883). He consoled himself by translating part of Juvenal's sixth satire into verse as "All the Revenge taken by an injured Lover." After this he must have lived the usual life of a young man about town, and probably at this date improved the acquaintance of his second cousin, Lady Mary Wortley Montagu, to whom he inscribed his first comedy, *Love in Several Masques* (Drury lane, Feb. 1728). Almost immediately afterwards (March 16), Fielding entered himself as "Stud. Lit." at Leyden university. He had apparently left before the annual registration of Feb. 1730; and in Jan. 1730 he brought out a second comedy at the newly-opened theatre in Goodman's Fields. Like its predecessor, the *Temple Beau* was an essay in the vein of Congreve and Wycherley. His chief dramatic successes, from a critical point of view, the *Author's Farce* (1730) and *Tom Thumb* (1730, 1731), were burlesques; and he was also fortunate in two translations from Molière, the *Mock Doctor* (1732) and the *Miser* (1733). On Nov. 28, 1734, he married Charlotte Craddock of Salisbury, at St. Mary Charcombe, near Bath (see *Macmillan's Magazine*, April 1907), and early in 1735, he seems for a time to have retired with his bride to his old home at East Stour. Early in March, 1736, he was back again managing the Haymarket theatre with a so-called "Great Mogul's Company of English Comedians." This new enterprise opened well. The first piece (produced on March 5) was *Pasquin, a Dramatick Satire on the Times*. Its success was unmistakable; and its author followed it up by the *Historical Register for the Year 1736*, of which the effrontery was even more daring. But the Licensing Act of 1737, which restricted the number of theatres, rendered the lord chamberlain's licence an indispensable preliminary to

stage representation, and—in a word—effectually put an end to Fielding's career as a dramatist.

As a means of support he reverted to the profession of the law and, in Nov. 1737, he entered the Middle Temple. He also did a good deal of literary work, the best known of which is contained in the *Champion*, a "News-Journal" of the *Spectator* type, undertaken with James Ralph, whose poem of "Night" is made notorious in the *Dunciad*. On June 20, 1740, Fielding was called to the bar, and occupied chambers in Pump Court. He travelled the Western Circuit, and attended the Wiltshire sessions. Although, with the *Champion*, he professed, for the time, to have relinquished periodical literature, he still wrote at intervals, but whether he actually wrote the famous *Apology for the Life of Mrs. Shamela Andrews* (1741), a parody of *Pamela*, as Richardson certainly thought, is quite uncertain.

In any case it is certain that the reading of *Pamela* was the point of departure of Fielding's first novel, *Joseph Andrews*, which made its appearance in Feb. 1742. Professing, on his title-page, to imitate Cervantes, Fielding set out to cover *Pamela* with Homeric ridicule by transferring the heroine's embarrassments to a hero, supposed to be her brother. Fielding saw in *Pamela*'s virtue a certain interested quality, and he set out to parody her in the person of Joseph. But the element of parody fell speedily into the background as its author warmed to his theme. His secondary speedily became his primary characters, and Lady Booby and Joseph Andrews do not interest us now as much as Mrs. Slipslop and Parson Adams—the latter a personage who ranks in literature with Sterne's "Uncle Toby" and Goldsmith's "Vicar." By the time he had reached his second volume, he had convinced himself that he had inaugurated a new fashion of fiction; and in a remarkable "Preface" he announced his discovery. Postulating that the epic might be "comic" or "tragic" prose or verse, he claimed to have achieved what he termed the "Comic Epos in Prose," of which the action was "ludicrous" rather than "sublime," and the personages selected from society at large, rather than the restricted ranks of conventional high life. His plan was happily adapted to his gifts of humour, satire, and above all, irony. That it was matured when it began may perhaps be doubted, but it was certainly matured when it ended. Indeed, except for the plot, which, in his picaresque first idea, had not preceded the conception, *Joseph Andrews* has all the characteristics of *Tom Jones*.

Fielding's next important publication was the three volumes of *Miscellanies* issued by subscription in April, 1743. These comprised some early poems, some essays, a Lucianic fragment entitled a *Journey from this World to the Next*, and, last but not least, occupying the entire final volume, the *History of the Life of the late Mr. Jonathan Wild the Great*. It is probable that *Jonathan Wild* was actually written before *Joseph Andrews*. Taking for his ostensible hero a well-known thief-taker, who had been hanged in 1725, Fielding proceeds to illustrate, by a mock-heroic account of his progress to Tyburn, the general proposition that greatness without goodness is no better than badness. He will not go so far as to say that all "Human Nature is Newgate with the Mask on"; but he evidently regards the description as fairly applicable to a good many so-called great people. Irony (and especially irony neat) is not a popular form of literary art; and the remorseless pertinacity with which Fielding pursues his demonstration is to many readers discomfiting and even distasteful. Yet—in spite of Scott—*Jonathan Wild* has its softer pages; and as a purely intellectual conception it is not surpassed by any of the author's works. It will always remain a masterpiece of that irony which is based on understatement.

The events of Fielding's life, both before and after the publication of *Jonathan Wild*, are obscure. He had become early a martyr to gout, and his wife died of fever in his arms, leaving him for the time so stunned and bewildered by grief that his friends feared for his reason. In Nov. 1747 he married his wife's maid, Mary Daniel, at St. Benet's, Paul's Wharf; and in Dec. 1748 he was made a principal justice of peace for Middlesex and Westminster, an office which put him in possession of a house in Bow street, and £300 per annum "of the dirtiest money upon earth."

BY GRACIOUS PERMISSION OF HIS MAJESTY KING GEORGE V.

A CONTEMPORARY PAINTING OF THE FIELD OF THE CLOTH OF GOLD

The famous camp between Guînes and Ardres, where Henry VIII. of England and Francis I. of France met on June 7, 1520. After nearly three weeks of tournaments, pageants, masques and banquets, they parted, having achieved no political results of importance. The illustration shows part of a painting attributed to Vincenzo Volpe, now in Hampton Court Palace

Meanwhile he had intermittently occupied himself in composing his second great novel, *Tom Jones; or, the History of a Foundling*, published in June 1748, with a dedication to Lyttelton. In *Tom Jones* Fielding systematically developed the "new Province of Writing," in which he had made a beginning in *Joseph Andrews*. He paid closer attention to the construction and evolution of the plot; he elaborated the initial essays to each book, which provide part of its unending interest, and he compressed into his work the flower and fruit of his forty years' experience of life. He has, indeed, no character quite up to the level of Parson Adams, but his Westerns and Partridges, his Allworthys and Blifils, his parson Thwackum and his philosopher Square, have the inestimable gift of life. He drew pictures of ordinary humanity with absolute truthfulness, neither extenuating nor disguising defects and shortcomings. The bill of fare he provided for his readers he himself describes in the introduction of Book I. as "human nature" pure and simple. As for his purpose and method he says in the Dedication: "I have employed all the wit and humour of which I am master, in the following history; wherein I have endeavoured to laugh mankind out of their favourite follies and vices." Incidentally he produced a "document" of unrivalled excellence on the social life of the England of his time. *Tom Jones* follows the picaresque method of *Joseph Andrews*, but its plot, in spite of great diversity of its characters, the amazing variety of its incidents, and its vast canvas, has a unity and coherence which is new.

Much of *Tom Jones* has become classic. Take the dispute between Thwackum and Square on the definition of honour. "Honour," says Thwackum, "is not therefore manifold, because there are many absurd opinions about it; nor is religion manifold, because there are various sects and heresies in the world. When I mention religion, I mean the Christian religion; and not only the Christian religion, but the Protestant religion; and not only the Protestant religion, but the Church of England. And when I mention honour, I mean that mode of Divine grace which is not only consistent with, but dependent upon, this religion; and is consistent with and dependent upon no other. . . ." Square in his reply says: "I have asserted that true honour and true virtue are almost synonymous terms, and they are both founded on the unalterable rule of right, and the eternal fitness of things; to which an untruth being absolutely repugnant and contrary, it is certain that true honour cannot support an untruth."

Meanwhile Fielding was taking his duties as a magistrate seriously. His novels provide abundant evidence of his view of the unsatisfactory state of penal law and administration. In May 1749 he became chairman of quarter sessions at Westminster, and in 1751 he wrote an *Enquiry into the Causes of the late Increase of Robbers, etc.* These preoccupations left their mark on his next novel, *Amelia* (1752), which is more concerned with social problems and popular grievances than its forerunners. *Amelia* herself, in whom, as in the Sophia Western of *Tom Jones*, he reproduced the traits of his first wife, is certainly, as Johnson admitted, "the most pleasing heroine of all the romances," and the drawing of Dr. Harrison and Col. Bath is admirable. But in 1749 he had been dangerously ill, and his health was visibly breaking. The £1,000 which Millar is said to have given for *Amelia* must have been painfully earned. Pamphlets, and an unsuccessful newspaper adventure, the *Covent Garden Journal* (1752) followed. He resigned his post as magistrate, and tried various specifics to restore his health. Finally he tried change to a warmer climate. On June 26, 1754, he accordingly left for Lisbon, in the "Queen of Portugal." The protracted discomforts of the sick man and his family on this voyage are narrated at length in the posthumous tract entitled the *Journal of a Voyage to Lisbon*, which, with a fragment of a comment on Bolingbroke's then recently issued essays, was published in Feb. 1755 "for the Benefit of his (Fielding's) Wife and Children." Reaching Lisbon at last in Aug. 1754, he died there two months later (Oct. 8) and was buried in the English cemetery, where a monument was erected to him in 1830. *Luget Britannia gremio non dari fovere natum* is inscribed upon it.

There is but one absolutely authentic portrait of Fielding, a

familiar outline by Hogarth, executed from memory for Andrew Millar's edition of his works in 1762. It is the likeness of a man broken by ill-health and affords but faint indication of the handsome Harry Fielding, who in his salad days "warmed both hands before the fire of life."

Fielding has a great place in the history of the English novel. If the *Spectator* is to be credited with foreshadowing the characters of the novel, Defoe with its earliest form, and Richardson with its experiments in sentimental analysis, it is to Henry Fielding that we owe its first accurate delineation of contemporary manners. He owed much to *Don Quixote*, something to the best of the French picaresque novels, but his own creation was different from that of any of his predecessors. Fielding drew a large and varied picture of life, of people neither good nor bad, but human, with a tolerance and a humour and penetrating insight which are rare enough. Fielding is the master from whom Dickens and Thackeray and the great school of the English Victorian novelists descend.

Among the many editions of Fielding's works may be mentioned those edited by A. Murphy (1762), G. Saintsbury (1893), E. Gosse (1899); the Harvard University edition (1903), etc. For Fielding's life-work see A. Dobson, *Fielding* (1907); G. M. Godden, *Henry Fielding* (1910); W. L. Cross, *The History of Henry Fielding* (Yale, 1918); F. T. Blanchard, *The Novels of Fielding* (Yale, 1926).
